## SELECTIONS OF CHOICE & LOVELY PLANTS

BELOW we note a few selections of plants from our glass-houses. All are in the best possible health, and the choice of variety is on the most liberal scale.

Cacti, 6 distinct and desirable sorts .. 9/- and 12/-  
Caladiums, 12 superb varieties .. 12/-, 18/-, and 30/-  
Cannas, 12 gorgeous varieties .. 9/-, 12/-, and 18/-  
Carnations (Tree), 12 choice varieties .. 7/6 to 21/-  
Coleus, 12 pretty and ornamental varieties .. 4/-  
Crotons, 12 superb and choice sorts .. 24/- to 30/-  
Epiphyllums, 12 select sorts .. 15/-, 18/-, and 24/-  
Fuchsias, 12 choice and lovely sorts .. 3/-  
Geraniums, Zonal, 12 superb sorts, 4/-, 6/-, and 9/-  
Double, 12 superb sorts .. 4/-, 6/-, and 9/-  
Ivy Leaf, 12 superb varieties .. 3/6  
Scented-leaved, 6 varieties .. 2/6  
Gloxinias, 12 grand varieties .. 9/- to 24/-  
Palms, 12 in 6 choice varieties .. 9/- to 30/-  
Pelargoniums, Show, 12 grand sorts 9/- to 18/-  
Salvias, 12 in 6 varieties .. 3/6  
Table Plants, 6 to 12 varieties, 24/-, 30/-, 42/-, & 60/-

A COMPLETE LIST OF  
INDOOR AND OUTDOOR PLANTS  
IS CONTAINED IN OUR CATALOGUE.

CLIBRANS ALTRINCHAM  
MANCHESTER

## Grand New Climbing Rose DOROTHY PERKINS.

The Floral Committee were unanimous in giving this an AWARD OF MERIT when shown by me at the Royal Horticultural Society's Meeting at the Drill Hall, on May 20th.

*See Report in this Paper of May 22nd.*

This beautiful novelty is a hybrid between Rose Wichuriana and Madame Gabriel Luizet; the flowers are produced in large clusters of a lovely shell-pink with white centre. Besides being a good climber, it can be grown as a fine pot plant.

Orders booked now for autumn delivery, which will be executed in strict rotation. Good plants in 48-pots, 3/6 each; extra strong, in 24's, 5/6 each.

Special List of other New Roses on application.

E. POTTEN,  
Camden Nurseries, CRANBROOK, KENT

## HARDY WATER LILIES

AND OTHER AQUATIC PLANTS.

Great Speciality.—New and Old beautiful varieties delivered by Parcel Post during the Spring and the Summer, which are the best seasons for planting them.

B. LATOUR MARLIAC, Nurseryman,  
TEMPLE-SUR-LOT (Lot-et-Garonne), FRANCE  
Lowest Prices. Catalogue free on application.

## LONDON FERN NURSERIES,

LOUGHBORO' JUNCTION, LONDON, S.W.—Stove and Green-house Ferns, large and small, in var., Aralias, Grevilleas, Cyperus, Ficus, Ericas, Palms, Dracaenas, Aspidistras, Roses, Azaleas, Carnations, Crotons, Camellias, Chrysanthemums, Cyclamen, Bouvardias, Asparagus, Araucarias, Solanums, Aspidistras, Cinerarias, Genistas, Marguerites, Geraniums, Primulas, Orange Trees, &c. Trade, send for Wholesale List. Special Retail Catalogue, free.—J. E. SMITH.

## Flowers and Showers.

THE soaking, and often ungenial, showers of this May and June have given us reason for various thoughts. Amongst these was the position many plants occupy as indicators of rain or atmospheric changes. Garden flowers are not wholly dependent upon the weather; wild flowers are, and to the majority of these a moist season is more favourable than a dry one, especially if the showers are unaccompanied by cold winds. Some people assert that both farmers and gardeners prefer a wet summer to a very dry one, but I do not feel sure about that. Very many things get irretrievably damaged which would have got on fairly well had the spring favoured us with its wonted showers. In all countries, throughout much of human history, prognostics of foul or fair weather obtainable from plants have been noticed, particularly where the climate is variable. Indeed, we come across persons who have greater faith in them than in any barometer.

Even yet, we find those who hold to beliefs we may consider to be matters for ridicule—such as the idea that the moon has an influence upon plants. Tylor tells us that the earlier gardeners never attempted sowing, planting, or grafting without scrupulous attention to the increase or waning of the moon. In Devonshire, still, the moon is considered when some fruits are being picked; Apples are supposed to "shrump" should they be gathered during the waning of our satellite. The Mushroom, too, of lowly growth, was said to own the moon's influence. With its waning, plants languished or decayed; to ensure their success, they should be sown and set between the new moon and the full. Of course, this was sometimes awkward to the old gardeners, because the moisture and

READERS are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

dryness of the weather had also to be taken into account. Evidently opinions differed, for good old Tusser writes:—

Sow Peas and Beans in the wane of the moon,  
Who soweth them sooner he soweth too soon.

There is an old belief, not traceable to any particular country, that a profusion of flowers during May is an indication of a rainy season, showers of flowers being followed by actual showers. It has been the case this year, that the rainfall towards the end of May has had its successor in June, but the plentifulness of wild flowers in May seems to have chiefly to do with the moisture of early spring and the absence of very rough winds. Yet should the rains of May and June have cloudy, not sunshiny intervals, vegetation is apt to develop an abundance of leaves and stalks, but few flowers. We see this exemplified in gardens and fields as well as along the lanes. Hence, one old saying, that a dripping June keeps things in tune may be queried. Again, we have also a local saying, that a wet May means a fruitful year; this may depend partly upon the soil. Considering the matter with regard to our insect foes, it is certain that the foliage of plants can stand their attacks better in a moist season than in a dry one. On the other hand, we have the fact that a dry summer kills many insects, while they are juvenile larvæ or in the chrysalis state, so that is a set-off. Several of the old authors remark that it is a good sign if Midsummer Day is quite free from rain.

The great naturalist, Linnæus contrived what he called a "floral clock," by which flowers indicated certain hours of the day and night, by their expansion or closing. Many species, both wild and garden, are remarkably regular, only those of course which open and shut with the daylight vary in time with the length of day. One division differs from the rest, because the flowers are "meteoric," or in modern phrase, they are meteorological, that is, they perceive and register the passing changes of our atmosphere. Such flowers notice the warmth or chilliness of the air, and the approach or presence of rain. When the weather is unsettled, many of those flowers which should welcome the daylight remain with closed petals, the common Daisy is a familiar instance. Should the garden Marigold fail to open by seven on a summer morning, rain may be expected before long. The familiar Dandelion closes entirely when the heat is excessive, and the stalks of its down contract during wet weather, thus avoiding the dispersion of the seeds when their after-growth might be interfered with. No sure sign of rain is given by the shutting up of some flowers, which are affected by the passage overhead of a heavy cloud, that is carrying rain to another district, but occasionally they happen to be right.

No ear hath heard, no tongue can tell,  
The virtues of the Pimpernel.

This popular name belongs to several native plants, but it is supposed that the old rhyme above applies to the Scarlet Pimpernel (*Anagallis arvensis*) a lovely flower, yet at times conspicuous upon some meadows. From years of observation, I would back this plant against any artificial barometer as a rain prophet, for I never knew any shower, but a very trifling one, occur on a day when this Pimpernel is open in the morning. Hence, in the time of early English plant names, it received that of the Shepherd's or Poor Man's Weather-glass. Though it must be remembered that the flowers usually close at two or three in the afternoon, irrespective of the weather. The plant was esteemed because it was believed to have the power of drawing out splinters, and curing brain diseases, also it was good against witchcraft. A still commoner plant,

the wayside Chickweed, comes near the Pimpernel in accuracy. Lord Bacon, who was a keen observer of natural objects, noted that if the flower of it is fully expanded no rain comes for four hours or more; should it entirely shut up, he warns the traveller to put on his overcoat. Most of the species of Trefoil or Clover contract their leaves at the approach of bad weather, be it rain or only rough wind. Such, too, is the habit of the pretty Woodsorrels.

One sign of rain is the flight of the downy seeds from the Coltsfoot, Dandelion, and the Thistle tribe generally, when there is no wind. Formerly, the heads of the Fuller's Teazle were hung up in cottages with free access to the air. If the weather was likely to be cold and windy, these heads turned smoother, and against moisture they closed their prickles. Then other plants, fresh or dried, were brought indoors, under the belief that they gave protection against lightning or thunderbolts. Wreaths of wild Chamomile were held efficacious, also a branch of the Elder or the Bay (*Laurus nobilis*). Amongst curious beliefs connected with rain, was the one that showers could be produced by setting Fern on fire, which was carried into practice upon commons and in copses.

Everybody has seen the effects of hoar frost upon trees during the winter months, how, after a cold night, the ice, that has clothed branches and twigs in white array, descends when the sun comes out, as a shower of moisture, perhaps to freeze again below. Besides the winter droppings, there are other instances of raining trees. Many of them (also some plants) have the power of absorbing a large quantity of water, which collects at the points where leaves join branches, and branches the stem; this is finally discharged by drops, which gives the tree all the appearance of producing a shower. Of course, some droppings from the trees are caused by the work of insects.—J. R. S. C.

## Edinburgh Botanic Garden Sixty Years Ago.

"Immediately upon his entrance to the grounds the stranger is struck with the luxuriance and vigour of the evergreens, to the cultivation of which Mr. William McNab, the able curator, has devoted much attention. On the southern side of the garden there is a large collection of hardy plants arranged according to the Natural System of Jussieu, such as Ferns, Grasses, labiate, cruciform, leguminous, umbelliferous, and composite plants, &c. Close to this collection is a small pond, containing Rushes, Water Lilies, &c., and a ditch containing those plants, which thrive best in such a situation. To the north of this arrangement is a collection of British plants arranged according to the Linnæan or artificial system, with the name attached to each species. On the eastern side are the plants indigenous to Scotland, and on the west a few which are found in England and Ireland, but not in Scotland. A little to the east of this British arrangement is a collection of Roses. Proceeding northwards we come to a general collection of hardy evergreens, chiefly exotic; to the east of which is a collection of medicinal plants, with the names and Natural Orders attached: We then reach the greenhouses. These contain a large collection of exotics, which thrive admirably. The western division contains Heaths, Epacridæ, Dryandras, Proteas, Grevilleas, Diosmas, &c., while in the eastern division we have a stove with northern exposure in which epiphytes are cultivated with great success. In the other greenhouses of the front range there are many interesting plants, among which may be mentioned Plantains, which bear fruit well, Papaw tree, Pitcher plants, Papyrus, Indiarubber Fig, Cacti, Cinnamon, Tea plants, Amaryllids, Aroids, Euphorbias, &c. In front of this range of houses is a piece of ground on which many of the plants of warmer regions are cultivated in the open air, being carefully protected during winter. Behind these houses is a smaller range in which numerous seedlings are cultivated, and a large Palm house, about 45ft high, in which are found Plantains and Bananas, Sago Palms, Fan Palms, Cabbage Palms, Date Palms, Cocoa-nut trees, Sugar-cane, Bamboos, Screw Pines, &c. The houses are heated partly by hot water and partly by steam. From the top of the boiler house there is a fine view of Edinburgh. Against the high northern wall of the garden, having a south aspect, many valuable exotics are trained, as Magnolias, Acacias, Edwardsias, Camellias, Myrtles, Eucalypti, &c. The garden embraces an extent of 14½ English acres." — ("Blackie's Picturesque Tourist of Scotland, 1846.")

**Odontoglossum crispum var. Lady Jane.**

At the exhibition of the Royal Horticultural Society, in the Inner Temple Gardens, on May 28, this handsome and distinctive variety received a First Class Certificate. It was shown by J. Wilson-Potter, Esq., Elmwood, Croydon. The flowers are large and of good substance, the petals being marked with lines of rich chestnut that run almost horizontally to the apex; the lip, too, is distinctive. The sepals are flushed with mauve-pink over white. It is a very sweet Odontoglot.

**The Week's Cultural Notes.**

*Cattleya superba* is one of the very finest in this genus, and, unlike the majority of species, it is found to be difficult of culture. Newly imported specimens move off well for a few years, but there soon comes a time when a falling off in the size of the growths and flower is discernible, and it is then only a question of time before the plant ceases to be of value. Without a doubt it is in the atmospheric treatment we are wrong with this superb Orchid. The plants are easy enough to establish, and attain a good hold upon the home of their adoption, but they don't "hold on," to use a customary phrase.

**Odontoglossum crispum Lady Jane.**

Heat they must have, and light and moisture in plenty, and this we can give. What we cannot arrange is the constantly changing yet ever correct atmosphere that obtains in their native habitat. Beds of fermenting leaves in the house have been tried, and also chemicals of various kinds in the hot water troughs, but these are only very paltry attempts to imitate Nature, and in the matter of keeping "miffy" species in health we are as far off now as ever. I have been most successful with *C. superba* in pots filled nearly to the rim with crocks and charcoal, the little compost given consisting of three parts of sphagnum to one of peat.

The plants were grown on an elevated stage in a span-roofed house, their companions being *Dendrobiums* and that other peculiar species *Epidendrum bicornutum*. When the flower buds showed in the point of the sheath the *Cattleyas* were removed to the *Cattleya* house, and as the blossoms opened to a still drier and cooler structure, to conserve them. A few weeks of this treatment so hardened and ripened the bulbs that when again returned to the growing quarters in autumn they seldom started out of season in the declining temperature.

For several years—as long in fact as they were under my charge—these plants continued satisfactory, and flowered very freely every year. Some growers pin their faith to blocks for *C. superba*, but when a plant is sufficiently vigorous to attach itself freely to pots and baskets of compost, why confine it to the very poor nutriment obtainable from wood blocks? Cork blocks lined with moss are better, as the roughness of this material is liked by the roots, and so are many of the devices made with cork, but I have always found the usual pot or basket preferable to either.—H. R. R.

## Coronation Rose Show and Conference.

(Concluded from page 554, last vol.)

In connection with our report of the exhibits and the papers read at the conference held under the auspices of the Royal Horticultural Society at Earl Ilchester's seat in Kensington last week, we furnish a number of characteristic views of the beautiful home just referred to. For a full description of the garden and a brief history of Holland House the reader is directed to our issue for March 14, 1901.

The proceedings at the exhibition last week were as satisfactory as could have been hoped for, after the consequential news which oppressed us all on Tuesday afternoon, the 24th ult. The gate takings on the first day were over £200, we believe, and the show received distinguished patronage, the Duchess of Connaught, the Sultan of Perak, and others of distinction being present. On neither day was there any music to enliven the interest in things, but the superb collections within the tents, and the delightfully sunny weather and breeze outside, were sufficient to prevent strangers from being dissatisfied. The officials of the Society each and all deserve recognition for their part in the conference arrangements.

Mr. R. C. Notcutt, Broughton Nursery, Ipswich, staged *Arctotis grandis*, a new half-hardy annual, with silvery ray petals and dark disc; he also had a collection of hardy flowers.

Messrs. Jones and Sons, from Shrewsbury, brought Sweet Peas, and tastefully arranged them in vases. Here our selection was Black Knight, Mrs. Eckford, Gorgeous Lovely, Hon. Mrs. Kenyon, Emily Henderson, Splendens, and Her Majesty.

Messrs. Wallace and Co., Kilnfield Gardens, Colchester, showed a gorgeous group of hardy flowers on the grass. Each variety was set up in great armfuls, and thus their true character was brought strikingly forward.

Messrs. Wm. Cutbush and Son, Highgate, London, N., set up a huge exhibit of the new *Marguerite* named Coronation, which received an award of merit on June 10. We cannot too highly commend this plant to those who have much cutting to do. Their new scarlet flowering *Pelargonium*, Caroline Schmidt, contrasted well with the *Marguerite*.

Messrs. Dobbie and Co., Rothesay, had intended to show Sweet Peas, but these were unadvanced, and the *Aquilegias* which took their place were a charming substitute. These were arranged in glasses, and each variety shown distinctively. A large number of them are now possessed of sweet and bright colours, giving them additional merit. Their Giant *Mimuli* were indeed large and finely formed, as well as richly coloured. Show Pansies and *Violas* in bunches occupied about half of the exhibit, the choice varieties of the former being Lord Roberts, Duke of Argyle, Miss Neil, Colonel Buchanan, K. Stirling, Jas. Dodds, Kate Dow, and W. B. Child. Their *Violas* included Nellie Currie, Tessy, General Baden-Powell, Bronze Kintore, Lark, and Princess Ida.

Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, though almost strangers to London, came with magnificent double-flowered tuberous *Begonias*, whose quality in all respects must be recorded as second to none we have seen.

The new Rose, Dorothy Perkins, whose merits we have already described on more than one occasion, was staged in fine style by Messrs. Cutbush and Son, of Highgate.

Mr. A. W. Wade, Riverside Nurseries, Colchester, was strong in *Ixias*, *Irises*, and other hardy flowers.

Mr. M. Pritchard, nurseryman, Christchurch, Hants, had in his collection the very beautiful *Iris Pseudo-Acorus foliis variegata*, *Pyrethrum florentina*, pale pink, *Iris spuria*, and a handsome assortment of single and double *Pæonies*. Everything was in excellent condition.

Messrs. Paul and Son, The Old Nurseries, Cheshunt, N., contributed, among other things, *Verbascum olympicum* (the whole plant cut and staged); also the trailing *Tropæolum polyphyllum*, *Centaurea montana rubra*, *Campanula mirabilis*, *Thalictrum rubrum*, *Gunnera scabra* (so suitable for the water's edge as a foliage plant), together with *Heuchera sanguinea splendens*, *Hesperis matronalis plena*, *Lupinus arboreus*, and other hardy flowers. *Aquilegias* and *Pæonies* were strongly in evidence. A good collection.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, were represented by a group of select greenhouse flowering plants, including *Metrosideros floribunda*, *Erica Cavendishi*, *Boronia elatior*, *Erica tricolor*, *Hydrangeas*, *Carnations*, and *Anthuriums*, all in grouplets, and each fine.

The Alderborough strain of St. Brigid *Anemones* were staged in better style than hitherto, even although they have been seen in such great excellence at earlier London shows. They are indeed magnificent.

Mr. Ed. S. Towell, Hampton Hill, Middlesex, sent a design of the Royal crown made of the scarlet flowers of the Zonal *Pelargonium Fire Dragon*.

Messrs. John Peed and Son, West Norwood, S.E., staged Gloxinias in many beautiful and delicate colours, and the plants were well grown. A group of Sweet Peas came from Mr. C. Aubrey Watts, 30, Mark Lane, E.C., but they were too closely packed. Messrs. Jackman staged hardy flowers, the table being much too high.

#### Orchids.

Orchids did not form nearly such a show as they do at the Temple Gardens, but a number of handsome collections were exhibited. Mr. Jeremiah Colman (gardener, W. P. Bound), Gatton Park, Reigate, contrived a wonderfully sweet display of Odontoglossums with particularly good crispums, *Miltonia vexillaria*, *Masdevallias*, *Cattleyas*, and other things.

Messrs. Sander and Sons, St. Albans, had a number of magnificent Odontoglossums, and staged in a new style, with all the pots and pedestals embedded in green moss. Their *Lælio-Cattleya Memoria Baroness Schröder*, is of excellent form, with good dark purple lip and pale segments. Their Odontoglossum *Alexandræ* Princess Louise, carrying nine large and finely formed flowers, is a good red spotted variety. *O. Harvengtense* Princess Margaret is an excellent subject of large size and finely marked with brown. It received an Award of Merit. A most graceful Odontoglossum *Alexandræ* Princess Patria, with nine huge flowers nicely blotched. Some of their white crispums were distinctive and very fine, but the whole group was most choice.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, were particularly strong in *Cattleyas*, showing *C. Wagneri* in magnificent form, together with *Lælio-Cattleya Ascania*, creamy; *L.-C. Pallas*, *L.-C. Canhamiana*, and the beautiful *Lælia purpurata*, carrying a dozen large flowers.

M. A. A. Peeters, Brussels, staged *Lælio-Cattleya* x *The Coronation*, a monster hybrid between *L. tenebrosa* and *C. Mossiæ*. The lip is violet purple, other petals and sepals deep mauve. Mr. H. Little staged a well-flowered plant of *Lælia grandis tenebrosa*. Sir Trevor Lawrence, Bart., received a Cultural Commendation for *Habenaria rhodochila*, with orange-scarlet flowers.

Messrs. Stanley, Ashton, and Co., Southgate, N., contributed Odontoglossums and a variety of other subjects, including *Lycaste Deppei*, well flowered; *Cattleya* x *Miss Harris superba*, an extraordinarily fine flower, coloured deep purplish-rose, and of splendid form. It received a First Class Certificate. They had many other fine things.

Messrs. Charlesworth and Co., Heaton, Bradford, furnished an immense and handsome display of Odontoglossums, *Oncidiums*, hybrid *Cattleyas*, and the choicest of other Orchids. Messrs. J. Cowan and Co., Gateacre, Liverpool, staged Odontoglossums, *Cattleyas*, *Lælias*, *Cypripediums*, &c.; and Sir Frederick Wigan, Bart., had also a good exhibit.

#### Roses.

The Rose competitions, as everybody expected, were exceedingly slack, many of the classes being empty and others having only one entry. Such was the case with classes 3 and 4, in the first of which A. Hill Gray, Esq., Beaulieu, Newbridge, Bath, received first prize with fair blooms of the following. Back row: Mrs. E. Mawley, Comtesse de Nadaillac, Medea, Auguste Comte, Souv. d'Elise Vardon, The Bride, Anna Olivier, and Maman Cochet. Second row: Hon. E. Gifford, Golden Gate, Maréchal Niel, Catherine Mermet, Princess of Wales, Princess Beatrice, Souv. d'un Ami, Jean Ducher. Third row: Caroline Kuster, Bridesmaid, Marie Van Houtte, White Maman Cochet, Madame Bravy, Reine Marie Henriette, Souv. de S. A. Prince, and Cleopatra.

The Rev. F. R. Burnside, Great Stanbridge Rectory, Rochford, Essex, was first in class 4 with twelve distinct blooms, including Viscountess Folkestone, Marquis Litta, Antoine Rivoire, Niphetos, Catherine Mermet, Souv. d'Elise Vardon, La France, White Lady, Comtess of Caledon, Mad. Cadeau-Ramey, Mme. Van Houtte, and Cleopatra.

In class 5, for six blooms, distinct, Mr. T. B. Gabriel, Elinstrad, Woking, led with fair blooms. Rubens was good. Gen. Jacqueminot small, but good; Souv. de S. A. Prince, and Mrs. Ed. Mawley was also a good flower. His other was Marquis Litta. Second place fell to Mr. R. W. Bowyer, Hertford Heath, Hertford, with a good Mrs. W. J. Grant and White Lady. The other four—Viscountess Folkestone, Marquis Litta, Lady Mary Fitzwilliam, and Maréchal Niel—were only fair. Third came Mr. G. W. Cook, Muswell Hill Road, Highgate. Six entered. No one entered in class 6.

In class 7, for forty-eight blooms, distinct, open, the Silver Cup fell to Messrs. F. Cant and Co., Braiswick Rose Gardens, Colchester, with weak blooms, including the varieties Mrs. W. J. Grant, Rainbow, Marquis Litta, Mon. Noman, Gustave Piganeau, Ulster, Rev. Alan Cheales, and Clara Watson. Second row: Lady Roberts, Souv. de Pres. Carnot, Dr. Sewell, Maréchal Niel, Marie Bauman, Lady Mary Fitzwilliam, and Crown Prince. Front row: Mme. G. Luizet, W. J. Bennett, Bessie Brown, Mme. Montet, Grace Darling, Marie Van Houtte, Camoens, and Souv.

de M. Eugène Verdier. Messrs. Prior and Co., Colchester, came second with a very fair set of blooms, the best being Souv. de S. A. Prince, Maréchal Niel, and Gustave Piganeau.

In class 8, for forty-eight single blooms, distinct, open, the first prize of a Silver Cup fell to Mr. George Prince, Longworth, Berks, who staged a wonderfully even set, though somewhat ragged. In the back row he had Caroline Testout, Rubens, Viscountess Folkestone, R. M. Henriette, Souv. de S. A. Prince, Souv. d'un Ami, and Medea. Second row: Clara Watson, Grace Darling, Maréchal Niel, Capt. Hayward, Hon. Edith Gifford, and Comtesse de Nadaillac. Front row: Mme. de Watteville, Duke of York, Marie Van Houtte, La France, Catherine Mermet, Maman Cochet, The Bride, and Mrs. W. J. Grant. Messrs. R. Harkness and Co., Hitchen, Herts, were second with poor blooms, the best being Ulrich Brunner, and Helen Keller. Mr. A. Hill Gray led in class 9, but the succeeding class was without a supporter.

In class 11 Mr. T. B. Gabriel led with weak blooms; and second, Mr. R. W. Bowyer. No award was given in class 12 for six blooms of any one variety; and two entered in class 13. Here Mr. G. Prince, of Longworth, Berks, was first with one of the best stands in the show. This was for eighteen blooms in distinct varieties, and he staged Comtesse de Nadaillac, Niphetos, The Bride, Maréchal Niel, Bridesmaid, Princess of Wales, White Maman Cochet, Souv. d'Elise Vardon, Amazone, Mme. Cusin, Marie Van Houtte, Maman Cochet, Medea, Rubens, Souv. de S. A. Prince, Anna Olivier, and Jean Ducher. The second prize fell to Messrs. D. Prior and Son, Colchester, with poor flowers.

Class 14, first Mr. Frank Cant, Colchester; second Messrs. G. Cooling and Sons, Bath; third B. R. Cant and Sons, Colchester. Class 15, first O. G. Orpen, Esq., Colchester; no second. Class 16, first Messrs. G. Cooling and Sons, Bath. Class 17, no entry. Class 18, first Messrs. B. R. Cant and Sons, Colchester; second Mr. G. Prince, Longworth, Berks. Class 19, first Messrs. B. R. Cant and Sons, Colchester; second Messrs. G. Cooling and Sons, Bath. Class 20, first Mr. Frank Cant, Colchester; no second. Class 21, no entry. Class 22, second Messrs. Paul and Son, Cheshunt; no first prize awarded. Class 23 (new Roses), first—Gold Medal, Mr. Frank Cant, Colchester, H.T. Lady Roberts; second—Gold Medal, Messrs. Paul and Son, Cheshunt, Weeping rugosa alba. Class 24, first Mr. O. G. Orpen, Colchester; second Miss B. Langton, Raymead, Hendon. Class 25, first Mr. C. Turner, Slough; second Messrs. Paul and Son, Cheshunt. Class 26, first Mr. G. Prince, Longworth, Berks. Class 27, no competition.

#### New Roses.

*H.T. Lady Battersea* (F. Cant and Co.).—A lovely Rose of exquisite form, strong in build, and outstanding in a collection. The stout, smooth petals are coloured a reddish apricot, shading to cream at the edges. It may be likened to the Sunrise type of flower. Gold Medal.

*Weeping rugosa alba* (Paul and Son).—This Rose is remarkable for its pendent habit of growth, combining also the vigour of the type. The prickles are very prominent, but the foliage is smaller, as it seemed, than the erect rugosa. The flowers are large and pure white, the petals irradiating from the disc, and being contortions. Gold Medal.

#### Trees and Shrubs.

In the open air Messrs. J. Laing and Sons, Forest Hill, made a pretty display of foliage and flowering plants, the Acers being conspicuous, while a collection of flowering shrubs, was represented by Rhododendrons and Kalmias.

Messrs. W. Fromow and Sons, Chiswick, sent a semicircular group of Acers, Bambusas, and Lilioms, edged with well grown plants of *Aralia pentaphylla variegata*. The group was well arranged and certainly appreciated.

A most effective exhibit was arranged in the open air by Messrs. Jas. Veitch and Sons, Limited, Chelsea, consisting of a group of Aquilegias of beautiful colours, with some fine spikes of *Eremurus robustus*, backed with some fine specimens of Bamboos.

Mr. J. Russell, Richmond Nurseries, Richmond, made a fine group of foliage plants, chiefly of a variegated character, the Acers, Ivies, Ligustrums, and various variegated Conifers making a beautiful exhibit.

Messrs. Cutbush and Son, Highgate, had an enormous collection of clipped and trained trees arranged in the open air, plants of all sizes and fantastic shapes being represented.

Messrs. J. Cheal and Sons, Crawley, made a fine exhibit of hardy foliage and flowering plants, the Acers and Conifers with their young foliage being most attractive, the whole being well arranged.

A grand collection of Acers came from Messrs. T. Cripps and Son, Tunbridge Wells. The collection was well arranged, and the plants beautifully grown; altogether a most effective exhibit.

#### Certificates and Awards of Merit.

*Asparagus myriocladus* (R. Greenfield, Jun.).—"A novelty from South Africa." The branchlets are deep green and plume-

like. Mr. R. Greenfield, Jun., 17, Bath Street, Leamington Spa. First Class Certificate.

*Begonia Masterpiece* (Blackmore and Langdon).—A bold, large double flower, coloured deep, rich, glowing crimson. The substance is good, and also the habit of the plant. Award of Merit.

*Begonia Miss Dorothy Hardwick* (Blackmore and Langdon).—The form is not so good in this double tuberos. The petals are slightly fringed, silvery at the edges, and coloured deep rose-pink. Blooms full and high in centre. Award of Merit.

*Begonia Professor Lanciani* (Blackmore and Langdon).—A double tuberos, of magnificent proportions, coloured scarlet shaded bronze, very bright and showy. Award of Merit.

*Cattleya x Miss Harris var. superba* (Stanley, Ashton, and Co.).—(C. Schilleriana and C. Mossiæ).—Magnificent flowers; sepals and petals purplish rose, lip of a bright rosy carmine, with darker veining. First Class Certificate.

*Cattleya x Prince Edward* (Sir F. Wigan and Sander and Sons).—A cross between C. Warszewiczii (female), and C. Schilleriana (male). A lovely flower with bright, deep rose-purplish segments, somewhat revolute, and with deep bright purple lip, well expanded in front, and with yellow throat. Award of Merit.

*Cypripedium Godfroyæ leucochilum*, *Hessle var.* (W. P. Burkenshaw, Esq.).—A richly marked and netted flower, the netting being dark purple, over a creamy ground. The substance is good. First Class Certificate.

*Iris orientalis var. Snow Queen* (Barr and Sons).—A most useful and decorative spotless white variety of this handsome species. Award of Merit.

*Iris variegata Sunshine* (G. Yeld, Esq.).—Certainly a most beautiful Iris, with canary-yellow standards curving inward, and paler falls. Award of Merit.

*Laelio-Cattleya Martinetti var. Prince Arthur* (Sander and Sons).—The long delicate sepals, one inch broad, are bronzy-tea coloured, the petals are brown and wavy, the long lip is folded over the column, but expands in front, and is very deep purple back in throat, the edges much lighter. Award of Merit.

*Laelio-Cattleya Aphrodite var. King Edward VII.* (Sander and Sons).—A superb variety of this noble hybrid with undulating segments, white faintly tinged with lilac, orange throat, and broad, open lip, bright deep purple, and fringed edge. (First Class Certificate.)

*Miltonia vexillaria gigantea* (Sir F. Wigan, Bart.).—A very deep and rich form, coloured rose-purple. First Class Certificate.

*Miltonia vexillaria, var. Queen Alexandra* (Sander and Sons).—The lip is greatly enlarged, being 3½ in broad, and as deep, with a deep indentation at the apex. The colour is pure white, with slight flush of mauve at the base of the petals, and the column is yellow. Award of Merit.

*Odontoglossum crispum, var. Princess Victoria* (Sander and Sons).—A charming spotted crispum of good form and character, the segments with fringed edges. The segments are flushed with deep mauve, and bear large and small crimson spots. Award of Merit.

*Odontoglossum crispum punctatissimum, var. Princess Maul* (Charlesworth and Co.).—A huge and magnificent variety of good form and shaded mauve; it is nicely spotted with deep mauve. The lip is large, with brown spots and yellow base. Award of Merit.

*Odontoglossum Harvenytense, var. Princess Margaret* (Sander and Sons).—The plant bore three flowers of fair form, the segment inclining inwards. The ground colour is pale tea, marked and blotched with brownish-red. Award of Merit.

*Odontoglossum crispum Her Majesty* (Sander and Sons).—A magnificently large and handsome white crispum, with one or two reddish-brown spots on each of the two lower segments. Award of Merit.

*Odontoglossum crispum, var. Imperatrix* (Sander and Sons).—Of good substance and fair form, the segments very distinct. They are white at the base and coloured purplish mauve, with white edges. A showy plant, carrying eight blooms. Award of Merit.

*Odontoglossum crispum, var. Princess Helene* (Sander and Sons).—The flowers are large, but apparently fragile. Largely coloured with brownish red over white. Award of Merit.

*Sparaxis Fire King* (Wallace and Co.).—A brilliantly showy variety with flowers nearly 2 in across, yellow radiated centre, blackish on the middle of the petals and crimson at the tips. Award of Merit.

*Sobralia x Wiganie* (Sir F. Wigan, Bart.).—The sepals and petals yellowish, and the lip pale purple. First Class Certificate.

*Rhododendron x Lady Clementine Walch* (John Waterer and Sons).—The colour is pink, with a suspicion of mauve and a pale peach-blossom centre with greenish and yellow blotches on the upper segment. The trusses are massive. Award of Merit.

*Zygosis Rolfceana* (Sander and Sons).—A hybrid between *Aganisia lepida* and *Zypopetalum Gautieri*. The lip is purplish-violet, the other segments the same colour at the base with green tips. The raceme carried three flowers and four buds. Award of Merit.

#### The President's Introduction.

The Very Reverend S. Reynolds Hole, Dean of Rochester, presided at the opening of the Rose Conference, and said that it was happy and opportune that the Royal Horticultural Society should honour the coronation of Queen Alexandra in the present manner. No one would dispute the Royal supremacy of the Rose. If you take the three great qualities of excellence in flowers—colour, form, and fragrance, there is no flower to compare with the Rose. Her Majesty is universal, from the humble cottage to the millionaire's manor. Queen Rose is grown to perfection by the hewers of wood and drawers of water quite as much as by the lord of the forest and lady of the lake. The Rose is suitable for the shrubbery, for walls, hedges, arbours, pillars, pergolas, beds, borders; for the decoration of the banquet, the bridal bouquet, and open bowls. And we can have Roses growing al fresco from May to December, abundant as they are beautiful. Many of our finest Roses had come to us from sunny France, and it was meet on this occasion for English growers to express their indebtedness to their French confrères for the many varieties obtained, led by La France, the queen of the garden Roses. But we have found out the art of raising beautiful varieties, and are not behind either in the forcing or culture of them. Forty-five years ago the Dean had inaugurated the first show of the National Rose Society, and it has stood well by exhibition Roses; but we now delight in Roses for the beautifying of our gardens—the decorative Roses, lovely varieties of the Chinese Rose. In conclusion, the Dean said: "As Chaplain-in-ordinary to the Queen of Flowers, I have said grace before meat; I have read the menu; may health and happiness wait upon both."

#### Mr. Baker on New Roses.

Following the chairman's remarks, Mr. J. G. Baker, late head of the Herbarium at Kew, delivered a few sentences on two species of Rosa from the S.W. of the United States that have recently come to notice. His full descriptions were written but not read, as was the case with most of the papers, but each and all will be fully printed in the Society's Journal. *Rosa stellata* was one of the new species, with a habit like the Scotch Rose, and similar prickles, but a marked characteristic is its three leaflets at the top of the stalks, like those of a *Potentilla*. It is found 5,000ft to 6,000ft above sea level. It is not yet in cultivation. The other species is *R. minutifolia*, from the coast region of South California. Mr. Baker surmised that our climate would be too warm and too damp for its successful growth. Coloured plates of the two were handed round.

#### Rev. J. H. Pemberton on H.T.'s.

Quoting from Mr. Geo. Paul's paper, entitled "Roses Since 1860," read at the National Rose Conference of 1889, Mr. Pemberton said that the period 1860 to 1889 had fairly been called the era of Hybrid Perpetuals and Teas, but that "the class of Hybrid Teas do not seem to have made real advance." During the last ten years, however, the H. Teas had increased 100 per cent. Formerly the Rose exhibition schedules were compiled almost entirely for the Hybrid Perpetuals, but the introduction of Her Majesty set rosarians a-thinking. In recent years there has been a steady increase in the number of this class of Rose shown and introduced, though many things contributed to keep it reduced. Thus no truly red variety was admissible among the H. Teas; and then the question had to be raised: What is a Hybrid Tea? The varieties themselves seem to differ so very materially, and it would seem that if introducers are not very sure to what their Roses belong at the moment of distributing them they daub them down as H.T.'s! H.T. Lord Salisbury differs considerably in general characters from Caroline Testout, and what prevents Gruss au Teplitz from being classed as a China?

After further discussing the great differences to be found among Roses of this section, and of the restrictions imposed in regard to them by the National Rose Society, Mr. Pemberton furnished a few cultural hints, in which he suggested very light pruning. "It is better," he said, "not to prune at all than to prune too hard." Certain varieties seem to have peculiarities of their own, and they do not all like the Briar stock. He had found that Mrs. W. J. Grant succeeded best on the Manetti, but personal observation of the varieties one grows is the only guide to the discovery of their likes and dislikes. Mr. Pemberton named the pioneer raisers of H.P.'s—the Dicksons, the Pauls, Bennett, Nabonnand—and referred to the characteristics of some of the finer varieties. He concluded by pleading for H.P.'s of bright red shades, and stigmatised many of the more recent gold medal Roses as "washed-out things."

#### More About Hybrid Teas.

The next essayist was Mr. Alex. Dickson, from Newtonards, whose success with the class, in company with his brother, is unparalleled. Mr. Dickson divided these into the following five classes, and discussed the merits of a number of the leading varieties in each. First, he took Beauty, Glory, and Modesty as representatives of his first group, the single Roses. Secondly, bedding Roses, with semi-double flowers, and named Marquis de

Salisbury and Killarney, which, if disbudded, forms a good exhibition Rose. Thirdly, free-flowering perfectly double varieties. First in this list was Mrs. W. J. Grant, which yields a mass of blooms early, and continues to do so till frosts appear. It is the first and, so far, only seedling from La France, receiving a gold medal in 1892. It was sold to an American firm, who sent out their stock under the name of Belle Siebrecht. Liberty is a new brilliant crimson Rose, which was raised in Ireland and sold to America. In March, 1900, it was distributed, and within one month the number of plants sold amounted to 100,000. Kaiserin Augusta Victoria was received from Germany, and welcomed on account of its colour. Marjory, a good white, was named after Mr. Dickson's own daughter, and was introduced in 1895. It comes splendid in the bud. Other three named were Caroline Testout, L'Innocence, and Countess of Caledon.

Fourthly, pillar and climbing H.T.'s. Here Cheshunt Hybrid was one of the finest, with Gruss au Teplitz (1899) and England's Glory. Mr. Dickson also named the following in his fifth class, good exhibition sorts presumably:—Mildred Grant, a gold medal Rose in 1900, and which possesses splendid form and colour. He believed that this must stand as the most prominent Rose raised in the last century. Duchess of Portland is also good; and so is Robert Scott, raised at the Pennsylvania Rose Nurseries, Philadelphia. Bessie Brown, sent out in 1899, had already reached the second place in the Rose analysis (see *Journal of Horticulture*, October 31, 1901), and it will no doubt oust Mrs. John Laing from the place this old variety has held for so long. The blooms are massive and altogether meritorious.

In concluding, the essayist said that few people had any knowledge of the hybridist's work. He would have liked to have been able, but he felt he could not lay down rules for hybridisation that could be depended on for set results. He had crossed and hybridised 50,000 Roses, yet not one hundred varieties had he sent out. He had studied the question of hybridisation and had failed to be able to reduce its principles to theory. There seemed to be no stability or dependableness on the results.

#### The Weather and Roses.

Mr. Edward Mawley, in reading a paper on "The Sensitiveness of Cultivated Roses to Changes of Weather," mentioned that, after annually for the last twenty-five years contributing a résumé of the weather report to the National Rose Society, instancing the effect of the same on various species and varieties, the conclusion he had arrived at was that there is no more sensitive plant than the Rose to changes in temperature, rainfalls, &c., which come under the one head of weather. Many—perhaps the great majority—of our cultivated varieties are only what may be termed half-hardy, and for an example of a hardy one, Bennett's Seedling still enjoys a reputation among the best. It is a marvel that the English climate, which really only satisfactorily supplies one of the conditions most necessary to the successful growth of the Rose—i.e., a humid atmosphere—suits this subject so well. Moderate cold, experience teaches, is good, but in severe winters often much harm is wrought. Great mildness is also undesirable, because when such exists the plant is deprived of that rest which it needs to defend it against late frosts. A beneficial practice is to draw the soil in autumn well up and around the plant, thus protecting it in a measure from this evil. The greatest trials the rosarian has to endure are, after passing successfully through a severe winter, a late frost or severe drought when buds are in progress mars what would otherwise be at least a satisfactory result of months, and perhaps years in some cases, of earnest work.

#### Roses under Glass.

Mr. George Mount, of Canterbury, read a most interesting and instructive paper on "Roses Cultivated under Glass." For February blossoms, Mr. Mount advised pots to be used, which, after flowering, can be placed outside, thus enabling the house to be used for other purposes. Also, in this method of culture, more command is held over the plants. Eight-inch pots are used, and October is the time for the potting to take place, and the plants well potted to where budded. Protection from bad weather, and syringing if bearing much foliage, are two necessary items in a successful start. In the November twelvemonth pruning and top-dressing must be attended to, and hard pruning is beneficial, after which only sufficient fire heat to protect should be used. When leaves appear no syringing should take place, as this is not needed to keep clean; fumigate at first trace of fly. When the buds appear, feed, and aim at growing the plants strong enough to need no staking. After blooming, encouragement should be given to make good growth, and they may then be turned out into cold frames. When the method of planting out in borders in houses is adopted, a house 20ft wide, with two paths, giving 2ft 4in borders and one central 8ft bed is the form to employ. The houses should be kept close to allow buds to break well, and Teas or Hybrid Teas may be used. As an instance of better growth on secondary wood Catherine Mermet was cited.

The conference concluded with a hearty vote of thanks to Dean Hole. No further papers were read on the second day.

## Improvements in Hardy Plants.\*

It is now nearly forty years since I first interested myself in hardy plants. It was at the period of the "flare-up style" of gardening, masses of brilliant colour for about three months, and the remaining nine almost bare. Many collections in nurseries were destroyed, and I have had to run through these doomed plants, buy up what I wanted at a nominal price, and see these same collections reinstated within ten years from the time they were destroyed.

The only collections of repute in those days were those of Rollisson of Tooting, the St. John Wood's Nursery; Yule of Yarmouth, and May of Bedale. These collections were limited in extent, but unlimited in price. *Digitalis purpurea* was priced at a shilling a plant; *Gentiana affinis* at the same figure. One had taken five minutes and the other five years to make. These were the sort of inducements offered to the public for buying hardy plants. They were practically ignored by everyone, and the trade always looked upon them as a great nuisance, costing far more than they were worth. To show how much they were appreciated, I will just give you my first experience at the old Horticultural Gardens at South Kensington. It was suggested that a group of some of the wonderful plants that were being collected together at Tottenham should be exhibited at one of the big summer shows. I believe this was the first time that anything like a representative collection of hardy stuff had been shown.

A lot of preparation had been made, space had been written for, and on the appointed day a van with plenty of assistance appeared at the great horticultural exhibition. I saw the superintendent, Mr. Eyles, shortly after my arrival, and asked him for a space. He told me I should have to wait and see if any were left. I did not like my reception a bit. After waiting and worrying till about eight or nine o'clock, he told me he would come and see what I had got. "Go and wait in the yard till I come," and I was foolish enough to go. After again waiting some considerable time I went and found him, and got him to go and have a look at the class of plants I proposed to exhibit. He looked at them in the van, laughed, and said; "I cannot have such rubbish here." However, after waiting another hour or so, a man was sent to me stating they had got a place for me in the western arcade among the exhibits of wire stands, pottery, and other accessories to the garden. I was given two large wire stands to set up pots, pans, and boxes, and did the best under the circumstances. Now every show in the country largely depends upon hardy plants to fill the tents.

It is impossible in a short time to go fully into such an important subject as the improvement of hardy plants, the capabilities of which are immense, but it is of vital importance that this matter should be taken up to assist in maintaining an interest in hardy plants. It is becoming more difficult every year to find novelties, and it is new or rare plants that the public want. It is surprising how little has been done in this direction. Some families, it is true, have been thoroughly dealt with, and these now form some of the chief attractions to the gardens of the present day, but how few have received the attention they deserve!

It is unfortunate that nurserymen as a rule have so little time to devote to this important matter. The older they get the more they have to do, and before they have accomplished one tithe the part of their early intentions they find their energies directed to other phases of horticulture. What a vast field there is still for enterprising men to take up hardy plants and improve them by hybridising and selection! What an opportunity many of our gardeners have for this kind of interesting work! They have the materials and opportunities, and in hundreds of cases nothing would please their employers more than to know that their gardens were the birthplace of numbers of plants which sooner or later would find their way into every garden in the land. There is also a vast field open for men fond of mountaineering; but this class of enthusiast is difficult to find, because a young man has not the knowledge to detect a new plant the moment he sees it, while the middle-aged man, having the knowledge, has not always the energy necessary to take a trip of two or three days' duration in the mountains, carrying all the paraphernalia required for climbing, and knowing there is no luxurious hotel in which he can recuperate for the return journey.

In one of my trips to the Pyrenees, in 1870, I was successful in finding many interesting plants, some of which are now common, while other have, unfortunately, been lost—*Ramondia pyrenaica alba*, *Primula integrifolia alba*, *Gentiana verna alba*, and a solitary double-flowering variety, which never survived the journey, *Anthericum Liliastrum major*—not the major now offered, but one growing 3½ft with very large flowers

\* Improvements in Hardy Plants, a paper read by Mr. Amos Perry, of Winchmore Hill, London, N., before the Horticultural Club.

—and many others. I am afraid we must fall back upon the amateur for the raising of seedlings, selection, hybridising, &c., and if we can only induce more enterprising amateurs to take up this matter no one knows what may be accomplished. Secretaries might greatly assist in the work by offering prizes for any improved variety of hardy perennial, and honouring them according to their merits.

We want more reverend gentlemen like the late Mr. Nelson, Mr. Ewbank, and Mr. Harpur-Crewe, who did valuable work in their time; the Rev. C. Wolley Dod, Sir Michael Foster, who has done so much for the Iris; Mr. James Salter, the developer of the Pyrethrum, and many others. Some families have received a fair share of attention, and to the French florists we are principally indebted for the great improvement in the Phlox, which is still capable of further additions. Many of them are too tall, and the Americans have just started a new race only growing 1ft in height, which for many purposes will be invaluable. The alpine Phloxes were taken in hand by the

Messrs. Kelway and Son, but although the results cannot be considered great, yet it is possible that from these may be obtained other varieties of greater merit. The idea seems to prevail that a Delphinium should be blue, and if you admit a white or a yellow into your collection it must be a good one. It is, however, a great achievement to get a break of this description, and now we have white I see no reason why yellows, scarlets, and every other intermediate shade cannot be produced.

The Oriental Poppies deserve mention as being one of the few recent families that has received special attention, and among them are many of great merit and still capable of great improvement. I see no reason why we cannot obtain as much variety, colour, and form as in the annual varieties. In Fringed Beauty we have the first break in form. The flower has a deep fringed edge to the petals, while in Mrs. Marsh we have the first two coloured varieties, and with this material to work from no one can form any conception of what may be obtained. [It may be here noted that at the recent Temple Show Mr.

The East Front of Holland House.

Rev. John Nelson, and to him we are indebted for one or two of the best at present in cultivation.

The Hollyhock is essentially an English flower, and Mr. Chater's name will always be associated with it, but I do not think there is much room for further improvement in that direction. We want a change, and I think the material is at hand in *Althæa fecifolia* for producing an entirely new race of Hollyhocks, dwarfer in growth, of pretty branching habit, and of far more value for many purposes than the present group.

Carnations and Pinks now occupy a prominent place in our gardens, but what a change from the old school of florists, of which the late Mr. Turner was the chief. A Carnation with a fringed edge, in those days, was considered a monstrosity, no matter how free blooming or beautiful in colour, and now we hear of fringed Carnations realising thousands of dollars. In connection with the Carnation we must not forget Mr. Martin Smith, who has done more for this flower than any man living—and an amateur. Long may he continue his work with this family, and set an example to others to try and do likewise with some other race.

Delphiniums have received a fair share of attention, both by English and French raisers, and many splendid varieties have been the result. A remarkable break has been obtained by

W. J. Godfrey staged and received awards for some handsome novelties.—ED.]

The Tritoma has received a good deal of attention, but the work is only half done. T. MacOwani should be taken seriously in hand to endeavour to form a new race of dwarf varieties for summer flowering and adapted for massing as well as for pots. Lobelias, Pentstemons, Dahlias, Chrysanthemums, and others we know all about, but they hardly belong to the class of plant under consideration this evening.

(To be concluded.)

#### Windsor's New Gardens.

The new riverside gardens at Windsor were informally opened on Thursday. By permission of the Queen they are called Alexandra Gardens, and a member of the Royal Family is to perform the official opening ceremony in the course of the next few weeks. £14,000 has been spent on improving the river side, and the gardens have been most prettily laid out.

## NOTES

## &amp; NOTICES

**Royal Horticultural Society.**

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, July 8, in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. A lecture on "Ornamental Trees and Shrubs" will be given by the Rt. Hon. the Earl of Annesley.

**Raid on Mushroomers.**

A vigorous campaign against Mushroom gatherers is being carried on in Yorkshire. Besides ordering the payment of costs and damages, the Lowden magistrates have imposed fines ranging from 5s. to 10s. on each offender. The damage done to growing crops is said to have been considerable, and Mushroom gathering to have become an intolerable nuisance.

**Alpine School of Gardening.**

The popularity of the carefully tended Alpine Garden (says the "Daily Mail") is not limited to the British Isles. On the Schneeberg Mountain, in the Styrian Alps, a school garden has been established as a sort of educational medium for school children and the public, who are expected to study the botany of the indigenous plants.

**The Age of Trees.**

The estimation of the age of trees by means of the number of rings visible in the wood is well known to be subject to many exceptions. By pinching, or pruning, or grafting, a second layer of wood may be formed in one year in a shoot. The explanation is that the pinching or other operation brings about a state of rest, and less sap is directed to the wound. But when the adjacent buds begin to grow, the afflux of sap is increased, and a fresh zone of wood is the result.

**Cheap Strawberries.**

The fine weather has greatly improved the prospects of the Strawberry crops. On Saturday at Covent Garden about 70,000lb of Strawberries were received from Southampton alone. In Cheshire and Denbighshire the yield is anticipated to be the heaviest of recent years. A Covent Garden dealer on Saturday said that the long spell of wet had not done the Strawberries any harm; it had only kept the fruit from ripening. The fruit would be cheap again when the full supplies began to arrive.

**Chelsea Physic Garden.**

Except the Botanical Garden at Oxford, whose Linnæan beds were destroyed by the zeal of some reforming Philistine, the Physic Garden at Chelsea is the oldest botanical garden in England. It has chosen the present month to inaugurate its work of larger usefulness as a garden with laboratories of the best kind for the use and instruction of botanical students. Unhappily, the current year has witnessed a loss to the garden which cannot be replaced. Its Cedar tree, the oldest Cedar in England, is dead. The famous Gingko tree is alive, but has been shut out of the garden by the "improvements." But trees are not being treated very well in London this year.

**Royal Scottish Arboricultural Society.**

A general meeting of the Royal Scottish Arboricultural Society is to be held at Edinburgh on July 18 next, under the presidency of the Earl of Mansfield. A considerable amount of business of a varied and interesting character has been placed on the agenda. Special attention is directed to the forestry section of the Highland and Agricultural Society's Show at Aberdeen on July 15 to 18. The show will include a forestry section organised by the Royal Scottish Arboricultural Society, similar to that held at Inverness last year. The hope is expressed that a large number of members will attend the show. An informal meeting of members is to be held in the directors' room in the showyard on Thursday, July 17, at twelve noon, when a discussion will take place on the exhibits, and the best means for improving the section. The local secretaries are Mr. James Wilson, B.Sc., Department of Agriculture, Marischal College, and Mr. John Clark, forester, Haddo House, Aberdeen. The paper also contains an intimation of the annual excursion, which is to be a tour in Sweden.

**Strawberries in Plenty.**

The glorious weather has so improved the prospects of the crop of Strawberries in Cheshire and Denbighshire, that the heaviest yield of recent years is anticipated.

**Nine-leaved Shamrock.**

Finding a nine-leaved "Shamrock," a farm labourer at Groningen, Holland, sent it to Queen Wilhelmina, who accepted the gift and rewarded the donor with £2 1s. 8d.

**Cold Storage Steamers.**

A new line of refrigerator ships, owned by a British-American syndicate, is to be established, with direct service from New Orleans, New York, and Boston, to Bristol, England. The New Orleans line is to carry California fruits.

**World-famed Trees in Peril.**

A great forest fire is raging in the Tuolumne Mountains in California. The famous Tuolumne Grove, which contains some of the largest trees in the world, is threatened with destruction. A number of soldiers and civilians are fighting the fire, but it is doubtful whether they will be able to save more than a portion of the Grove.

**Commemoration Oaks.**

Some of the Colonies will not be without English Commemoration Oaks this year. Last November an Eton tradesman sent a bag of acorns, picked up in Windsor Great Park, to Australia. He has just received a letter from Melbourne in which the writer says: "The little Oaks are doing well. They have several leaves on them now."

**Covent Garden Indignant.**

Many of the retail dealers at Covent Garden are loud in their expressions of indignation at the publicity which the "slump" prices in Covent Garden have gained, as they say it has been spoiling their market. But the wholesalers have little sympathy with the retailers, for they say that in a crisis like that of last week the retailers do nothing to help them out of it, but by keeping up their prices make it all the worse.

**Hull Fruit Trade.**

The Hull fruit trade has suddenly and considerably improved this week, and the merchants are looking forward to a busy season. The improved train service from Paris to Boulogne will make a great difference to Hull traders, inasmuch as delays, sometimes extending to half a day, will be avoided. Fruit is now carried across France in special ventilated trucks, and shipowners are making provision to preserve its freshness in transit over sea. The Goole steamer Mopsa, for instance, which has begun its regular sailings to Boulogne, is provided with a novel apparatus which keeps its deck cargo in a current of cold air. This experiment has awakened a good deal of interest, and it is likely to be extended.

**The Blue Rose.**

A story has gone abroad again regarding an impossible blue Rose. The facts of the case are that a Mr. Donald, a Scottish gardener, who has been for seventeen years in the United States of America, recently brought over a sturdy plant (a Wichuriana-Rambler cross), hoping to have it in flower for the Rose Conference held last week at Kensington. On board ship he may have jocularly remarked that the novelty was "a blue Rose," and a journalist being at hand, gave the story wings. The plant was safely housed in the stove at Chiswick, having been cared for in a special Wardian case during its voyage, but even with the warmth of the hothouse, the buds were not expanded sufficiently to show the floral characters. The N.R.S. folks may see this new American visitor.

**Our Fruit Imports.**

The following little table shows the quantities of certain fruits imported into the United Kingdom in the week ended June 21, 1902, together with the quantities in the corresponding week of the previous year:—

| Fruit, Raw.          |            | 1901   | 1902   |
|----------------------|------------|--------|--------|
| Apples               | cwt...     | 1,053  | 216    |
| Apricots and Peaches | cwt...     | 615    | 330    |
| Bananas              | bunches... | 31,803 | 48,162 |
| Cherries             | cwt...     | 45,427 | 12,220 |
| Currants             | cwt...     | 185    | 500    |
| Gooseberries         | cwt...     | 5,302  | 4,833  |
| Grapes               | cwt...     | 185    | 267    |
| Lemons               | cwt...     | 42,749 | 13,688 |
| Oranges              | cwt...     | 23,121 | 71,507 |
| Pears                | cwt...     | 961    | 50     |
| Plums                | cwt...     | —      | 50     |
| Strawberries         | cwt...     | 8,014  | 7,111  |
| Unenumerated         | cwt...     | 2,247  | 8.3    |

### The Story of the Blue Rose.

Apropos of the blue Rose (a correspondent writes), my little girl, to whom I read the item, proceeded to tell me the following pretty legend: "There was a man who lived in Antwerp. His name was Quintin, and he was very poor, but he was very clever and nice. He was in love with a very dear girl named Elsa, who was the daughter of a very rich man who was the mayor (only they called him some other name). The mayor was very angry with them, and when Quintin went to see him and said he was going to give up being a blacksmith, and become a great painter and be very rich, the mayor only laughed. He said, 'When you can paint blue Roses and red Lilies from life, then you can marry Elsa; but not till then.' So poor Quintin went away very unhappy, because he knew there were no blue Roses or red Lilies."

### Profitable Apples of Upright Growth.

I am much obliged to "H. D." for his answer to my inquiry. It is highly satisfactory to learn that Lord Derby is, as I hoped from the appearance of my young bushes, of upright habit as a standard, because, of all the culinary varieties I am trying, I place it first for my land. I also much like the appearance of Lord Grosvenor, and should be glad to know if it is of upright habit as a standard; the same as to Bramley's Seedling. Warner's King will suit me well for one variety. I am sorry to have to omit Cox's Orange among dessert varieties, and doubt whether Allington Pippin will be in demand as a market variety. Am I right in concluding that Duchess of Oldenburg and Potts's Seedling are both upright? Is Beauty of Bath?—BEGINNER.

### The Crooked Spade.

Apropos of Mr. W. R. Raillem's notes on "The Cornish Spade" (page 533, last volume), the following from an old descriptive book relating to Scotland, mention a crooked spade as being used in Skye. "Two miles further on," says the itinerary, "is Monkstadt House, the residence of Hugh MacDonald, Esq., one of the most extensive farmers in Skye. The fertile valley extending to the north of the house is the bed of a lake which has recently been drained, the ground thus acquired being cultivated with the crooked spade peculiar to the agriculture of Skye." The reasons given for the employment of these long-handled and peculiarly shaped spades are that both the Cornishmen and the Scottish Highlanders at a recent period used to work barefooted and could not tread the spade in the usual manner.—J. H. D.

### Standard Outdoor Peaches and Nectarines.

On the inspection of an article that appeared in your columns some time ago, describing the success of Mr. Turner, of Slough, and, I think, Messrs. Veitch, in growing Peaches and Nectarines as standards out of doors, I planted six Peaches and five Nectarines in the autumn of 1900. They grew well, and, last summer, ripened a good lot of young wood. This year they were covered with very fine and fully expanded blossom, which stayed on the trees a long time. In this southern district we had no more than 3deg of frost (3ft from the ground) on any night after the blossom was out, and then the trees were well covered with tiffany. Yet not a single fruit has set. What can be the reason? Could it be the high and cold winds? I am on a hill, and get a great deal of wind from the south-west. A bank protects the trees from the north-east, but not from the east. We have hives of bees in the garden; but the bees were busy on the few sunny days on Gooseberries, Currants, Wall-flowers—anything but the Peaches and Nectarines. Therefore I tried inoculation with a camel-hair brush, when the sun shone; but hardly any pollen showed on the brush at any time, and often I could not see any at all. The trees suffered very badly from leaf blister; but this, I imagine, did not prevent the fruit from setting. They are six to eight feet high, and well furnished with branches. The soil is somewhat heavy, but not wet, as it is on a steep slope, and a drain runs nearly parallel to the row of trees, and only a rod from them. The result is most disappointing. Can I do anything to insure success with the trees?—SOUTH SUSSEX.

### Grape Gros Maroc.

Under the above heading, and ever the initials "R. M.," a question appeared in your pages about a year ago as to whether this variety was worth growing, as it had failed to give satisfactory results here, Marlay, Rathfarnham. To my inquiry several of your correspondents very kindly replied giving advice as to the proper treatment which it should receive, and having carried out their advice, it is with much pleasure I tell it that the Vines of this variety in most cases had a surplus of bunches this season. Some of them are carrying a heavy crop.—R. M.

### The Bothy.

A good deal has of late appeared regarding the above subject in your pages, one writer being in favour of doing away with it. I think if a poll were taken as regards the wishes of young gardeners of to-day that a great majority would be in favour of the bothy. One question which has a great deal to do with this subject is the position which those of us who are head gardeners take in reference to it. Are we doing our duty? Do we know that the bothy is not as it should be, and are we taking no steps to remedy it? We are, as a rule, most anxious as to the characters of the young men whom we engage to live in such places, and if they be unfit for habitation, and if we have made no efforts to get them put right, surely the blame rests upon us. It may be that some employers may object to incurring any expense, yet if we have right on our side, let us take courage and go forward again—in the end right will prevail. One failing, which I trust is not a general one, is that many of our young men do not apply themselves to reading as they should. This is one of the many ways in which a good example is likely to bear fruit in time. If the books be few let them be good. It is with feelings of deep gratitude to my present employers that I have been enabled to do a little to brighten the lot of the young men here. It would answer no good purpose to recall the state of things as they appeared to me when taking over charge of these gardens.—ROBERT RUSSELL, Co. Dublin.

### The Wages of Gardeners.

A correspondent to the "Florists' Exchange" writes:—  
"Some time ago in reading the interesting and instructive articles from the able pen of Joseph Meehan, I noticed a few words in regard to the wages of gardeners in comparison with those paid in other trades and professions. I was pleased to see the subject taken up by one of such experience and reputation, and have been expecting someone else to give their views on the matter."

"Does the profession of horticulture require less brains, study, and hard work than other trades and professions? One who intends to become a successful horticulturist will find that it takes ceaseless study, a close and strict attention to business, plenty of hard work, combined with the bump of patience well developed. We have longer hours requiring more watchfulness and care than most trades. Why, then, should not a gardener get wages that would compare with the wages of skilled help in other trades? How often do we see in the trade papers ads. worded thus: 'Wanted, young man with experience in growing Roses, Carnations, Chrysanthemums, Violets, &c., sober and honest, not afraid of work; wages 25 dols. per month and board,' which is just a little more than some men pay labourers that work nine and ten hours per day; and the gardener will be working as long as there is daylight (if he is foolish enough to do so), with a room in the potting shed, or a cot minus the room."

"A great number of our prominent and successful growers pay fair wages, and one can soon detect the difference between their establishments and the place that has insufficient and poorly paid help. One is all bustle and everyone doing his utmost to raise the best stock possible; everything is clean and neat. The other is dirty and untidy, stock poor, the help loafing and more interested in somebody's best girl, or a prize fight, or something more exciting than their occupation."

"I think it would be a benefit, both to employers and employes, who have the best interest of the profession at heart, to form some kind of protective association, and only admit to it applicants having good references, so as to protect both those looking for good help and men looking for good situations. Men looking for positions have to furnish good references, and then often find, especially if seeking a position at a distance, that the place has been mis-represented, the employe often having a hard time to get his wages when due. Surely some way should be devised to guard against such cases. I hope to hear others' views on this subject; and that someone will think of a plan to benefit all.—ARTHUR TAYLOR."

### New Roses.

The most striking fact in regard to novelties in Roses is that we now look to home raisers for improvements. A few years back it was the custom of a considerable number of Continental growers to send over rather lengthy lists of new Roses, which on trial did not, in the great majority of cases, include over many kinds which proved satisfactory. Of course, one must not forget what such raisers of France as Lacharme and Guillot have given us, and our exhibitions and gardens would miss such beauties as Charles Lefebvre, Catherine Mermet, and La France; yet it can hardly be said that our clever neighbours have produced more than one superlatively beautiful Rose (Maman Cochet) during the past decade.

Within that period what strides have been made! Indeed, it is not too much to state that Rose-growing has been revolutionised with the introduction of such large, shapely, and giant-petalled sorts as Mrs. W. J. Grant, Bessie Brown, and Mildred Grant. One has only to carefully scan the stands of our leading exhibitors to conclude that their resources are even not yet exhausted. Last season we noted from

#### B. R. Cant & Sons

*Ben Cant*, a new flower of splendid qualities. It belongs to the Hybrid Perpetual class, and to us appears the most valuable addition to dark-coloured Roses that has been obtained for some years. The colour is a rich, deep, velvety crimson, not unlike the shade found in Victor Hugo. Its petals are big, thick, and lasting, and the shape of the flower most elegant, showing the inner surface to perfection. The growth of the plant is stout and vigorous, an improvement on the above-named variety it mostly resembles. This Rose should be esteemed by exhibitors who have to complain of a want of really first-class dark show Roses, and it is one that will help to recall the memory of a champion Rose grower for many years to come.

*Mrs. B. R. Cant*.—This is not so much a Rose for show as it is a sort that will please everyone; free blooming as well as continuous, nice colour, and charming shape. It is hardy and sweet-scented. The shade is a deep rose, and in autumn quite a red tint is put on. The form is globular and attractive, both of flower and foliage. Vigorous and branching to a degree, it is just the Rose to plant in masses to cut and come again.

#### Frank Cant & Co.

*Lady Roberts*.—This firm is fortunate in producing such a charming kind. It is a variety of exquisite shades of colour. Buff with lively tints of red would describe it, but not perfectly, because it is impossible to take in the varying hues in a few words. Petals large, shape deep and pointed to the centre, it is a form which most appeals to Rose lovers. To those who know that lovely tea-scented kind, Anna Olivier, at its best, it may be termed a deeper coloured type. It certainly seems to be a sport from this Rose, or, at any rate, if a seedling (as I am told it is), the general characters of the parent are retained in a greater degree than mostly found in Rose progeny. However, Lady Roberts is a strikingly fine new Rose; one that should be added to the choicest collections, for it will help to win prizes for as well as give pleasure to the grower.

#### Alex. Dickson & Sons.

These eminent growers are responsible, as usual, for some choice new things. They appear to monopolise that grand race of Roses, the Hybrid Teas, so rich in qualities as handsome blooms, free and continuous in flowering, and markedly beautiful foliage. The class is as yet comparatively young, and the colours range principally in shades of pink, blush, white, or rose. Perhaps in the near future these successful hybridists will produce varieties with rich red and maroon shades. Fancy Roses with the petals or "wings" of Mrs. W. J. Grant and Mildred Grant, bearing the colours of, say, Captain Hayward and Xavier Olibo!

*Duchess of Portland*.—This is a lovely bloom, of a sulphur yellow shade, large, full, and of perfectly symmetrical form, with grand petals of a thick, smooth texture. The habit of growth makes it desirable as a garden Rose, and a constant kind for pot-culture or exhibition.

*Lady Moyra Beauchere* is, like the last-named, a Hybrid Tea, and the flower has great beauty. Its colour is a bright shade of rose with silvery reflex, the form circular with high-pointed centre. It is large, full, and massive looking. Growth vigorous and branching, and a sort that we should imagine will make a good pot Rose.

*Mildred Grant*.—The Rose is admittedly the Queen of Flowers, and this variety is to my mind the Queen of Roses, as no kind

yet seen, in public at least, is so majestic of look. In size and thickness of petal it is without an equal, and in size too; in form not surpassed by any. If I were asked to find some fault with it I would say the colour is just a bit wanting. A green tint we sometimes see in light-coloured Roses, notably in The Bride and sometimes in the outer petals of Kaiserin Augusta Victoria, is noticeable in this Rose; still, it is magnificent. Colour, white, with a pale rosy tinge. Its wonderful petals on the outer part of the bloom fall back, and the inner ones fold to a perfect high-pointed centre, making it an exhibition Rose of the first order. Seen growing, the foliage is distinct and the stem stout, the blooms requiring no support.

#### Paul & Son.

The attention of this firm, which has introduced many fine kinds of Roses, seems recently to be centred in the production of charming single and other types of decorative, rather than strictly show Roses. *Psyche*, a rambling Rose, and *Una*, a single-flowering variety of recent raising, are two types which have fine qualities to recommend them.

*Purple East* is distinct in colouring—carmine with purple shade—and produces in abundance semi-double blooms about 3in across.

*The Lion*.—This is a single Rose, bearing striking blossoms of a rich crimson shade. The vigorous habit of the plant makes it desirable for garden decoration.

*The Wallflower*.—The attractive shade of crimson in this new Rose is much admired. It is esteemed, too, as a wall Rose, or a variety to cover space quickly on account of an exceptionally vigorous habit. Those who like the well-known Crimson Rambler (and who does not?) will welcome the newer kind.

*Lady Battersea*.—A Rose which partakes of the China class because of its exceeding freedom in flowering. The colour is a bright cherry-red. In form the flowers are long and pointed, although not over-large. Vigorous and branching in habit, it will make a capital Rose for pot culture, as well as being one of the choicest introductions for bedding or planting in a mass.

#### Wm. Paul & Son.

The Waltham Cross growers have either raised or brought into cultivation a great number of esteemed Roses. Their more recent novelties run more on the lines of attractive garden Roses rather than exhibition sorts. One exception, however, is *Boadicea*. This is a tea-scented variety of some merit. Besides its exquisite colouring—shades of peach and violet—it has excellent form; quite a style that will be welcomed by exhibitors, and as it has size also one may with confidence recommend it.

*Empress Alexandra of Russia*.—Salmon with bronzy shades of red would describe the tints of the colouring of this distinct and attractive Rose. Sometimes the blooms come large enough for show, but are not lasting. It is one, however, that invariably creates a liking when first seen, and is a charming garden kind.

*Morning Glow* is a big-petalled flower with very distinct colouring. Fawn and red in varying shades predominate.

*The Alexandra*.—This again is most attractive in its combination of hues—deep yellow and bronze. *Salmonea* is yet another distinct and pleasing Rose for garden decoration. The colours are red and salmon, this last shade appearing in the centre of the flower.

#### Robt. Scott & Son.

*Robert Scott* is an American novelty—a Hybrid Tea not unlike Mrs. W. J. Grant with light shades. Flesh-coloured pink is the colour, and the bloom large, full, and quite up to exhibition standard.

#### J. Wood.

*England's Glory*.—This Rose was raised in our neighbourhood (Woking), and introduced this spring. It is the result of a cross between Gloire de Dijon and Mrs. W. J. Grant, having the colour, or rather lighter shade of the latter with an improved form of the former. Those who know Grace Darling may form an idea of the new-comer. It is, however, of better shape, stronger in growth, and very free flowering. It will become a valuable Rose for forcing under glass. The shape is always good, either in small buds or open blooms. Pity it is that this novelty has not been exhibited, but Mr. Wood, who had something to do with such Roses as Mrs. John Laing and Her Majesty before the Rose public saw them, should know what a good flower is.

#### Treseder

Mrs. Stephen Treseder is an exact counterpart of that fine Tea Rose Anna Olivier, only lighter in colour. Lady Roberts (the darker) and Mrs. Treseder (the lighter) are two valuable additions to this charming type. Free and of good growth in the garden and first-rate for exhibition, they make excellent pot sorts, and are well adapted for forcing into early bloom.

#### J. Veitch & Sons, Ltd.

*Queen Alexandra*.—This free-flowering Rose rivals the Crimson Rambler in its rampant growth and huge clusters of miniature flowers. The colour is a bright shade of pink, most distinct and pleasing. It was much admired at the Temple Rose Show last year, and will doubtless be seen in many decorations of Roses this season.—H. S.

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### Floral Designs.

Frequently the most simple selections of colour and arrangement of forms in flowers and plants, produce an exceptionally beautiful result. Such was at once apparent in the case of a floral cross seen in Gerards, of Regent Street, London, last week, where the only flowers employed were bright purple *Violas* with a yellow eye, without any greenery whatever, and only a relieving bunch of *Caladium argyrites*' leaves. The flowers were

and ought to be), and consisted of *Lilium longiflorum*, wired, with sprays of *Odontoglossum crispum* and long, graceful fronds of *Nephrolepis* shooting out beyond all. Supporting the bouquet I noticed handsome and typical leaves of *Ficus elastica variegata*, whose colour harmonised with that of the yellow-spotted *Aucuba*.

A second wreath consisted of white Pinks on the frame, with no fringe of greenery. This is a point worth noticing. None of the wreaths have any fringe whatever, and they are not generally one-sided articles—for the flowers form a complete covering on all parts of the frame. A finished wreath then is like a life-belt, only that it is not flat-sided. In this wreath the bouquet attached to it was composed first of *Stephanotis* flowers, each separately wired, some made to protrude outwardly from the

Holland House from the West.

all wired, the stalks being inserted among the moss binding of the framework. Thus their faces were flat and turned outward to the gaze of the many admiring pedestrians. The whole surface of the frame was covered with rows of the *Violas* all evenly woven in. The wired *argyrites* leaves were bunched at the intersecting point of the cross-piece, and each was held out over the *Violas*. In height the cross may have been 3½ ft and 1½ ft broad.

Another beautiful feature, in the same window was a large wreath, the frame being hidden by finely spotted *Aucuba* leaves most effectively arranged. The edges of the leaves had been folded inwardly, and were thus fluted. Each had then been evenly disposed against its neighbour, and formed a circle of unerring exactness, the fluted leaves following and fitting one another like the scales of a fish. The bunch of flowers placed on the wreath in this case was loosely composed (as they always are

centre of the bouquet, others kept back. Then at the lower half of the arrangement were beautiful sprays of *Lily of the Valley*, and above all, though so ably disposed that their size did not detract as they would have done by clumsy manipulation, were flowers of *Lilium speciosum album*.

Lastly, there was a basket formed of plaited straw and thin bamboos, and coloured light "sharnie-green." The sides were not deep; they were straight, and the bottom flat. The prevailing colour was yellow in the arrangement. Thus yellow *Richardias* were used along with yellow English *Irises*, yellow-leaved *Crotons*, and a great and loosely set bunch of William Allan Richardson *Roses* at the right-hand front corner. Towering up at the back, and giving balance to the whole, was *Hydrangea paniculata*, dense in structure, and beautifully white. A huge bow of golden-orange coloured satin ribbon, half a foot in breadth, was fastened by some means toward the centre of the

flowers and plants inside the basket, and another similar bow was effectively attached near the left-hand bottom corner, outside the basket. These London florists of first rank always bring broad ribbon bows to their aid; and the colour of the bows always harmonises as closely as possible to that of the flowers.

#### Displays at Regent's Park.

In their endeavours to stimulate attention to their gardens, the council of the Royal Botanic Society of London have secured the presence at Regent's Park of Messrs. Barr and Sons, who are exhibiting hardy cut flowers and Japanese pigmy trees in the corridor of the Society's garden, and Messrs. John Waterer and Son, Limited, of the American Nurseries, Bagshot, are now holding their annual and much admired display of Rhododendrons under canvas in the open ground. Both displays are interesting, though naturally the splendour of the Rhododendrons eclipsed the brilliance of the humbler border flowers. Taking Messrs. Barr's display first, one cannot omit at least to mention the Japanese pigmy trees which for three years now have engaged such considerable attention by the ladies of London society. And the latest lay newspaper reports tell how the craze has extended to Paris, which is surely a reversion of the proper order of events, the Gay Capital usually being the forerunner in matters fashionable. Frequently the *Journal of Horticulture* has printed paragraphs detailing the price of Japanese pigmy trees as sold at auction—prices which range from two guineas up to twenty-two guineas and beyond. Larches, Pines, Junipers, Cupressus, Japanese Maples, and other genera are mostly the kinds on view, and all of them are in fancy vases or pans. Messrs. Barr's collection of hardy flowers was rich in Bearded and Spanish Irises, amongst the former being varieties of *I. squalens*, *I. pallida*, and *I. variegata*. Thus if those who have not the privilege to visit a good Iris collection, and they will rely on our judgment, the following would be our commended selection: *I. pallida* Leonidas, with lavender falls and purplish standards; *I. p. rubella*, purplish-violet; *I. neglecta* Hannibal, blue; *I. variegata* Louis Meyer, dark violet falls, yellow standards; *Iris germanica* Mrs. G. Darwin, a beautiful ivory-white with satiny-sheen; *I. variegata* Gracchus, violet falls, rich yellow standards; *I. neglecta* amabilis, lavender-violet standards and purplish falls; *I. delicata*, lavender; together with *squalens* Dr. Bernice and *variegata* Hector, both of them richly coloured.

Amongst the Spanish Irises the variety Thunderbolt stood out most prominently, the others being less known to us. The great scarlet flowers of the Oriental Poppy were much in evidence, and the noble Delphiniums, in colours blue, purple, and violet, were most magnificent.

Iceland Poppies are now in season, and these formed no small part of the exhibit. And the delicate beauty of the Lady's Slipper Orchid—*Cypripedium calceolus*—and the still finer *C. spectabile* or Mocassin Flower, obtained much admiration. These are charming subjects for the bog garden. *Lilium giganteum*, noblest of its race, was shown in huge pots, but is not in flower. *Ixias* in a great variety of uncommonly lovely tints were also included, and I can only repeat the recommendations formerly given, to the effect that these bulbous plants succeed admirably on open, sunny borders, and their more liberal planting in the open air should be seriously considered by lovers of choice hardy flowers.

Single and double Pæonies afforded a feast of the most pleasing colour harmonies. What at this season is there prettier or, indeed, handsomer than the single-flowered mauve-pink Pæony Beatrice? Many others were there, and all were good. *Genista Andreanus* is much cultivated indoors in pots, but it succeeds as well as the common Broom when grown entirely in the open air. The red and white forms of *Dictamnus Fraxinella* here and there in the group added to its interest and effectiveness.

#### Waterer's Rhododendrons.

Messrs. Waterer and Sons' display included some scores of large Rhododendrons in full bloom, and planted in circular and crescent shaped beds and borders. Here and there the grass margin ran out to a point, and was made use of for a standard Rhododendron. In such positions we found the splendid variety named Lady Eleanor Cathcart densely clustered with its deep rosy-cerise flowers. Then Sappho, which was recently figured in our pages, stood forth conspicuously from amid a host of other very good competitors. This variety is white, darkly blotched with deep purple on the upper segments. The loveliest of all, and seemingly very vigorous in growth as well, was the new Pink Pearl, a variety which *Journal* readers have also had the opportunity of seeing by illustration. The flowers are individually immense, and larger clusters of bloom have never been seen on any hardy Rhododendron.

To name a number of the sorts of greater excellence one must include the showy John Walter, with deep yet glowing crimson cerise flowers with wavy edges. *R. concessum* has moderately sized trusses of well-shaped flowers with a peach centre and rosy edge; very showy. J. H. Agnew, though not quite so intense as John Walter, yet very closely resembles it. *Gloriosum* is peachy

lilac coloured, and seems to be exceedingly floriferous. *Perispicum* is paler and not so taking as the last named; but Marchioness of Lansdowne should certainly not be overlooked. The mass of pretty flowers reminded me of *Dendrobium nobile* when at its best, though of course the Rhododendron was far larger in character. It is a showy and beautiful variety. *Mum* is nearly white, but with yellowish upper segments. Then Michael Waterer (all the Waterers are good) is a rich deep crimson with black spots on the upper segments. Princess Mary of Cambridge possesses finely built conical trusses, and is bold and showy. The centre is white, broadly edged with deep purplish mauve. Helen Waterer, with small but neat trusses, has a light centre and deep, rich crimson edge.

Strategist furnishes a good red—a brilliant rosy-cerise, and has large conical flowers. Mrs. Tom Agnew one always loves—it is so distinctive: colour, white, with yellow on the upper and inner part of the throat. *Everstianum* follows the colour of *R. ponticum*, so thoroughly well known, but the trusses are more magnificent. And, lastly, there is Lady Hillingdon, with enormously large inflorescences, each finely built. The colour is a delicate peach (the hue of the Peach flowers), with greenish yellow shading on the upper segments. The foregoing list may not have comprised all the choicer sorts, but it certainly represents varieties of unchallengeable merit. A group of *Kalmias* in flower greatly assisted the general exhibition.

The Society's gardens themselves had little to interest the visitor, as bedding had only been completed, and so few subjects were in flower in the open. Within the Lily house the *Victoria Regia* furnished the chief object of interest, and a fine healthy plant it is, with one large flower.

#### Mill Hill District.

A pastoral and grazing district, and splendidly wooded in every part, though rather hilly in places, is the district around Mill Hill, which one reaches on the way to Elstree on the Midland Railway. It is only a few miles from the City of London, and furnishes a rural haunt for a considerable number of holiday trippers. It is from the fresh green pastures and the umbrageous groves that much of the London milk supply is drawn. I looked from the eminence by Mill Hill School (a large and beautiful building for middle-class boys), out over hundreds of acres of undulating meadows and grassy slopes, all hedged over and dotted about with Oaks, Elms, and Beeches, and never a rood of arable land met my eyes. Mill Hill itself is a straggling village, which seems, indeed, to cover the entire parish! New highways and new villas are being largely made, the place being healthy, interesting, and within easy reach of London. It is here that the Member of Parliament for Hertfordshire—Mr. Cox—resides, and his mansion commands a beautifully varied prospect stretching over the valley southward to Harrow-on-the-Hill and away beyond to the hazy horizon.

Moat Mount, the name of the estate, possesses a garden that could not but be charming on such a naturally favoured spot. Unfortunately, however, the Parliamentary duties of the owner demand so much of his thought that his garden, which should afford recreation, is little appreciated, and it happens that the splendid features are not developed. The glass houses are in creditable condition, and Mr. W. Ferris, the head gardener, evidently brings much skill to bear on his vineries, peacheries, and orchard houses, judging from the fruitful and vigorous state of the occupants of them. Tomatoes, Cucumbers, Melons, Carnations, *Streptocarpus*, and stove plants are each exceedingly well grown. The houses are situated in a sheltered spot half way down the slope which falls from the mansion and continues to a valley below. They are surrounded on three sides by smooth grassy slopes, on which are beds of shrubs and plants. The *Sequoia gigantea* flourishes handsomely all over the estate, and so does the Redwood, *S. sempervirens*. *Araucaria imbricata* is another exotic tree whose proportions and general aspect augur well for the amenable conditions obtaining. The deciduous Cypress, *Taxodium distichum*, appears perfectly at home on the damp, mossy slopes, and was seen abundantly surrounded by great towering masses of the common and named Rhododendrons in full floral array. Add to these darker trees the beautiful grey trunks of graceful Beech trees, with handsome Elms, Tulip Trees, drooping Birches with silvery bark, purple Beeches, and giant Horse Chestnuts, and the scene must be recognised as one of uncommon diversity and charm.

Woodland walks abound, and pathways through the surrounding meads are not a-wanting. Here, too are water pools for fishing and boating, and where aquatic plants are husbanded. Passing through a colony of Roses and old-fashioned flowers, the higher grounds are scaled, and the parterre around Moat Mount appears. But there is no need for formal flower gardening here—the bold sweep of the lawn with its specimen trees and supporting belts of shrubbery back on either side, are beautiful in their simplicity. The house itself is dignified, though perhaps not handsome. And so we pass out along the winding avenue with its tall Bay hedge, its tasteful flower beds on grass, to the lanes outside the gates and the steep hills that lie around on all sides.—WANDERING WILLIE.

## Notes from Ireland.

June, with its expectant sultriness, is another instance of "hope deferred." The dawn brought rain in abundance with very cold evenings; in fact, they were wintry in the extreme, and rain is still the prevailing feature. The low temperatures have had a retarding effect on vegetation, especially on the Queen of Flowers, and the outlook for our summer displays is by no means pleasant, especially for the shows, or the weather will require a nice modifying if our rosarians are to make a gallant display. Carnations likewise show the depressing effect of the unkindly introduction to what should be summer.

Of the many hardy alpine flowers the *Ramondias*, with their bold, if not massive, foliage and their very free habit of flowering should entitle them to a place wherever alpine are grown. They are natives of the Pyrenees, and are also found in Thessaly. Although the list of available varieties is really limited—comprising in all about four, each of which should find a place in a pocket on your rockery—the following are available

Eagle. The fruits were extra large, of a rich golden hue, specked with the bright rose—an indication of ripeness—the flesh being firm, pleasantly flavoured, and very juicy. The tree was carrying a very heavy crop, and Mr. O'Kelly, his affable gardener, found it an indispensable variety. Indeed he finds no other variety equal to the strain of producing such a crop yearly. Certainly to those requiring Peaches for early work, considering cropping power and individual size of fruit, it recommends itself. I intend forwarding you a photograph of a branch from this tree; but owing to the low spanned nature of the house it is impossible to send a photograph of the whole tree. However, the ordinary branch will enable those who wish to see its fruit-producing capacity as grown at Dartrey.

Amongst the many good things unfolding their floral beauty the ubiquitous *Vittadenia triloba* should not be overlooked. Like the majority of plants, it has undergone the process of rebaptism, being no longer known as *Vittadenia*, but as *Erigeron mucronatus*. Its abundant Daisy-shaped flowers and fine lanceolate leaves render it an attractive plant. The flowers, when bursting, are deeply tinged with a purplish hue, but as they advance to maturity they lose this, leaving a zone of white

The Dutch Garden, Holland House.

for culture; *Ramondia Nathaliae*, which, either for growing on a wall or in a pot, makes a charming plant, and the blue flowers stand erect, the flower stalk about 4in high, and the flower is coloured a shade between purple and blue; if grown in a pot and cultivated in a cool greenhouse its period of flowering is much earlier and equally floriferous. There is also *R. pyrenaica*. This is very frequently described as *Verbascum Myconi*. It is a deep blue-coloured species, at present expanding its flowers in profusion, and has a variety named *alba*, which is not so frequently found in alpine collections. It is equally desirable, however, as it has all the good qualities of *R. pyrenaica*. The yellow-flowered *R. serbica*, hailing from Thessalonian shores, is equally desirable. This species has a doubtful advantage in being the possessor of a dual name, its synonym being *Jankaea Heildreichii*. If one were to see the *Ramondias* prior to flowering their foliage would suggest an experiment to acclimatise a *Streptocarpus*, and they are, indeed, closely allied to that genus. The foliage is nearly identical. The *Ramondias* are easily raised from seed in a compost of sandy loam with a seasoning of peat, whilst divisions of the crowns in spring will ensure a stock.

Early Peaches are always welcome, and for the gardener to be able to gather fruits by the first week in June without undue forcing is something to be proud of. On a recent visit to the gardens of W. Murphy, Esq., Dartry, Palmerston Park, I noticed a fine crop ready for use, the variety favoured being Golden

petals with a faded yellow disc. The plant is a native of Australia.

Amongst our borders the free flowering *Erinus alpinus* always does well, bedecking the rocky edges of its home with abundant bloom. It seemingly is indifferent to locality so long as one permits the roots to permeate a sandy loam. Like the pretty *Ramondia*, it likewise claims a home amongst the fastnesses of the Pyrenees.

The Japanese climber, *Wistaria chinensis*, is unfolding its pendulous racemes. Its lively lavender-blue colour lately showed to advantage at the Botanic Gardens attached to Trinity College. The view included *Cordylines* and other foliage plants, a fine clump of that yellow May-flowering Tulip Mrs. Moon, behind which was the *Wistaria*, flinging the gauntlet to the painter to depict the varying shades. At Glasnevin the *Victoria regia* is at present growing freely. Several leaves are forming, but owing to the want of adequate space those fine leaves, although necessary, must shortly be severed. [Last year the plant which is looked to as an annual feature in the Royal Gardens at Kew succumbed, and at present the plant intended to fill the great tank this summer is smitten like its predecessor, and many of the leaves are entirely spoilt by numerous holes in them.—Ed.] The pretty little Water Bean, one of the *Nelumbiums* is flowering freely in the lake, its white-fringed petals tossed to and fro on the wind, causing eddies.—A. O'NEILL.

## Old-time Gardening.

(Continued from page 517.)

It is now proper that a most remarkable book on rural and domestic economy should receive some attention. I refer to Tusser's "Five Hundred Points of Husbandry," &c., and as gardening is not largely treated of till the edition of 1573, I shall confine the remarks to be made entirely to that. Fuller truly says of Tusser that he "was successively a musician, schoolmaster, servingman, husbandman, grazier, poet, more skilful in all than thriving in any vocation—whether he bought or sold he lost." Yet his books are crammed with advice of the shrewdest, interspersed with the fullest details of the various aspects of country life as led by the better-class farmer in some of the southern and eastern counties.

Probably the most valuable portion of the book, from the horticultural standpoint, are the lists of fruits, vegetables, and flowers considered necessary by our author. In the January abstract the following list of fruits is given:—"Apple trees of all sorts, Apricokes, cherberies, bollese (bullace) black and white, Cherries, red and black, Chestnuts, Cornet Plums (perhaps a misprint, for 'cornel,' *Cornus mas*), Damisens (Damsons) white and black, Filberts red and white, Gooseberries, Grapes white and red, grene or grass Plums, Hurtelberries (*Vaccinium vitis-idaea*, Medlars, Ormerles, Mulberries, Peaches, white, red, and yellow fleshed; Peres of all sorts, Peer-Plums black and yellow, Quince trees, Raspes, Reisons (Red Currants), small Nuts, Strawberries red and white, Service trees, Wardens white and red; Wallnuts, Wheat (white), Plums."

Lists of flowers and vegetables are printed in the March Abstract. They are divided into sections, thus: "Seeds and Herbes for the Kitchin," "Herbes and Rootes for Sallets and Sauce," "Strowing Hearbs of all Sorts," "Herbs, Branches, and Flowers for Windows and Pots," "Herbs to Still in Summer," and "Necessarie Herbes to Grow in the Garden for Physic not Rehersed Before." To detail the whole of these lists would occupy too much space.

However, it may be said of the first, those employed in the composition of pottage—a mess of meats and vegetables, and sometimes oatmeal—that forty-six are named, of which exactly half the number are weeds or indigenous flowers. The second list contains those for cooking as dishes, or for consumption as salads, cooked or uncooked, or as pickles, and comprises twenty kinds, eight of which also occur in the first list. Cucumbers and Melons are included, and of the following he remarks:—"These buie with the penie, or looke not for anie." "Capers, Lemmons, Olives, Orenge, Rise, Samphire." The third list is a short one, comprising "Beans, Cabbages, Carrots, Citrons (Citrus), Gourds, Marews (a long-rooted Turnip), Pompion (Pumpkin), Parseneps, Runcivall Pease (an early variety which can be traced through four centuries), Rape, and Turneps."

The fourth list of "strowing" herbs are nearly all aromatic. It includes Daisies, Roses, Violets, Cowslips, and Pagles (*Polyanthus*). The remainder, sixteen in number, are still almost all in cultivation as "herbs." At this period they were in request to sprinkle over certain cooked dishes; to adorn nuptial couches, as in "Spenser's Epithalamion":—

Now bring the Bryde into the Brydall boures.  
The night is come, now soon her disarray,  
And in the bed her lay.  
Lay her in Lillies and in Violets,  
And silken courtains over her display.

The "Winter's Tale" contains a reference of a like nature. But apartments also were strowed with flowers, and on special occasions the very streets.

Strowe we the ground with Daffadownillies, &c.

The fifth list, consisting of flowers, is of the greatest importance, detailing as it does the flowers that were popular previous to the influx of exotics that commenced about this time. We also gather inferentially that the floral decoration of houses was even then provided for, though we know that decorating churches had been discontinued. Nor does it appear that flowers were worn on the person, as they certainly were at an earlier period, and again in the next century. This book on these accounts is so replete with interest that it tempts me to adventure on the good nature of the Editor to let it be printed, rejecting, however, some of the detail. It is as follows:—

"Baies, Batchelor's Buttons, Bottles (*Centaurea Cyanus*) blew, red and tawny, Collumbines, Campions (*Agrostemma coronaria*), Cowslips, Daffodondillies (including *Narcissus biflorus*, and perhaps *poeticus*), Eglantine, Fetherfew, Flower Armour (Floramor, or Prince's Feather), Flower de luce (*Iris Florentina*), Flower-gentle white and red (Lyte refers to three plants under this name—*Amaranthus hypochondriacus*, *A. caudatus*, and *Atriplex hortensis*), Flower nice (?), Gilleflowers red, white, and carnation; Hollihocks red, white, and carnation; Indian Eie (here *Tagetes erecta*), Lavender (includes *Santolina chamæcyparissas*), Larksfoot (*Delphinium consolida*), Laus tibi (?), *Lilium convallium* (Lily of the Valley), Lillies, red and white (*Lilium croceum* and *L. candidum*), Marigolds, double, *Nigella Romana* (*N. sativa*), Paoncies, or Hearts-case, Pagles, green and

yellow (*Polyanthus*), Pinks of all sorts, Queen's Gilloflowers (*Hesperis matronalis*), Rosmarie, Roses of all sorts, Snag-Dragons (*Antirrhinum*), Sops-in-Wine (three plants at this date were so-called, namely, *Trifolium purpureum*, *Medicago sativa*, and a single Carnation, the last-named, doubtless, Tusser's plants); Sweet William, Sweet John (a kind of the plant last named), Star of Bethlehem, Ornithogalum, Star of Jerusalem, (*Tragopogon pratensis*), Stocke Gilloflower (*Matthiola incana*), Tuft Gilloflower, *Dianthus prolifer*? Violets, yellow and black, and Wall Gilloflowers of all sorts (Wallflowers). The other lists are of no importance, being nearly all weeds.—B.

## Coronation Memorial Trees.

The latest intelligence from Buckingham Palace raises the hope that the Coronation of His Majesty is only deferred for a time, and that in the early autumn we shall yet celebrate that unique and joyful event. Be it so, and the trees so long prepared and kept for the intended midsummer planting will be brought forward in far greater numbers than they would have been in June. That we shall all plant yet, is our God-confiding hope.

The illustration of trees intended as memorials to be planted on Coronation Day is from a photograph sent to us from Mr. Jas. Barson, gardener to the Earl of Sandwich, Hinchbrook, Huntingdon, who tells us that the trees were prepared as shown, by Messrs. Wood and Ingram, nurserymen, Huntingdon and St. Neots. "The photograph," adds Mr. Barson, "is sent as a result of your recent paragraphs, especially the one which stated that the Dundee folks had been hunting for suitable trees and could not find them." Many of the specimens are very fine, several being over 16ft in height. The crates they are in can be let into the ground, and the trees, receiving no disturbance, can hardly fail to grow. They are at present in capital condition, the following list being the names of them:—British Oak, Scarlet Horse Chestnut, Copper Beech, Mountain Ash, Lime *Tilia dasystyla*, Beech (common), *Cedrus Deodara*, *Picea pungens glauca*, *Picea pungens argentea*, the Occidental Plane, Golden Oak, *Acacia inermis*, *Cedrus Libani*, *Cedrus atlantica glauca*, Scarlet American Oak, and *Cupressus macrocarpa lutca*.

## How the Street Merchant Saved Covent Garden.

After their disastrous experiences of Wednesday last week the wholesale dealers in flowers and perishable foods in London were quite prepared for anything that was bad to happen on the Thursday, and the most pessimistic predictions were largely fulfilled. To the glutted overnight markets there came in the dawn an abundant fresh supply. Its arrival was a torturing sight to the dealers. They made (says the "Daily Mail") a resolve to clear the markets at any cost. The Covent Garden florists were inclined to laugh at the result, for to men of experience it seemed so utterly impossible. They had practically only one class of customer—the flower girl. The flower girl, however, is not despised in Covent Garden, for many of the old dealers declare that she has saved the market many a time by coming in and clearing it at some sort of price—all for cash, too. Attracted by the "slump" reports in the papers, she went in force to the Garden on the Thursday, and, though the stock was so heavy that it was beyond her power to do anything like save the situation, she poured in pence and shillings to the dealers, who would otherwise have had absolutely nothing at all. This was the basis on which she did it:—

|                              | Ordinary Price.            | Thursday.  |
|------------------------------|----------------------------|------------|
| Extra Excelsior Lilies .. .. | 2/6 bunch .. ..            | 8d.        |
| Extra special Lilies .. ..   | 1/6 bunch .. ..            | 2d.        |
| Best Lilies .. ..            | 1/- bunch .. ..            | 1d.        |
| Longiflorums .. ..           | 2/- bunch .. ..            | 3d.        |
| Scarlet Geraniums .. ..      | 1/- bunch .. ..            | 2d.        |
| Odontoglossum Orchids .. ..  | 2/- to 4s. dozen blooms .. | 3d.        |
| Cattleya Orchids .. ..       | 18/- dozen blooms .. ..    | 2/6        |
| Roses, various .. ..         | 1/6 to 2/- bunch .. ..     | 2d. to 1d. |

In this way did the flower girl clear out Covent Garden till in the afternoon there was not a Rosebud or Orchid or a Lily left. The Rochford firm alone sold to the girls 509 dozen bunches of Lilies of the Valley, 906 dozen blooms of Lilies, and 171 dozen Orchids. A solitary girl, who does all her selling in the City, bought no fewer than 100 dozen Orchids. The fruit part of Covent Garden also had another very bad day. There was the same desire to get out at any prices as with the florists, and some classes of fruit were cleared, pence often being taken when shillings should have been. Really there were no prices to quote, for no offer was refused, and there were the widest variations, though all were down to an absurd level. Despite every effort, quantities of the best Peaches, Nectarines, and the like still remained on hand, and in sorrow and disgust the market shut up early and went off to try the Bank Holiday.

## Societies.

### National Rose—Temple Gardens, July 2nd.

Despite the lamentable backwardness and fluctuating character of the season, the National Rose Society had no cause to be dissatisfied with the exhibition presented on Tuesday last in the Inner Temple Gardens. The few warm and sunny days experienced just prior to the event were virtually the salvation of this, the main exhibition of the chief rosarians' year, and certainly the noble groups and line after line of superb flowers came quite as a revelation to very many of us. A week ago an exhibition of Roses in London was an impossibility, as evidenced at the Holland House Conference, and yet we are able to record the passing of one of the finest shows in all respects that the parent Rose Society in England has held during its history. Tuesday was certainly the day of the decorative Roses, and it is unnecessary to say that they are exceedingly popular, and increasingly so. The weather was dull, and at the moment of writing rain seemed imminent.

#### The President's Speech.

The veteran and greatly respected president of the Society, the Very Rev. S. Reynolds Hole, was induced to say a few words on behalf of the Society, which he did from one of the tables in the larger tent.

He said: We all of us know and respect the words of the Latin poet who said, "The things which we hear interest us much less than the things which we see." A few words I must say to explain the privilege of my being here. It is forty-four years since I opened the first Rose show held in England. Since that time, and chiefly owing to the National Rose Society, the Queen of Flowers has made wonderful developments in appreciation and culture. I need not praise the flowers, but I must mention the labours of my reverend friend Mr. H. H. D'Ombra (and I would he were here), who, I am pleased to hear, is better again; also Mr. Mawley, the secretary, and the other officials of the Society. You will see to-day, not only how the Rose can be developed for exhibition, but for their uses for decoration in the garden. The Dean concluded by thanking the Benchers for their kindness in allowing the use of the Inner Temple Gardens.

#### Nurserymen.

**GENERAL SECTION: DIVISION A:**—The premier class for seventy-two blooms in distinct varieties, for the Champion Trophy, Gold Medal of £6 in cash, brought forward five competitors, who staged clean, strong blooms of excellent colour, though lacking size in some instances. The best blooms chosen from all the collection were, to our mind, the following:—La France, Marchioness of Downshire, Bessie Brown, Ulster, Margaret Dickson, Mme. Luizet, White Maman Cochet, Rubens, Mrs. Sharman Crawford, Mildred Grant, Souv. de S. A. Prince, Mrs. J. Laing, Robert Scott, Papa Lambert, and Medea. It will be noticed that many of these are almost new varieties, and their excellence was unmistakable.

The honours finally fell to Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, Essex. Their collection included, in the back row: A. K. Williams, Catherine Mermet, Capt. Hayward, Caroline Testout, Cleopatra, Her Majesty, François Louvat, Killarney, K. A. Victoria, Mrs. J. Laing, Chas. Lefebvre, Margaret Dickson, Mrs. S. Crawford, Lady Clanmorris, Mrs. W. J. Grant, Rev. Alan Cheales, Suzanne Marie Rodocanachi, Ulster, Exposition de Brie, White Lady, Ulrich Brunner, Souv. de S. A. Prince, Prince Arthur, and Mildred Grant. Second row: Antoine Rivoire, François Michelin, Bessie Brown, Etienne Levet, Countess of Caledon, Horace Vernet, Ellen Drew, Général Jacqueminot, Margaret Appert, Lady Mary Fitzwilliam, Marchioness of Downshire, Marie Baumann, Maréchal Niel, Marquis Litta, Medea, Mme. Eugénie Verdier, Lawrence Allen, J. D. Pawle, Mme. de Watteville, Jeannie Dickson, Souv. de Pres. Carnot, Oscar Cordell, Souv. d'un Ami, and Exquisite. Front row: Beauty of Waltham, Bridesmaid, Comte de Paris, Devoniensis, Aug. Rigotard, Mme. Gabriel Luizet, Gladys Harkness, Duchess of Portland, Robert Scott, Mme. Cusin, Dr. Andry, Mrs. Cocher, Mme. Jules Grolez, Alf. Colomb, Dupuy Jamain, Papa Lambert, Mrs. F. Cant, Jean Soupert, Mme. E. Boullet, Marquis de Castellane, Victor Hugo, Helen Keller, and The Bride.

The second prize was well won by Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, with choice representatives of Mrs. W. J. Grant, Marchioness of Downshire, Ulrich Brunner, A. K. Williams, Souv. de S. A. Prince, Mrs. Sandford, and White Lady. Messrs. D. Prior and Son, Colchester, were strong as third, showing good blooms all round.

Class 2, for forty distinct varieties in trebles.—Here a large number of the Roses were more or less ragged, or at least not quite up to the higher standard. Three entered, the leading honours going to Messrs. Alexander Dickson and Sons, Limited, Newtownards, Co. Down, Ireland. The flowers were strong and bright, including, in the back row, the following:—White Lady,

A. K. Williams, Mildred Grant, Ulster, Bessie Brown, Horace Vernet, Helen Keller, Duchess of Portland, La France, Twinkelow, Lady Ashton, Comtesse Serenye, Marchioness of Dufferin, Mrs. W. J. Grant, Mrs. Edward Mawley, Lady Clanmorris, Alice Linsdell, Marchioness of Downshire, Kaiserin Aug. Victoria, and Mrs. S. Crawford. Second, or front row: Souv. de President Carnot, Robert Scott, Lady Mary Fitzwilliam, Caroline Testout, Bridesmaid, Muriel Grahame, Sir Robert Stout, Princess Beatrice, Golden Gate, Medea, Catherine Mermet, Niphotos, Souv. de S. A. Prince, Comtesse de Nadaillac, Mme. Cusin, Mme. de Watteville, Margaret Dickson, Countess of Caledon, and Dr. Andry.

The second place, out of three entrants, was occupied by Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, Essex, with good blooms of Dr. Sewell, Mrs. J. Laing, Marchioness of Dufferin, and Mrs. W. J. Grant. On the whole they were smaller and not so smooth as the Dieksons' Messrs. F. Cant and Co., Colchester, came in third.

**DIVISION B.**—In the third class for forty-eight blooms distinct there were five entries, but one of the competitors, Mr. A. Prince, was disqualified from having included two blooms of the variety Dupuy Jamain. The same exhibitor was also disqualified in the twenty-four Teas for the same mistake. Mr. Hugh Dickson, of the Royal Nurseries, Belfast, led off here, with very fair blooms indeed. The back row included: Rev. Alan Cheales, Danmark, Oscar Corail, Caroline Testout, Marquis Litta, Mrs. S. Crawford, Helen Keller, White Lady, Marchioness of Downshire, Bladud, Ulrich Brunner, Lady Quartus Ewary, Bessie Brown, Gustave Piganeau, Countess of Caledon. Second row: Comtesse de Ludre, Dorothy, Alphonse Supert, Souv. de President Carnot, Ulster, Mme. Hoste, Killarney, Captain Hayward, Marquis de Castellane, La France, Beauty of Waltham, Marjory, Earl Dufferin, La Fraicheur, Mme. Guillot, Marchioness of Dufferin. Third row: Duke of Wellington, Mme. Jules Grolez, Horace Vernet, Kaiserin Aug. Victoria, Gladys Harkness, Mme. Cadeau Ramey, Apotheker George Hoffer, Mrs. W. J. Grant, Jeannie Dickson, Margaret Dickson, E. Y. Teas, Anna Olivier, Heinrich Schultheis, Maman Cochet, L'Innocence, and Victor Hugo. Second in this class came Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, having splendid samples of Gladys Harkness, Tennyson, Mme. Bavary, La France, and Caroline Testout. Third out of five entrants came Messrs. R. Harkness and Co., Hitchin, Herts, with Lady Fitzwilliam, Rev. A. Cheales, La Fraicheur, and Dr. Sewell.

Six entrants contested for premier honours in Class 4, and here Mr. John Mattock, New Headington, Oxford, won with fair blooms, the names of which we give: White Maman Cochet, Mrs. S. Crawford, K. A. Victoria, La Fraicheur, Muriel Grahame, Gustave Piganeau, Mrs. E. Mawley, and Caroline Testout. Second row: Medea, Dr. Andry, Souv. d'Elise, Mme. Abel Carriere, Cleopatra, A. K. Williams, Hon. E. Gifford, and Bridesmaid. Front row: Margaret Boudet, Catherine Mermet, Dupuy Jamain, Capt. Hayward, Souv. d'un Ami, Duke of Teek, Caroline Koch, and Mrs. B. R. Cant. Mr. Geo. Mount, Canterbury, formed a very close and good second, with fine blooms of Caroline Testout, La France, and Mrs. W. J. Grant. Mr. C. Turner came third.

In class 5, for twenty-four distinct varieties, in trebles, the redoubtable Canterbury grower, Mr. Geo. Mount, proved the excellence of his blooms, being first. His blooms were large and well set up, including, in the back row: Ulrich Brunner, Mme. Gabriel Luizet, Bessie Brown, Mrs. S. Crawford, Duke of Edinburgh, Caroline Testout, Capt. Hayward, Catherine Mermet, Fisher Holmes, Mrs. John Laing, C. Lefebvre, and Her Majesty. Front row: Marie Baumann, Marchioness of Downshire, Beauty of Waltham, Mrs. Rumsey, Anna Olivier, Clio, Dr. Andry, La France, Gén. Jacqueminot, Mme. Tropot, Prince Arthur, and Margaret Dickson. Mr. Geo. Prince, Longworth, Oxon, second, and Mr. J. Mattock, New Headington, Oxford, third.

#### Teas and Noisettes.

**DIVISION I.**—Class 6, twenty-four blooms distinct. Lovely blooms were seen in all of the stands, and in this first class of the section Messrs. F. Cant and Co. (who won the special champion trophy same day out at the Richmond Show) were here in the forefront. The varieties were: Mme. de Watteville, Souv. de S. A. Prince, Souv. d'un Ami, Mme. Hoste, Mme. Cusin, Medea, Maman Cochet, and Rubens. Second row: Golden Gate, Mrs. E. Mawley, The Bride, Catherine Mermet, Cleopatra, Caroline Kuster, and Ernest Metz. Front row: Mme. A. Carmody, Innocente Pirola, Jean Ducher, Mme. Willermoz, Lady Roberts, Bridesmaid, Souv. d'Elise, and Etoile de Lyon. All were very superior. It was unfortunate for Prince, of Oxford, that he should have been disqualified for showing two of Souv. d'Elise Vardon. The blooms were exceptionally fine, and superior, perhaps, to Cant's. Messrs. D. Prior and Son were a fair second, and no third.

A dozen superb representative blooms were staged in the succeeding class by Messrs. Burrell and Co., who beat Mr. John Mattock and Mr. Geo. Mount, the second and third winners. Messrs. Burrell had White Maman Cochet, Ernest Metz, Com-

tesse de Nadaillac, Maman Cochet, Souv. de Elise Vardon, Cleopatra, Mme. Cusin, The Bride, Bridesmaid, Muriel Grahame, Etoile de Lyon, and Souv. d'un Ami. The blooms were well staged, but the labels almost impossible to read. The second collection was very fine indeed, and included good blooms of Mrs. E. Mawley, Princess of Wales, White Maman Cochet, and Cleopatra. Third, Mr. Geo. Mount.

Only two competitors entered class 8 for sixteen varieties in threes, Mr. G. Prince, of Oxon, winning. The blooms on the whole were fair, but not of superior merit. He staged Mrs. E. Mawley, Souv. de S. A. Prince, Comtesse de Nadaillac, Muriel Grahame, Mme. Cusin, Souv. d'Elise Vardon, Catherine Mermet, and Princess Beatrice in one box; and Souv. d'un Ami, Medea, Cleopatra, Maman Cochet, The Bride, White Maman Cochet, Bridesmaid, and Alba Rosea in the other.

#### Exhibition Roses in Vases.

Classes 9 and 10 were devoted to these, and though more artistic care might have been expended with advantage to the general complement, yet the blooms as thus seen were of great beauty and a delight to the eye. Mr. Geo. Prince was easily first, and staged his flowers with plenty of freedom, each being well held up.

Taller vases were used at the back, and all were arranged over black velvet. Comtesse de Nadaillac was very fine here, but so were all the others. Mr. Geo. Mount stuck more to the H.P.'s, which seem so coarse beside Prince's Teas and H. Teas; and Mr. C. Turner was third. Six entered. Mr. Prince again led in class 10 for nine distinct varieties, all well staged; and Mr. J. Mattock was second out of three.

#### "Garden" or Decorative Roses.

This section was undoubtedly the greatest assistance in aiding the show and its success. Messrs. F. Cant and Co. were equally to the fore here, as in the foregoing classes, and staged both good flowers and set them up well. Gustave Regis was lovely, as also Aglaia, Reine Olga de Wurtemberg, Ma Capucine, Mme. Louis Poucet, Crested Moss, Mme. Cochet, Rainbow, Thalia, Camoens, Macrantha, Souv. de J. B. Guillot, Claire Jacquier, Leuchstern, Fellenberg, Papillon, Mme. Pernet Ducher, Rubin, Anna Maria de Montravail, Gloire de Polyantha, Annie of Gierstein, W. A. Richardson, Rosa Mundi, Alister Stella Gray, and Blanche Double de Coubert. Messrs. G. Cooling and Sons, Bath, were second, their grouplet being too slack; and third Mr. J. Mattock. The grouplets were each rectangular and tiered, there being four stages for the vases, which were set on all sides.

In the class for eighteen distinct varieties, not less than three trusses of each, there were three competitors, Mr. George Prince, Longworth, Oxford, being placed first with a fine display, the best being Laurette Messimy, Marquis of Salisbury, Mme. A. Chatenay, Mme. Falcot, Mme. Eugène Resal, Souv. de Catherine Guillot, and Bellefleur. Mr. Charles Turner, Slough, followed with well arranged bunches of Royal Scarlet, W. A. Richardson, Gustave Regis, Purity, and Mme. Falcot; Messrs. B. R. Cant and Sons bringing up the rear.

For eighteen distinct varieties of summer flowering Roses, H.P.'s, H.T.'s, T's, and Chinas not admissible, there were five contestants, but no less than three competitors were disqualified for staging contrary to the schedule. Messrs. G. Cooling and Sons, Bath, secured the premier award, with good bunches of Purity, Crimson Rambler, Flora, Captain Ingram, Hebe's Lip, and Tuscany. The second award fell to Messrs. Paul and Son, Cheshunt, for good representative bunches of Old Black Moss, Morletti, Crested Moss, Blanche Moreau, and Carmine Pillar.

#### Open Classes (Nurserymen and Amateurs).

For twelve blooms of Hybrid Teas, distinct varieties, there were six competitors, and Messrs. B. R. Cant and Sons were awarded first prize for an even box of medium-sized blooms of good finish. The best blooms were Marquis Litta, Bessie Brown, La France, White Lady, Mrs. W. J. Grant, Killarney, Kaiserin Aug. Victoria, and Caroline Testout. Messrs. D. Prior and Son followed with good blooms of La France, Kaiserin Aug. Victoria, Mrs. W. J. Grant, Mildred Grant, and White Lady; and Messrs. F. Cant and Co. were third with smaller flowers of excellent finish.

The class for twelve blooms of any white or yellow Rose brought out four boards, Messrs. D. Prior and Son coming first with a good level board of Maréchal Niel; Mr. George Prince followed with fine blooms of Bessie Brown, and Messrs. B. R. Cant and Sons were third with Margaret Dickson in good form.

Twelve blooms of any light or dark crimson Roses found eight exhibitors prepared to face the judges, Messrs. B. R. Cant and Sons being a good first with excellent blooms of Ulrich Brunner; equal seconds were awarded to Messrs. F. Cant and Co. with a fine board of A. K. Williams; and Mr. Hugh Dickson, Belfast, with an equally good board of Rev. Alan Cheales.

A similar class for twelve blooms of any light pink or rose-coloured Roses brought out twelve exhibits of a very high

standard, Messrs. D. Prior and Sons being placed first with a glorious box of Mrs. J. Laing, Messrs. B. R. Cant and Sons being second with highly coloured blooms of Mrs. W. J. Grant; and Messrs. G. and W. Burch, Rose Growers, Peterborough, were third with La France.

The class for twelve blooms of any Tea or Noisette was poorly represented, only two exhibitors staging, Mr. George Prince winning well with a good box of Comtesse de Nadaillac, followed by Messrs. D. Prior and Son, who staged good blooms of the old Alba Rosea.

For nine blooms of any new Rose there was only one entry, Messrs. F. Cant and Co. taking the first position with a grand box of Mildred Grant.

Twelve blooms distinct varieties of Roses offered for sale since 1899: Here there were three entries. Messrs. Alexander Dickson and Sons, Limited, were first with a good board, which contained good blooms of Alice Lindsell, Mildred Grant, Ulster, Tennyson, Duchess of Portland, Red Christy, and Albert Stafford. Messrs. F. Cant and Co., Colchester, followed with good blooms of Mrs. Cocher, Frau Karl, Druschi, Gladys Harkness, and Tennyson; Messrs. Paul and Son, Cheshunt taking third place.

#### New Seedling Roses.

A number of novelties were sent forward, but none received the coveted Gold Medal, or even any mark whatever. Messrs. R. and J. Farquhar and Co., Boston, Mass., U.S.A., sent the Farquhar Rose, a Wichuriana-Rambler cross after the Dorothy Perkins type, but with paler flower clusters. Mr. H. Dickson contributed Lady Quartus Ewart, a white, or almost white, H.T.; Messrs. F. Cant and Co. had their H.T. Lady Roberts; Messrs. B. R. Cant and Sons had a hybrid Bourbon "Maharajah," with large velvety single crimson flowers. Mr. G. Prince had Teas, Longworth Beauty (deep tea-coloured), Longworth Fairy (rich cerise-crimson), and Souv. de Pierre Notting (tea, fawn and reddish); and Messrs. Paul and Son, their weeping rugosa alba.

#### Decorative Classes.

A decoration of cut Roses for dinner-table, arranged with any cut foliage, Ferns or Grasses, brought out seven contestants. Miss Maud E. West, Frith Dene, Reigate, secured first honours with a beautifully arranged table of cream and yellow Roses. The second place fell to Mrs. O. S. Orpen, West Bergholt, Colchester, for a pretty arrangement of white and red single Roses most tastefully arranged; Mr. J. Mattock being third with a light arrangement of Roses, in which Perle d'Or was the chief subject employed.

The set of three ladies' sprays did not bring out anything of an extraordinary character. Mrs. A. F. Harwood, 16, St. Peter's Street, Colchester, was first with heavy arrangements; Mr. J. Mattock came second with a much lighter display, though they were over-large; while Miss B. H. Langton, Raymead, Hendon, was third with beautifully light sprays.

#### Classes 24, 25, and 26.

The class for twelve bunches of single flowered Roses brought out three contestants. Here Mr. George Prince was well ahead, with good bunches of Austrian Copper, Lady Penzance, Paul's Carmine Pillar and Moschata Alba. Messrs. G. Cooling and Sons, Bath, were second, showing Rugosa, Macrantha, and Irish Glory in good style; while Messrs. Paul and Son, Cheshunt, brought up the rear.

Nine distinct Roses suitable for buttonholes made a pretty display, though there were only three competitors. Mr. J. Mattock being first with some capital varieties, which included Marie Van Houtte, Gustave Regis, Anna Olivier, W. A. Richardson, and Souv. de C. Guillot. Mr. Alfred Evans, Oxford, was second, and Mr. George Mount third.

A class was provided for nurserymen and florists to illustrate the decorative value of the Rose. Here Messrs. Paul and Son came to the front, having a good display of Roses suitable for this purpose. Lady Battersea, Leonie Lamesch, Polyantha Leuchstern, Royal Scarlet, and Paul's Carmine Pillar were excellent. Mr. George Mount was the other exhibitor and took second prize, but the exhibit hardly carried out the spirit of the schedule.

#### Amateurs.

The Champion Trophy class was contested by four exhibitors, but the veteran Mr. E. B. Lindsell, Hitchin, was again invincible, staging a good even stand. The varieties were White Lady, Ulrich Brunner, Bessie Brown, S. M. Rhodocanachi, Mrs. Mawley, Capt. Hayward, Mme. Hausmann, Muriel Grahame, Louis Van Houtte, Golden Gate, Horace Vernet, Bridesmaid, La France, Helen Keller, Mrs. W. J. Grant, Beauty of Waltham, Maman Cochet, Fisher Holmes, Lady Mary Fitzwilliam, Chas. Lefebvre, Mme. Cusin, Maurice Bernardin, Gustave Piganeau, Capt. Christy, Marie Verdier, Mme. Hoste, Duke of Wellington, Mme. de Watteville, Dr. Sewell, Mrs. J. Laing, Catherine Mermet, Ulster, Maréchal Niel, A. K. Williams, Mme. G. Luizet, and Souv. d'Elise Vardon.

The second prize was awarded to Mr. O. G. Orpen, West Bergholt, Colchester, who was a close second, and, remarkable to relate, all three medal Roses were found in this exhibit, Maman Cochet, the best Tea; Mrs. John Laing, the best Hybrid Perpetual; and Bessie Brown, the best Hybrid Tea. Other good blooms were: Souv. d'Elise Vardon, White Maman Cochet, Mrs. Cocher, Marchioness of Downshire, Catherine Mermet, Mrs. W. J. Grant, Dr. Sewell, and Mme. Jules Grolez, while the Rev. J. H. Pemberton, Havering-atte-Bower, was third.

In the class for twenty-four blooms distinct there were two competitors, Mr. R. E. West, Reigate, being placed first with a capital stand. The varieties employed being: Clio, Marquis Litta, La France, Mme. J. Pereire, Prince Arthur, Etienne Levet, Margaret Dickson, Mrs. J. Laing, Marie Rady, Maman Cochet, Dr. Andry, Princess of Wales, S. M. Rhodocanachi,

Mrs. W. J. Grant, Bessie Brown, Marquise Litta, and Mrs. J. Laing in good form.

For twelve trebles distinct Mr. E. B. Lindsell was the only competitor in the field, and he richly deserved the first prize awarded. The best were Captain Hayward, Mrs. S. Crawford, Lady Mary Fitzwilliam, White Lady, and Mrs. W. J. Grant.

For twelve blooms any Rose except Teas or Noisettes there were two competitors, Mrs. Haywood, Woodhatch Lodge, Reigate, being first with a level box of Mrs. S. Crawford, and the Rev. J. H. Pemberton second with a weather-stained box of Bessie Brown.

#### DIVISION D.

The Ben Cant Memorial prize for twenty-four blooms distinct varieties called forth five stands, the first position being taken by

Coronation Memorial Trees. (See page 14)

Rubens, Le Havre, Beauty of Waltham, Caroline Kuster, Ernest Metz, Mrs. Sharman Crawford, Gustave Piganeau, Capt. Hayward, Princess Mary of Cambridge, and Alba Rosea. Mr. Alfred Tate, Downside, Leatherhead, was second with rather smaller flowers, the best being Capt. Hayward, Bessie Brown, La France, and Medea.

#### DIVISION C.

The following class, also for twenty-four blooms, but was an extra, and intended for those amateurs who have not previously won the Champion Trophy or the first prize in this class.

For twenty-four blooms distinct there were only two competitors, Mr. O. G. Orpen being first with a box of medium quality, the best varieties being: Mrs. J. Laing, Kaiserin Augusta Victoria, Augustine Guinnoiseau, Medea, Souv. de S. A. Prince, Maman Cochet, and Mme. Eugene Resal. The Rev. J. H. Pemberton made a good display for second position, staging

Mr. E. M. Bethune, Denne Park, Horsham, for a moderate display, the best being: Crown Prince, La France, Catherine Mermet, White Maman Cochet, Bridesmaid, Souvenir d'Elise, and Mrs. E. Mawley. Mr. F. Wellesley, Westfield, Woking, staging well for second place with good blooms of Mrs. W. J. Grant, White Lady, Bessie Brown, White Maman Cochet, and Kaiserin Augusta Victoria.

For eight distinct varieties of three blooms each five competitors staged. Mr. Ed. Mawley, Berkhamsted, being a good first with glorious blooms of Mrs. E. Mawley, and typical triplets of Caroline Kuster, La France, The Bride, and Mrs. W. J. Grant. Mr. E. M. Bethune followed with a less creditable exhibit, the best being Mrs. Sharman Crawford, A. K. Williams, and Marquise Litta, Mr. R. E. West being a creditable third.

For nine blooms of any Rose except Tea or Noisette there were five entries, the first prize going to Mr. E. M. Bethune for

a good box of Mrs. Sharman Crawford; Mr. W. C. Romaine, The Priory, Old Windsor, securing second with well-coloured Crown Prince, Mr. R. E. West being third with La France.

## DIVISION E.

The growers of less than one thousand plants came out strongly, no less than nine growers staging in this class, Mr. F. R. Curtis, Wokingford, Colchester, being well to the fore for first place. He had good blooms of Mrs. J. Laing, Souv. de S. A. Prince, Mme. Jules Grolez, La France, and Helen Keller. Mr. Thomas B. Gabriel, Elmstead, Woking, was second with a good board, which included good examples of Mrs. Ed. Mawley, Capt. Hayward, Caroline Testout, Clio, and La France, and Mr. G. W. Cook, Muswell Hill, brought up the rear.

The class for six blooms of any Rose except Tea or Noisette was represented by seven entries. Mr. S. B. Gabriel was placed first with good blooms of La France, followed by Mr. G. W. Cook with Bessie Brown, and the Rev. R. Powley, Upton Scudamore, third with pretty blooms of Kaiserin Augusta Victoria.

## DIVISION F.

The class for nine distinct varieties appeared popular, for there were eleven entries, the first prize being awarded to Mr. R. W. Bowyer, Hertford Heath, Hertford, who staged good flowers of Caroline Testout, White Lady, Marquis Litta, and Mrs. Edward Mawley—a strong exhibit; Mr. L. N. Times, Hitchin, being placed second, and Mr. G. A. Hammond, Burgess Hill, third.

For six blooms distinct there were only three entries, Mr. Charles K. Douglas, Rathmolyon, Co. Meath, securing first with a well balanced exhibit; while Messrs. R. Boswell, Hitchin, and E. R. Smith, Esq., Muswell Hill, followed in the order named.

For six blooms of any Rose except Teas or Noisettes there were four entries, the first prize going to Mr. G. A. Hammond, who staged good blooms of Bessie Brown; Mr. R. W. Bowyer was second with well coloured Marquis Litta, and Mr. Charles K. Douglas was third with Bessie Brown.

## DIVISION G.

For six blooms distinct Mr. Charles Lamplough, Chatteris, Cambs. was first; especially good were his flowers of Kaiserin Augusta Victoria, Xavier Olibo, and Ulrich Brunner. Mr. H. Williams, North Finchley, came second, and Mr. H. E. Molyneux, Balham, third.

Six competitors staged for the Challenge Cup, which coveted award was secured by Mr. G. A. Hammond, who placed a great deal of strength here; especially good were La France, Caroline Testout, Mrs. E. Mawley, and Killarney. Mr. George Moules, Hitchin, was second with a capital board, and Mr. H. P. Landon, Brentwood, was third.

For four, in trebles, there was an excellent competition, nine boxes being staged, the first award going to the Rev. F. Page Roberts, Halstead Rectory, Sevenoaks, the varieties being Marquis Litta, Souv. de S. A. Prince, and Antoine Rivoire. Mr. Ernest Wilkins, Sideup, was second, and the Rev. R. Powley third.

The Ramsey Cup was contested keenly by nine exhibitors, Mr. Alexander Hill Gray, Newbridge, Bath, securing the coveted award with good blooms of Golden Gate, Maman Cochet, White Maman Cochet, Princess Beatrice, and The Bride. The Rev. J. H. Penberton was a close second with typical blooms of Danmark, Comtesse de Nadaillae, and Mrs. J. Laing; and Mr. E. M. Bethune third.

The novices' class for six blooms distinct brought out six entries. The premier award fell to Mr. Chas. K. Douglas for a strong six, followed by Mr. Claude Magniae, Esher; while the third position was allotted to Mr. Lewis S. Pawle, Harrow.

In the class for six blooms distinct, the novices responded with eight entries. Mr. Joseph Wakeley, Rainham, was well to the fore, the stand being level and good, Miss Lillyett, Reigate, following, and Mrs. Du Buisson, Guildford, third.

There were seven competitors in the class for amateurs who have joined the society since the last metropolitan exhibition, the first prize going to Mr. E. J. Holland, Sutton, for a creditable exhibit, Mrs. Harry Thomas, Windlesham, following, and Mr. C. W. E. Duncombe, Stanstead Abbots, Herts, third.

## Ladies' Class—No. 63.

In one of the large tents this section of the schedule provided the chief display, and very delightful were each of the contributions, especially the simple arrangement of Messrs. O. G. Orpen, done in Lady Penzance Briar and Fortune's Yellow. The vases were low, and only numbered seven pieces in all. The very fine gauze-looking lace matching the flowers in the centre was very sweet, and a wise addition. Miss Elsie Watney, Shermanbury, Reigate, was second with a very different display, having a high glass vase in the centre, and numerous smaller ones in other positions. These were filled with single red Roses. Mrs. J. P. Fearson, Birdhurst, Reigate, and Miss Beatrice H. Langton, Raymead, Hendon, N., were equal third. There were fourteen tables in all.

## Best Blooms.

Six of the Society's Silver Medals are awarded, and on this occasion, in the nurserymen's section, the medal for the bloom other than H.T., Tea, or Noisette, fell to Messrs. F. Cant and Co. with Mrs. J. Laing. The same firm received the medal for the finest H.T. with Mildred Grant. For the best Tea or Noisette, Mr. J. Mattock was the recipient with Cleopatra.

Amateurs' Division.—Mr. O. G. Orpen received the three medals for the best blooms in this section, the three being in one collection (class 27, for thirty-six blooms). Mrs. J. Laing was the best other than H.T., T., or N.; Bessie Brown the best H.T., and Maman Cochet the finest Tea.

MISCELLANEOUS EXHIBITS.—In the non-competitive section Messrs. W. Spooner and Son, Arthur's Bridge Nursery, Woking, admirably staged a collection of garden and Tea Roses, the H.T.'s also being liberally included. In large bunches he showed Aurore (China), F. Kruger, Marie Van Houtte, Bridesmaid, The Bride, Mrs. W. J. Grant, and White Maman Cochet. Messrs. G. Jackman and Son, also from Woking, furnished a similar display.

Messrs. George Bunyard and Co., Maidstone, were very strong in the decorative Roses of the garden, showing large bunches in vases, the Austrian Briars, the Moss Roses, Ramblers (including Leuchstern), polyantha Paquerette, Aglaia, Mignonette, and Gloire de Polyantha. They had also Mme. Jules Grolez, Camoens, Amazone, Mme. Chedane Guinoisseau, Lady Battersea, and other Teas and H. Teas.

Messrs. Laxton Bros., Strawberry specialists, Bedford, were able on this occasion to present their splendid new Strawberry, "The Laxton," of which we gave a figure and full description last year, when it was introduced. The fruits were large, deeply coloured, odorous, firm, and of good flavour.

Some of the lesser classes in the Amateurs' division are not here reported, chiefly owing to the lack of time and the difficulty of finding them after the tents became filled with visitors. We are pleased to state that the attendance was very good in the afternoon, and the weather brightened considerably. The band of the 1st Life Guards played from two till six.

The New *Deutzia gracilis rosea*.

Everyone knows the shrub *Deutzia gracilis*, and but few shrub collections do not contain it. A variation is among recent introductions, the difference lying in the flowers, which are daintily tinged rose on the outside of the petals. It is a charming flower, and will be warmly welcomed. The colour (says Meehans' Monthly) may not hold when the flowers are forced in green-houses.

## A Famous Old Garden.

From Blackie's "Picturesque Tourist of Scotland," published in 1846, we extract the following, which relates to the long extinct experimental garden of the Royal Caledonian Horticultural Society:—"The Caledonian Horticultural Society was established in 1809, since which period large sums have been expended annually on the production of new fruits, flowers, and vegetables, and in perfecting and bringing to maturity those already introduced. In the centre of the garden stands a spacious and elegant hall for the meetings of the Society, adorned by a marble bust, by Steele, of the secretary, Dr. Neill; and in front of the hall, a fine lawn is laid out as a promenade ground. Here it is that the several exhibitions of exotic plants annually take place, attended by all the beauty and fashion of the city. The garden is arranged into various compartments, having soils suited for the different collections placed in them. The raised belts which surround and intersect the garden are occupied as an Arboretum, and contain authentic named specimens of all the newer kinds of trees and shrubs. There is an Apple orchard containing specimens of upwards of 900 named varieties; and a Pear orchard, containing upwards of 450 varieties. The collections also contain 85 varieties of Plums, 25 of Cherries, 27 of Currants, and 30 of Raspberries. The kinds of Strawberries are very numerous, extending to no fewer than 120 sorts, and of Gooseberries the collection is still greater, exceeding 400 kinds. One of the chief objects of the garden is also to exhibit the most approved kinds of culinary vegetables in a growing state, dully tallied (labelled) so as to form a school for the information of those visiting the garden; and to test such novelties or rarities as may from time to time be recommended, to make trial of various manures, and to exhibit different modes of culture." The garden, we may add, contained ten imperial acres, and commanded one of the finest views of Edinburgh from the north. It was situated at the further end of Howard Place, northward from the old village of Cannon-mills, and over the Water of Leith. The Royal Botanic Garden is situated further up on the same side.

### Fruit Forcing.

**CUCUMBERS.**—Attention must be given to plants in full bearing by way of thinning the exhausted growths and foliage, laying in young bearing wood, stopping one joint beyond the fruit, and earthing the roots periodically. Copious supplies of water or liquid manure will be required about twice a week, or as may be necessary; but avoid applying it too strong. Syringe at closing time, and maintain a good moisture in the house all day long by sprinkling the paths and walls as necessary, but avoid applying the liquid too strong. To stimulate plants in full bearing, a top-dressing of sweetened horse droppings sprinkled on the surface of the bed, and on this about a handful of soot per square yard, will do much to further root action, supply nourishment, and put substance and deep green colour into the fruit. If more be needed, liquid manure in the form of phosphate of potash and nitrate of ammonium, two parts the former and one part the latter in mixture, dissolving  $\frac{1}{2}$  oz of the mixture per gallon of water, and applying about once a week an amount equal to an ordinary watering. If there be eel-worm, the liquid manure may be alternated with Little's soluble phenyle one in 1,000, or one fluid ounce to  $6\frac{1}{4}$  gallons of water. Do not overcrop young plants, nor allow the fruit to hang too long, as upon attention to this depends in a measure a good and continuous supply. A few seeds may now be sown for a late summer and autumn supply of fruit; they will germinate, and the seedlings be fit to plant out, in about a month.

**MELONS.**—Where fruit is required late, a last sowing may be made for growing in frames or pits, heated by fermenting materials. Make the bed up at once, sowing the seeds in 4in pots—one or two seeds in each—the pots being half filled with soil, and a supply of soil being given as the plant advances, but not higher than half an inch from the seed leaves; they can be turned out when the bed is ready, giving a good watering at planting, and shading from bright sun until established. One plant in the centre of each light is sufficient, its point being taken out at the second rough leaf, this will result in the production of side shoots, which reduce to four, taking two to the front and two to the back of the frame, rubbing off the laterals to within 6in of the stem, and stopping the primary shoots a foot from the sides of the frame or pit. The plants will show fruit on the laterals, which, being fertilised, will set early in August, and ripen towards the close of September.

**SETTING MELONS IN FRAMES.**—Plants that were raised some time ago and have been put out will grow rampantly, and are sometimes difficult to set fruit, especially during moist weather. It arises from the moist atmosphere, crowding, and closeness; therefore thin the growths if too crowded, then fruit will show on the laterals, or if not, stop these to two joints and fruit will appear on the sub-laterals. Water sparingly, pouring what is necessary to keep the plants from flagging between the shoots so as to wet the surface as little as possible. Place hot manure against the sides of frame, or grass mowings will do, with a little over the grass. This will raise a gentle heat, admitting of a little ventilation constantly day and night. Fertilise the flowers when fully expanded, stopping the shoots at the same time one joint beyond the fruit. Admit air freely if the weather permits, increase the ventilation at 70deg, allowing it to rise to 80deg or 85deg or 90deg, at which keep through the day, closing at 80deg, except the small portion before alluded to. When the fruit is set, reduce to three or four on a plant, according to vigour, and encourage growth by watering as required, and sprinkling the foliage at closing time. Commence ventilating from 75deg, allow the heat to rise to 85deg or 90deg. Close before the temperature recedes to 80deg, or between 4 and 5 p.m. Growers who have well-heated, light houses will have no difficulty in maintaining a supply of fruit through October or November from sowings made up to the third or fourth week in July.

**PEACHES AND NECTARINES. — EARLY FORCED TREES.**—Continuous forcing to have the fruit ripe in May and early in June taxes the energies of the trees, as they have to make the growths during the early months of the year and mature them in early summer. After the fruit is all gathered, ventilate to the fullest extent, if possible removing the roof lights by the middle of July, or sooner in the case of very early forced houses if the weather is hot and the growth sufficiently matured. If the roof lights are not moveable, in addition to ventilating to the fullest extent, the borders should be duly damped and properly watered, so as to keep the foliage fresh,

and no check given likely to induce the premature ripening of the young wood and leaves. Keep the foliage free from red spider by syringing occasionally, applying an insecticide, sparing no pains to keep the foliage clean and healthy, thus enabling it to mature naturally. Stop laterals likely to interfere with the principal growths, but moderate lateral extension will promote root action and appropriate an excess of nutriment which, forced into the buds, may result in an undue development. All shoots that have supported fruit and are no longer required, should be removed to let air and light freely to the growths, and if there is too much crowding of the shoots for next year's bearing, thin them well to admit sun for solidifying those left.

**HOUSES WITH FRUIT RIPENING.**—A temperature of 60deg to 65deg at night and on dull days, with 70deg to 75deg from gleams of sun, and 10deg to 15deg advance from bright sunshine is essential to the swelling and securing quality in the fruit. Except on cold nights and in dull weather, little fire heat will be required, but changes come suddenly, and attention must be given to circumstances, so as to maintain steady progress, and admit of a little air constantly for securing flower and good finish. Afford moderate air moisture, but withhold water from the fruit after it commences to soften, damping the floors and borders whenever they become dry, supplying water as required, and a mulching of spent, rather lumpy manure will keep the surface in a moist condition and favourable to the activity of the roots, and that without overdue atmospheric moisture. If the weather be bright, some netting spread over the roof lights will be an advantage in preserving the delicate skinned varieties, such as Noblesse, from unduly heating by the sun's rays, causing the fruit to ripen at the apex greatly in advance of those on the lower parts, and the fruit not infrequently decays there through over-ripeness, whilst the lower part is quite hard. These, indeed all fruits, are better ripened gradually than by being much heated, as is sometimes done under the large and clear panes of glass rightly employed in modern glass structures for growing fruit. A double thickness of herring net, or a single thickness of pilchard net, drawn over the roof lights will sufficiently break the most powerful sunlight, insuring the fruit ripening evenly. The shading may remain on after the fruit is gathered, and greatly conduces to the preservation of the foliage, insures the perfecting of the buds, preventing malformation or premature maturity, and this signifies less danger of the buds falling.

**YOUNG TREES.**—Inattention to disbudding these, or leaving more growths than absolutely necessary for bearing and furnishing the trellis, is a great mistake. The principal branches or shoots to form them should be 12in to 15in distance apart, and the shoots for next year's bearing, originated from the preceding year's shoots, disposed about 15in asunder along them, stopping if necessary at that extent of growth, and the laterals to one leaf as produced. The extension, or main shoots, should be trained in their full length, provided they are evenly balanced. If the shoots are stronger on one side than the other, depress the strong and elevate the weak, so as to induce an equal distribution of vigour throughout the tree. Any gross shoots may be stopped, but it is better to cut out excessively strong wood, as it is difficult to restrain, and often succumbs to gumming, therefore encourage sturdy, short-jointed growths. Ventilate early in the day, increase it with the advancing temperature, avoiding a vitiated atmosphere by leaving on a little air constantly. Essential growths must be trained so that sun and air have access to them freely, keeping them thin and the foliage clean.

### Kitchen Garden.

**BROCCOLI.**—Suitably prepared plants, as, for instance, those which have been transplanted several inches apart in order to strengthen, may now be planted out finally. Those which have been half-starved by crowding in seed beds are a considerable time recovering from the effects of such treatment, and never make good plants in comparison with the better treated plants. All the varieties of Broccoli like good firm ground. For autumn use plant Michaelmas White and Veitch's Self-Protecting. For the winter and main crop there are many excellent kinds, including Cooling's Matchless, Frogmore, and Knight's Protecting, Snow's Winter White, and Osborn's Winter White. For the late crop Cattell's Eclipse, Late Queen, Chelsea Favourite, and Veitch's Model are excellent. For the autumn crop planting may be done on loose but rich ground if firm is not available, but for the winter and spring crops very firm ground is essential. In most cases plant 2ft apart between the rows, the plants being 18in.

**PEAS.**—The early varieties of Peas will now be over, and the haulm may be removed, but the second early varieties and main crop sorts are developing, and should the weather be hot and dry a liberal mulching down each side of rows is very helpful, not only to assist in retaining the moisture in the soil, but to

economically distribute any water or liquid manure which may be found necessary to apply to the roots. A last sowing of Peas may be made, selecting well pulverised and manured ground, and drawing the drills rather deeper than for ordinary sowing, as much dry and hot weather may be experienced at a time when the Peas are needing considerable support. For this last sowing the early varieties only can be depended upon to give good results. A situation sheltered from winds should be chosen. The great enemy to late Peas is mildew, but with generous treatment and ample room this pest may be kept at bay.

**FRENCH BEANS.**—With a good supply of Scarlet Runners these are not so much in demand in autumn, but a few rows may, nevertheless, prove to be useful; therefore, if room can be found it is advisable to sow a row or two in the usual way.

**CELERY.**—The main and late crops of Celery may now be planted. Where there is much in demand, double rows might with advantage be planted, though they are more trouble in managing. The latest rows should be single ones, the plants passing through the winter better, moisture not hanging about them so much. During this month Celery plants are inserted which have become overgrown by remaining too long in the nursery beds. These are long in recovering. Use none but sturdy plants, which lift well from their temporary positions, and properly treated scarcely feel the effects of removal. To established rows of Celery afford adequate supplies of water to the roots, and trim away the suckers which are springing from the base, and remove weeds.

**POTATOES.**—Early varieties may be dug as wanted from the open ground. Remove all haulm from the soil after the tubers have been picked up, and make the surface level.

**ENDIVE.**—A sowing of Endive should be made in drills a foot apart, and on moderately rich ground. Thin the seedlings early and transplant later some of the strongest young plants, hoeing among them frequently to promote growth.

**SURFACE CULTURE.**—Weeds ought to be cut down between growing crops on every sunny day, with the Dutch hoe. If the ground has been trodden hard between Beans or other crops it may be necessary to bring a fork into use to loosen the soil.

**MUSTARD AND CRESS.**—Sewings of these may be made frequently outdoors in a shaded position, sowing on the surface, shading and maintaining moist.

## Young Gardeners' Domain.

### *Eucharis grandiflora*

How seldom we find these beautiful and useful flowering plants grown as they deserve to be in gardens of note. At Christmas and New Year few of our inside flowering plants are more useful than the *Eucharis*—a time of the year when the country mansions are filled with parties, and flowers are greatly in demand for table decorations. *Eucharis* flowers and foliage of *Pancratium fragrans*, or small *Richardia* leaves, may be used, the flowers lasting for a long time after they are cut if a small portion of the stem is taken off every few days. I think many failures may be put down to three things—viz., not sufficient water, too much drying off at the roots, and too much heat. Our mode of culture may surprise some. When the plants require to be potted they are given good fibrous loam and a sprinkling of bonemeal and sand, and a good drainage in the pots. Once a plant is established it is best left alone for four or five years and not disturbed, for if so it will most likely cause a failure. I think when once you have got *Eucharis* in good health and doing well leave well alone. The chief aim should be to get the pots filled with healthy bulbs and roots, and then, with liberal feeding, they can be kept in good condition for several years.

We find liquid manure from the cowsheds and soot water as good as any manure. This is applied once or twice weekly. The plants are kept well supplied with water right through the year, never once allowed to become dry at the roots. Most growers keep them on the dry side, or, rather, withhold water from them for a time. But we never do this. Twice and three times during the season we get them to flower. But Christmas is the time we get the most and best spikes, most of which are over a yard in length with six and seven flowers on them. With regard to temperature, an intermediate one is suitable, with the glass about 50deg at night during the winter months. This is where the plants are grown the whole year round. They are also grown under the stages, with water always under them, and seem to delight in it. We are seldom without a few spikes of *Eucharis* at any time from these plants.—J. B., Bucks.

## Trade Catalogues Received.

M. Herb (formerly Herb and Wulle). Bulb and Seed Grower, Naples.—*General Catalogue of Bulbs.*

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**CURRENT LEAVES FALLING (J.).**—Probably the bushes have been suffering from drought, which the recent rains would no doubt assist materially in remedying. If the bushes are old and weak a mulching of manure or a good supply of liquid manure would prove beneficial.

**WEED KILLER (Idem).**—There is no such thing as a non-poisonous weed-killer, for what will kill weeds will destroy useful crops, it being only a matter of degree, some plants being more susceptible of injury than others, and the articles are poisonous, though not likely to cause injury to man or useful animal life when applied according to the instructions. We advise a solution of carbolic acid, No. 5, in 100 parts of water, for killing weeds on walks, pavements, &c., distributing by means of a rose watering can, and keeping from grass, Box, or other edgings, for the acid is no respecter of vegetation. Avoid getting the acid on the hands, even the diluted article, or it will injure the skin.

**GOLDEN-LEAVED FUCHSIA TURNING GREEN (Amateur).**—Most likely your plant is turning green in consequence of having been recently potted in a richer material than that in which it was before, whereby a degree of grossness is induced fatal to variegation both in this and in many other plants. We are unable to maintain the golden colour in our Japan *Euonymus* when they are planted out of doors, and it is the same with many other plants. In the case of your Fuchsia, if it is not placed in too large a pot we would not disturb it now, but wait until the pot be filled with roots, and most likely the proper colour will be restored as the plant's vigour becomes checked. Water also sparingly, and do not let the plant flag.

**ARTIFICIAL MANURE FOR VINES (T. Q.).**—The Vines that are carrying good crops would be benefited by a top-dressing of fertiliser, the final one being given at the completion of the stoning process, so as to help the Grapes in their last swelling and profit the Vines in storing matter and perfecting the buds for next year's crop. Of the three articles you mention, namely, bonemeal, dissolved bones, and Thomson's Vine manure, the latter would be most serviceable, as it is a good all-round fertiliser; but as you may have used this and may prefer something different, you may prepare a mixture of five parts of dissolved bones, dry and crumbling, 2½ parts sulphate of potash, and 1 part sulphate of magnesia, mixed, applying 4oz of the mixture per square yard, and pointing in very lightly, afterwards watering in moderately. This will help the Vines to finish the current crop and material remain for use in the future.

**GRAPES FOR EXAMINATION (One Perplexed).**—The berries are both shanked and scalded, the former represented by the withered footstalks and the latter by the depressed spots, the other part of the berry remaining green and sound. The shanking is generally due to a bad condition of the roots, the soil having become sodden and sour, for which lifting is the most satisfactory, or it may in the case of an old Vine not be possible to so act, or only partially, removing the soil from amongst and over the roots at the collar and supplying fresh loam or compost in place of that removed. This practice we have known to effect wonders with old Vines, new roots being encouraged from the collar, and they extend outwards near the surface, and the Vines profit accordingly. This should be done in late summer, as soon as the leaves give indications of ripening. If you cannot do either, apply a good dressing of air-slaked lime, say 2lb per square yard, and leave on the surface, or if objectionable in appearance cover with a little soil, very little, or better not any. The lime will act to some extent as a corrective of the soil sourness, as some lime will enter the soil in solution, and very often the roots of the Vines come up into it. The scalding can only be prevented by admitting a little air constantly and increasing it before the sun has acted on the house, so as to raise the temperature considerably, moisture being condensed on the berries, and these heated, scalding ensues. It never occurs outdoors, therefore admit air freely and keep moisture from the berries even if a little extra fire heat has to be employed. We should say there is too much moisture in the house, this being kept too close and moist, therefore ventilate early and freely, though too late for this year.

**MARECHAL NIEL ROSE LEAVES DISEASED** (A Young Beginner).—The leaves appear to be attacked by orange fungus, to destroy which dissolve 2oz of blue vitriol in hot water, and then add 3 gallons of cold water, and with this sponge the leaves or syringe the tree; and as the fungus is chiefly on the under side of the leaves care should be taken to wet them there with the solution. Supply liquid manure, and if planted out mulch with partially decayed manure. Softsoap at the rate of 4oz to the gallon is also good against the parasite, but not nearly so effectual as the vitriol water.

**STRAWBERRIES EATEN BY SLUGS** (J. P., Dublin).—We do not know what you can now apply to prevent the fruit being eaten by the slugs; but you may raise the fruit above the ground or mulching material by some forked sticks thrust into the ground, and place the trusses so that they rest in the fork of the sticks. This will save the majority of the fruit. Securing the trusses of fruit to small stakes will answer nearly as well, but is more tedious. We use crinolines formed of galvanised wire, which answer perfectly, not a fruit so far as we have observed being eaten by slugs.

**FLIES AND CATERPILLARS TO NAME** (H. R., Kent).—The fly with the long, narrow body is a *Pembla*, one of the *Ichneumonidae*, which, by its larvæ, is parasitic on grubs or maggots of other insects that burrow and live in old wood, such as old posts and palings, hence it has the best possible right to protection. The brown insect resembles the scorched wing moth, *Eurymene dolobraria*, but both insects were very much rubbed. Its caterpillars feed on Oak and Beech trees. The caterpillars are those of the common tiger moth, *Arctia caja*, which feed on a great variety of plants in gardens, and commonly known as the "woolly bear," from its dense coat of long hairs.

**VINES ON LONG ROD SYSTEM** (H. S.).—The Vines should have the eyes rubbed off so that the bearing shoots (not laterals) are 15in to 18in distance apart. This is essential to admit light and air to the bearing shoots to insure the proper development and finishing of the crop. The most probable cause of the shoots having in some cases more vigour than others is their taking the lead and exhausting the stored-up sap in the rod, and though the three most vigorous canes have been detached, the remaining ones having no such supplies to draw upon are comparatively stationary. Another reason is that the flow of sap is most abundant at the upper part of the cane or rod, and the shoots are consequently most vigorous. The Grapes are scalded, which is due to the sun or heat acting on the berries whilst covered with moisture. When Grapes begin colouring they should have a little ventilation constantly.

**NECTARINES DISEASED** (J. H.).—In the absence of information as to the condition of the trees and the soil of the border in which it is growing we have some difficulty in arriving at a correct solution of the cause of the disease which has attacked your fruit. The probability is that it arises from an impaired constitution of the tree, and we are led to this supposition because of the small size of the fruit. This want of vigour may have been caused by successive attacks of red spider, which destroy the functions of the leaves. Perhaps you may have observed the leaves looking sickly, and the young wood after the leaves have fallen destitute both of fruit and leaf buds; if so the trees have suffered from this pest. Has the house received sufficient air? These disease spots are often produced by inattention to this. Look to the border and see that the drainage is perfect, and the soil open and porous, with a proper admixture of calcareous matter.

**MELONS NOT SETTING** (W., Herts).—Plants growing in frames placed on manure are not infrequently very vigorous from the roots of the Melons passing through the soil into the rich compost below, and over-luxuriance is not favourable to the setting of the fruit. The only course we can recommend you to pursue is to remove some of the strong growths, so that those remaining are so thinly disposed that the sun can shine on every leaf. Tread the soil very firmly, being very careful not to injure the foliage, and do not give any water for some days, or only just sufficient to prevent the foliage flagging. If the ends of the main shoots are cut off when they reach nearly to the sides of the frame, the axillary growths following will produce pistillate flowers, to which pollen should be applied from the staminate an hour after the frame has been opened in the morning. The fruit-bearing laterals should be pinched at one leaf beyond the flower immediately the latter is seen, and before it expands.

**EDITORIAL NOTICE.**—Our readers can greatly assist in adding interest to the pages of "The Journal" by their kindly contribution of timely notes and notices, and at the present period of the year there may be photographic examples of well-grown fruit, &c., growing or otherwise, that would be worthy of reproduction. The Editor would be pleased to have such subjects for consideration and probable use. He does not guarantee to pay for prints unless by special agreement.

Begins at Onithidium to Phyllocactus.

## Canada, Britain's Granary.

Such are the words emblazoned on the triumphal arch erected by that Colony in Whitehall for the Coronation. That there is much strength in Canada's claim to the title may be readily allowed, but if we include future possibilities it should be well-nigh unassailable. Unlike so many other new fields of culture, there is neither lack of water nor of drainage, the chief and only drawback being the long and severe winter. That frost is not the worst enemy of the agriculturist we most of us know, for in this country the finest crops generally follow the severest winters. No amount of labour can produce such a fine tilth as Nature does by refrigeration.

A copy of a Canadian paper the "Winnepeg Telegram," has recently reached us, and the information contained in its pages is most interesting and valuable. Winnepeg is the capital of Manitoba, and it is only with that province of the Dominion that the journal in question deals; but the

capabilities of Manitoba as a producer of food are so enormous that the remainder of the Dominion seems insignificant by comparison. Manitoba itself, if properly cultivated, might in reality become "England's granary," and now that statesmen are whispering of possibilities of Britain being starved into submission to the foreigner, it is surely not premature to suggest the co-operation of her Colonies in preventing any such humiliation.

The Boer War has done much to foster an Imperial spirit, but the shadow only will have been grasped, and the ripe fruit missed, if Imperial commerce does not follow the flag. The Chancellor of the Exchequer has ventured to place duties on imported grain and feeding stuffs in order to produce a million or two of revenue, whilst at the same time pessimists are looking forward to a period of famine for want of food supplies. If there is any fear of such a famine it would surely pay this country to give preference to Colonial supplies, so as to encourage production under the flag. It is not absolutely impossible for us to produce our own bread, but it is economically so, for we cannot do so except at the sacrifice of other products which are now more largely in favour, and therefore it is fair to suppose more lucrative to the producer.

We have noticed that all proposals in favour of an Imperial Zollverein or Customs Union are severely snubbed by the powers that be. It seems hardly credible that Mr. Chamberlain can acquiesce in import duties on grain and at the same time object to reciprocal tariffs between the Colonies and the Mother Country. It seems to us such a desirable thing from a business point of view that the Empire should be self-supporting if Great Britain cannot be. To show what might be done by preferential tariffs in promoting grain production in Canada, we will quote a few statistics from the "Winnipeg Telegram." The area available for farming in Manitoba is twenty-five millions of acres, of which not quite three millions are now under cultivation. The soil is of very uniform character, and will grow both Barley and Oats as well as Wheat. The average production of Wheat during the last ten years has been 19,928 bushels, or nearly twenty bushels per acre; whilst in 1901 the average was twenty-five bushels per acre, or very little below our British average. This amply shows that under good and regular cultivation the land would be most productive, for the United States' average for ten years was less than fourteen bushels per acre—not much more than half the Manitoba crop of 1901.

The "Telegram" gives an estimate of the cost of growing Manitoban Wheat as follows:—

|  | Dollars. |
|--|----------|
| Ploughing once ... ..                      | 1.25     |
| Farrowing twice ... ..                     | 0.20     |
| Cultivating twice ... ..                   | 0.40     |
| Seed ... ..                                | 0.75     |
| Drilling... ..                             | 0.22     |
| Binding... ..                              | 0.33     |
| Twine ... ..                               | 0.20     |
| Stooking ... ..                            | 0.16     |

| Threshing ... ..                           | 1.46     |
| Teaming for market ... ..                  | 0.29     |
| Two years' rent or interest on land ... .. | 1.80     |
| Wear and tear of implements ... ..         | 0.20     |

7.87 dollars.

A dollar is equal to 4s. 2d.

This was the cost of growing an acre of Wheat at the Government experimental farm at Brandon. The result was a crop of twenty-nine bushels per acre, which, at fifty cents per bushel, realised \$14.50, and left a profit of \$6.63, or, in English money, 27s. 8d. per acre. If, however, we take the average of the 1901 crop, viz., twenty-five bushels at fifty cents equals \$12.50, the profit would have been only \$4.63, or 19s. 6d. per acre. If we go still further back, and take the average of the last ten years, twenty bushels, at fifty cents, we get \$10 gross, and but \$2.13 profit, which is somewhere about 8s. 10½d. per acre. In any case, there would appear to be a fair profit for cultivation as things are now, and a very little preferential encouragement would lead to very extended cultivation of the twenty-two millions of acres which are still growing prairie grass.

Oats, on an average of years, have yielded thirty-four bushels per acre, and in 1891 they reached forty-eight bushels. Barley has averaged 26.54 bushels per acre, and has reached as much as 36.69, whilst in most seasons it is

of fine colour and good malting quality. The farmers of Manitoba find that mixed farming pays better than Wheat growing pure and simple, and they are largely increasing their herds for dairy purposes, the production of butter and cheese being highly profitable; whilst the encouragement thus given to cattle breeding must largely result in increased production of store cattle as well as beef. In view of graziers' difficulties in obtaining store cattle in this country, surely under suitable restrictions we might allow our Canadian cousins an entry into our store stock markets. Let them show us a clean bill of health, and we in return for similar freedom of their markets, should give them entrance into ours.

Other crops may be grown, but the above are those which concern us most. As we must have supplies of Wheat, Barley, Oats, &c., which we cannot grow, and also butter and cheese, which we might grow but do not, why not let our Colonies have the first refusal of our market? If we are to have import taxes on food let us give our Colonial brothers a rebate, and so encourage that most stable of influences, commercial interest.

### Work on the Home Farm.

The sad illness of His Majesty the King threw a great damper on the spirit of rejoicing in our rural districts. The teas, &c., were proceeded with, but in a half-hearted way.

A week of fine hot weather has been grand for the crops. It has stiffened the growth wonderfully, and there are now few symptoms of over-sappiness. The sudden change has made us very busy, for work amongst roots would not hide delay. The land left to itself would soon have been like a brick, so the Mangold and Turnips are being all scuffled over, and a few of the Potatoes treated in the same manner. Some of these which had been hilled up when hardly dry enough would have set very tight. We have scuffled them down, and shall earth them up again at once with the light earthing plough and one horse. It would not do to take two horses amongst such big haulm. Turnips generally look well, and there is little or no fly. The earlier Swedes are ready to thin out, and that will be the next work.

The hot weather has matured the Clover crops, and we shall at once commence cutting and make hay while the sun shines. We have seen a field cut, but the crop did not look heavy.

Potato spraying must be done at once now if it is to be done at all, but it has been almost discontinued in these parts. Two years ago, when there was disease, the spraying was inoperative through the action of heavy thunder showers quickly following the spraying process. Last year there was little disease and practically little benefit to gain. So farmers who are hard of belief in the efficacy of new systems have soon lost the little faith they had. A really bad disease year would do much to reconvert them. If a field or a portion of one only were sprayed this year it would be useful as an experiment, and it is not yet too late.

There is plenty of grass for all stock, but not much to spare in many of the sheep pastures. Some of these thinly planted seed fields might easily be spared, for they are not carrying much stock, and if ploughed up at once they might bring a nice crop of white Turnips for spring use. If left as they are a while longer and ploughed for Wheat a good seed bed might be had, but a good manuring would need to be ploughed in, for there is little in the way of Clover root to stimulate a Wheat crop, whilst when seeds have been poor there is generally a good supply of twitch.

### Utilising Waste Products.

The discovery (says the "Morning Post") of valuable uses for what were at one time regarded as waste products has been one of the most interesting features in the scientific and experimental progress of the past quarter of a century. According to a statement in the May circular issued by the West India Committee another discovery of this description has been made which promises to solve a problem that has long been vexing the sugar planters. The advantageous disposal of the centrifugal molasses has puzzled the sugar planters for many years, but it is believed that a process has been found whereby this and megass mixed can be profitably utilised as a food for cattle. The new food has been named "molascuit," and is believed to be worth £6 to £7 per ton, its local realising value being already £5 to £6. The mixture consists of 20 per cent. of fine and absolutely dry cellular fibre of the Sugar Cane, and 80 per cent. of molasses—in fact, the original juice in the cane is replaced by the molasses. It is claimed that a great advantage of the process lies in the fact that this cattle food can be shipped in bags and in a condition that commends its use to the British agriculturist. The discovery may be of considerable importance to stockowners in this country, who have to obtain so large a proportion of their supplies from abroad, and a properly planned experiment with it would be followed with widespread interest.

## SELECTIONS OF CHOICE & LOVELY PLANTS

BELOW we note a few selections of plants from our glass-houses. All are in the best possible health, and the choice of variety is on the most liberal scale.

**Cacti**, 6 distinct and desirable sorts .. 9/- and 12/-  
**Caladiums**, 12 superb varieties .. 12/-, 18/-, and 30/-  
**Cannas**, 12 gorgeous varieties .. 9/-, 12/-, and 18/-  
**Carnations (Tree)**, 12 choice varieties .. 7/6 to 21/-  
**Coleus**, 12 pretty and ornamental varieties .. 4/-  
**Crotons**, 12 superb and choice sorts .. 24/- to 30/-  
**Epiphyllums**, 12 select sorts .. 15/-, 18/-, and 24/-  
**Fuchsias**, 12 choice and lovely sorts .. 3/-  
**Geraniums, Zonal**, 12 superb sorts, 4/-, 6/-, and 9/-  
**Double**, 12 superb sorts .. 4/-, 6/-, and 9/-  
**Ivy Leaf**, 12 superb varieties .. 3/6  
**Scented-leaved**, 6 varieties .. 2/6  
**Gloxinias**, 12 grand varieties .. 9/- to 24/-  
**Palms**, 12 in 6 choice varieties .. 9/- to 30/-  
**Pelargoniums, Show**, 12 grand sorts 9/- to 18/-  
**Salvias**, 12 in 6 varieties .. 3/6  
**Table Plants**, 6 to 12 varieties, 24/-, 30/-, 42/-, & 60/-

A COMPLETE LIST OF  
INDOOR AND OUTDOOR PLANTS  
IS CONTAINED IN OUR CATALOGUE.

**CLIBRANS ALTRINCHAM  
MANCHESTER**

## Grand New Climbing Rose DOROTHY PERKINS.

The Floral Committee were unanimous in giving this an AWARD OF MERIT when shown by me at the Royal Horticultural Society's Meeting at the Drill Hall, on May 20th.

See Report in this Paper of May 22nd.

This beautiful novelty is a hybrid between Rose Wichuriana and Madame Gabriel Luizet; the flowers are produced in large clusters of a lovely shell-pink with white centre. Besides being a good climber, it can be grown as a fine pot plant.

Orders booked now for autumn delivery, which will be executed in strict rotation. Good plants in 48-pots, 3/6 each; extra strong, in 24's, 5/6 each.

Special List of other New Roses on application.

**E. POTTEN,**  
Camden Nurseries, CRANBROOK, KENT

## RIVERS' FRUIT TREES, Roses, Vines, FIGS, ORANGES, AND Orchard-House Trees.

A LARGE AND SELECT STOCK  
ALWAYS ON VIEW.

ILLUSTRATED AND DESCRIPTIVE CATALOGUE,  
Post Free, 3d.

**THOMAS RIVERS & SON,**  
SAWBRIDGEWORTH, HERTS.  
BARLOW STATION, G.E.R.

## Roses GREAT SHOW

OF THE  
NATIONAL FLOWER  
BY

**Roses WM. PAUL & SON,**  
OF WALTHAM CROSS,

(Rose Growers by Appointment to  
H.M. THE KING),

AT THE

**Roses Royal Botanic Society's Gardens,**  
REGENT'S PARK,

DAILY, from JULY 16th to 20th.

**Roses** Many thousands of Roses, growing and cut, elegantly and artistically arranged in a Large Tent in the midst of the most beautiful Gardens in London.

**Roses** ADMISSION.—WEDNESDAY, JULY 16th, from 2 to 6 p.m. (Band of the 1st Life Guards), 2/6; from 7.30 to 11 p.m. (Illuminated Gardens and Band), 2/6. THURSDAY, FRIDAY, and SATURDAY, JULY 17th, 18th, and 19th, from 9 a.m., 1/- SUNDAY, JULY 20th, by Fellows' orders only.

**Roses** NOTE.—The Roses at the Waltham Cross Nurseries, are On View Daily (Sundays excepted); admittance free on presentation of address-card. Twelve miles from London, close to Waltham Cross and Theobald's Grove Stations, G.E.R.; frequent trains from Liverpool Street Station

## HARDY WATER LILIES AND OTHER AQUATIC PLANTS.

Great Speciality.—New and Old beautiful varieties delivered by Parcel Post during the Spring and the Summer, which are the best seasons for planting them.

**B. LATOUR MARLIAC, Nurseryman,**  
TEMPLE - SUR - LOT (Lot-et-Garonne), FRANCE  
Lowest Prices. Catalogue free on application.

## BEGONIAS. GOLD MEDAL COLLECTION!

Four Gold Medals and Four First Prizes in 1901.  
THE BEST COLLECTION. SEE OUR CATALOGUE.

**B. R. DAVIS & SONS,**  
Yeovil Nurseries, YEOVIL, SOMERSET.

**CUTHBERTS' SPECIALITE MUSHROOM SPAWN.** New Spawn now ready. We continue to receive the most gratifying testimonials as to the productiveness and good quality of our Spawn. Per bushel, 5/-. — R. & G. CUTHBERT, Seed and Bulb Merchants, Southgate, Middlesex.

**PURE WOOD CHARCOAL**, Specially Prepared for Horticultural use. Extract from the *Journal of Horticulture*: "Charcoal is invaluable as a manurial agent; each little piece is a pantry full of the good things of this life. There is no cultivated plant which is not benefited by having Charcoal applied to the soil in which it is rooted." Apply for Pamphlet and prices to the Manufacturers—**HIRST, BROOKE & HIRST, Ltd., Leeds.**

**RICK COVERS** (quite new, all sizes), 6 by 6 yards, 21/-; 7 by 6 yards, £14/6; 8 by 8 yards, £17/4; 10 by 10 yards, £21/8/4, or any size to order at 7d. per square yard; good hemp rope fitted, great quantity in stock, ready to be despatched on receipt of order; carriage paid.—From **H. J. GASSON**, Government Contractor, Rye.

**THE ROYAL PARKS AND GARDENS OF LONDON.**—Their History and Mode of Embellishment. With numerous Engravings, and a series of Designs of Flower Beds and Borders, with examples of Planting them effectively according to the several styles known as Carpet, Geometrical, and Sub-tropical Bedding, besides Notes on the Propagation and Culture of the Plants employed. By **NATHAN COLE**. Price 2/6, post free.—**JOURNAL OF HORTICULTURE OFFICE**, 12, Mitre Court Chambers, Fleet Street, London, E.C.

**FORMICACIDE ANT DESTROYER** effectually destroys Ants in Greenhouses and elsewhere. Sold in bottles, 1/-, 1/6, and 4/-.—**CORRY & CO. (Limited)**, Finsbury Street, London. To be obtained of all Seedsmen.

## Journal of Horticulture.

THURSDAY, JULY 10, 1902.

## Crossing among Cabbages.

HERE is a desire on the part of many growers to save their own seeds of certain kinds of vegetables, such thoughts being inspired when, among a plantation, there appears an unusually good form of either Cabbage, Broccoli, Cauliflower, Savoy, or other kitchen garden plant. It may be distinguished as being early or late, good in colour, well shaped, or, in the case of Broccoli, perfectly protected, wherein is found the ideal of one's aspirations. Whatever may be the distinguishing mark which stands out so conspicuously, leading the owner into a vein of prospective gain in quality or value, all hopes and gains may be shattered if, when the flowering stage is reached, no provision is made against insect interference. Bees are great factors in the shattering of prospects and the mixing of kinds in the vegetable world, for, in their search after pollen grains, they may, and do, invade large tracts of land, where there may happen to be isolated plants, perhaps left for seed, or breadths of flowering Brassicas awaiting the gardener's opportunity to remove them. In such cases the owner of the fostered seed-plant runs great risks of losing his anticipated ideals if he allows the flowering stage to progress without applying muslin or bee-proof tiffany to divert the agency of bees and other insects from mixing the pollen grains.

Lessons such as these come from acquired experience, and in these matters the old adage finds truthful expression, "Experience bought is better than experience taught," for once such facts become realised, they make a lasting imprint on the memory. This happened with the writer a few years since, when, possessed of a particularly good stock of late spring Broccoli, the idea of

READERS are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

perpetuating it for future use, some selected plants were left for seed. Precaution was taken that no other of the Cabbage kind was in flower at the same time in the garden, which was made easy, because the Broccoli selected was of the latest kind, and no necessity existed for having others about. This protection, however, did not prove sufficient, for plants raised from these chosen seeds developed every good hope until near their time of maturity, when it was discovered they were an entirely new order of vegetation, but without a value. In other words, they furnished neither a Broccoli nor a Cabbage, though they resembled the latter the most up to a period when they should at least have been useful. The growth of a planting of these for late use must, even in a large garden, inflict loss, disappointment, and probably a break in the succession at a most important period of the year. The loss was the greater because the whole was of the same useless character, and the resolution of the time found expression in the abandonment of home saved seed stocks.

Time, however, works many changes, both of will and purpose, and the retrospect bring into light the folly of self-confidence in the "natural order." Probably, had these isolated plants been perfectly guarded by a tiffany case, the ideals so well cherished would have found fresh channels and good resolutions have remained sound.

The record of such failures may at the present time, when some among your many readers are bent on similar gains, be a useful reminder of the improbable, and those who may already have plants in an advanced stage of seed growth will see the unwisdom of placing any confidence in the venture, if neglect of this item of routine has been allowed, that is, in districts in which bees, domestic or wild, abound.

One's own garden may be free from foreign stocks, but others may not be, and the distance covered by bees cannot be easily estimated from which they may carry infection. To the fruit grower in spring time bees are welcome aids to the successful fructification of the varied kinds in flower time, and to the vegetable gardener no inconvenience arises except in an instance where a pure stock is sought and required.—W. S.

## The Value of Apples.

His Majesty the King has been advised by his medical men to partake of English Apples. No Apples taste so well to Englishmen as those grown within the United Kingdom, and the fact that the highest medical doctors have ordered them at this time of the year from a Herefordshire grower would emphatically suggest that home-grown Apples contain something which the best of foreign ones lack. The variety sent to Buckingham Palace for the use of the Royal patient was reported to be Dumelow's Seedling, better known as the Wellington Apple.

In Albert Broadbent's little book, entitled "Fruits, Nuts, and Vegetables" (6d. net, Manchester), we find it stated that "the composition of the Apple consists of much water, vegetable fibre, albumen, sugar, gum, chlorophyll, malic acid, and lime. Eaten uncooked and well masticated, it is easily digested. German food-chemists state that the Apple contains a larger quantity of phosphates than any other vegetable or fruit. The Scandinavians called it the 'Food of the Gods,' and believed it possessed virtue to renew both mind and body. With rare exceptions, Apples are good for those disposed to gout and sluggish liver, and those who follow a sedentary life. Two or three eaten at night—uncooked or baked—correct constipation. I know several cases that I had under my personal observation in which baked or roasted Apples, eaten with brown bread toasted and buttered cold, were enjoyed and digested when all other food gave great pain, and thus prepared the way for ultimate recovery. It should not, however, be assumed that baked Apples will cure every dyspepsia. Rotten Apples used as a poultice is an old Lincolnshire remedy for sore eyes. The juice of Apples without sugar will often reduce acidity of the stomach, becoming changed into alkaline carbonates, and thus correcting sour fermentation. It is stated on medical authority that in countries where unsweetened cider is used as a common beverage, stone or calculus is unknown; and a series of inquiries made of doctors in Normandy, where cider is the principal drink, brought to light the fact that not a single case of stone had been met with during forty years. The Normans introduced cider Apples into Hereford, and any chance case of stone if found in a Devonshire or Herefordshire hospital is regarded by the doctors as a sort of professional curiosity imported from a distance. It may, therefore, be fairly surmised that the habitual use of natural unsweetened cider keeps in solution matter which is otherwise liable to be separated in a solid form by the kidneys. How much better the fresh ripe fruit may be."

## Seasonable Hints on Vines.

During a season like the present, when a long period of cold, wet, sunless weather is suddenly followed by bright, hot days, the Grape grower has to be on the alert to prevent the scalding of both leaves and berries, and by good management generally to get full benefit from the present favourable climatic conditions. At one time it was usual for writers to denounce in the strongest possible terms the practice of shading vineries under any condition, and although shading is not generally to be commended, there are circumstances under which I have proved over and over again the wisdom of doing so. Those who have houses with metal roofs know too well how greatly Vines grown in them show signs of distress when the sudden changes already referred to occur, and if a light shade is then applied to the roof the Vines at once feel relief, and are thus able to perform their functions the better.

In modern houses constructed by wood and glass the panes are generally very large, and should the Vines happen to be trained within 15in or 18in of the glass they suffer considerably during bright bursts of sunshine, and are benefited by a slight shade. Finely powdered lime, or whitening mixed with milk, forms a suitable shading compound, which is generally ready at hand and can be quickly applied with a syringe. The important point is to give a very light coating at the first application, as it is easy to add more if bright weather continues, but not easy to remove the surplus if too much is given.

Again, it is almost impossible to retain for long, without shading, the colour of Black Hamburgh Grapes, which are ripe at this season, and in such instances a much heavier shade may with advantage be given. This, of course, is to be removed as soon as the Grapes have been cut.

Many cultivators of Gros Colman seem quite unable to keep the leaves fresh and healthy-looking till the Grapes are ripe, and I quite expect to hear many complaints about the leaves turning brown and "cupping" after the sudden atmospheric changes recently experienced. I think I can give a few hints about this matter which may be of service to many. The leaves in the early stages being extremely tender cannot endure rapid evaporation without injury, and anything which tends to lessen evaporation helps to preserve their freshness. When hot weather sets in it is usual to greatly increase the amount of air given at the bottom or side of a vinery, and when this is done in houses where Gros Colman is grown the leaves begin to assume that undesirable brownish tint and their edges turn upwards.

Very little, if any, bottom air should be given to this variety until the Grapes begin to colour. Instead, a slight shade should be applied to the roof when hot weather sets in, and top ventilation given very early and increased gradually; then, with due attention to watering, feeding, and damping, this fine Grape should be grown to perfection. I have never known the berries to become really black when the foliage has been badly discoloured.

With all varieties it will be necessary to keep a sharp look out for red spider, and the eye which detects the beginning of an attack while it is confined to a few leaves may often be the means of preventing much subsequent trouble if such leaves are thoroughly sponged with an insecticide at once. Sometimes this troublesome pest seems to attack one or two Vines in a house suddenly, and I have then often been able to get rid of it entirely by syringing the foliage heavily a few times.

At one time I was afraid to either practise or recommend syringing Vines for fear of disfiguring the Grapes, but some years ago I became convinced that if clean soft water were used the operation could be performed without the slightest injury to the bloom or the berries, and I have syringed after the Grapes have begun to colour. In order to be effectual the water must be forced sharply on to the under side of the foliage; then, as it falls, it will not disfigure the Grapes. It is only when the operator fails to aim straight, and catches the bunch, with the water direct from the syringe, that damage is done.

In the case of a bad attack which is general throughout the house a strong fumigating with XL All on two successive nights will usually kill every red spider present. I have found this method perfectly effectual with Black Hamburgh Grapes, but it is seldom safe to fumigate Muscats, Lady Downe's, or any of the thick-leaved kinds sufficiently strongly to kill the insect without injuring the foliage. In one instance, however, I fumigated a house in which there were two Muscat Vines. Yet, strange to say, they were quite uninjured, although the insects were effectually killed.

In conjunction with the above practice for getting rid of insects, steps should be taken to keep the roots active by due attention to watering and feeding, as, without active roots, insects will become troublesome again and again, and it is for this reason that I have frequently recommended, and now reiterate, "always allow a little lateral growth to be constantly going on," in preference to removing every young shoot on a Vine when stopping is being done.—H. D.

**Lælio-Cattleya × Nysa.**

This splendid acquisition has been shown by the raisers, Messrs. James Veitch and Sons, Limited, Chelsea, for a number of years now, and its merits are more than ever appreciated. The plants are of robust habit, with stems 6 inches long, and stiffish leathery leaves, almost as long again as the stems. The parents were *Lælia crispa* and *Cattleya Warscewiczii* (*C. gigas*), and the flowers approach in form, size, and colour those of the cross *C. × exoniensis*.

The sepals and petals are soft lilac-pink, the side lobes of the lip being yellow externally, and have a deep purple blotch at the apex on the inner side. The front lobe is rich crimson purple, shaded with maroon, and with a paler, crisped edge. It received an Award of Merit from the Royal Horticultural Society.

**The Week's Cultural Notes.**

Most of the stems of *Thunia Marshalliana* and similar sorts that are going to flower this year will have done so by now, and it is no use keeping them any longer in heat, the flowerless stems elongating unnecessarily. They should go at once into a sunny and comparatively dry house, and water at the roots must be gradually withheld as the foliage ripens and falls. In winter these plants are absolutely dormant, and if room is scarce they may be turned out of the pots, the most of the dead roots cut off, and the stems tied up in bundles. They may then be suspended in any warm, dry house or shed, where the temperature in winter does not fall below 50deg.

*Calanthes* are growing now very freely, and must be seen to in the matter of room, so that every portion of leaf gets its full share of light. As a rule the plants will need moving, say once a fortnight, this preventing overlapping of the leaves, and consequent damping. The roots are very active, and must be afforded copious supplies of water. In some cases, where grown in small pots, a little manure water may be necessary, but it is easily overdone, and the large plethoric pseudo-bulbs obtained by liberal feeding do not as a rule flower any more freely than smaller, well ripened specimens. The former, too, are more likely to be attacked by spot, that inveterate foe to *Calanthes*.

That lovely Orchid *Miltonia vexillaria* will soon have finished its growth, many plants having already done so. This will mean a slight slackening of the root moisture, but nothing like a dry regime must be practised or the result will be apparent in

shrivelled growths. But this is, perhaps, the quietest season for them, and may be taken advantage of for a thorough overhauling and cleaning. Thrips are very apt to attack this beautiful species, and careful sponging and dipping in tobacco water and soft soap are to be recommended whether insects are visible or not.

Plants of *Lælia purpurata* that have flowered should be assisted by ample root moisture to finish up their growth where this is not quite done. Where the pseudo-bulbs are complete endeavour to keep the plants quite dormant by giving plenty of air and light and not pushing the heat unduly. Plants that are growing sluggishly all through the winter never flower freely or well, but those on the other hand that are kept dormant grow and eventually flower much more strongly for it.—H. R. R.

**Two Cypripediums.**

*Cypripedium Svend Brun*, which is a cross between *Lowi* and *Curtisi*, is of recent introduction. The petals and pouch are a

most intense wine colour, the former beautifully spotted with dark brown. The dorsal sepal is very much like that of *Curtisi*. The leaves are leathery and slightly tessellated. *Cypripedium Lebaudy-anum* is one of the finest of this interesting genus, and was raised in the collection of Robert Lebaudy, of Bougival, Belgium. The seed was sown in 1890, and the first flower appeared in 1895. It is a cross between *Hayaldyanum* and *Philippinense*. While both of its parents are of extremely slow growth their progeny develops much more rapidly, the growths usually being completed within a year and flowering freely. I have flowered this plant, writes J. E. Rothwell in "American Gardening," each year for the past three years, and the new growth now developing seems to be the strongest it has

**Lælio-Cattleya × Nysa.**

ever had. The peduncle, usually about 2ft in length, generally bears four flowers, although sometimes it carries five. The blooms are almost exactly intermediate between these parents, and are larger than either. Pouch is a beautiful soft yellow, the sepal white and pale green, with stripes and spots of crimson, and the mauve-tipped petals are also beautifully spotted. The flowers last a long time, all remaining perfect for about six weeks. Altogether it is a thoroughly first-class *Cypripedium*.

**The Persian Lilac.**

In fragrance and general beauty the Persian Lilac may be considered the equal of the ordinary garden varieties; but it is not so well adapted for cut-flower purposes—one of the chief charms of the old-fashioned Lilac. Cut and placed promptly in water, the Persians last but a short time. The white Persian Lilac is not considered as pretty as the purple. Occasionally it runs back to the purple. Both make handsome, symmetrical bushes, and are very floriferous.

## The Horticultural Hall.

The Royal Horticultural Society's Temple Show and great exhibition at Holland House, having now passed, the Council have formally made an appeal to the 6,000 Fellows of the Society on behalf of a fund to meet the coming expenses in the erection of a hall for the fortnightly shows and committee meetings. It is unnecessary at this period of the Society's history to recapitulate all that has been said in favour of the provision of a hall—a home—for the mother society, the predominant centre of British horticulture. Those who regularly attend the present Drill Hall at Buckingham Gate are well aware that it has many failings. It is frequently too limited in space for the groups and tables of exhibits, it is badly lighted, noisy, cold, and draughty in spring and winter, and unbearably overcrowded by visitors during the earlier summer months.

The patrons of horticulture who so largely attend the Drill Hall meetings certainly do not enjoy the jostling (which is inevitable at present) any more than we do, and it is for these powerful reasons and others that could be given that a general subscription on behalf of an imperative object is necessary. It is hoped that the Council's appeal will meet with the heartiest support, and judging from what has already been promised, and from the resources yet to be drawn upon, we have not the slightest doubt, and never have had, but that finances will be equivalent to the Council's requirements.

From £25,000 to £30,000 is expected, and it is for the Council to see that no more than the higher sum will be spent altogether on the hall. The amount is quite sufficient for the building of a spacious and perfectly suitable hall. The sum already contributed before solicitations have been made amounts to over £13,000, which prognosticates well.

## Improvements in Hardy Plants.

(Continued from page 7.)

I will now hastily run through some of the most important families that I think should be dealt with, and the first on the list will be the

Aster, the capabilities of which are endless, and I believe before many years they will become one of our most popular families and be grown by millions, both in pots and in the open. In a very short time we shall have as many pinks and reds as we have blues and whites, and Perry's Pink, one of the *lævis* section, is a fine one to work from the colour being a good bright pink and the first of this section of a good colour. It is a seedling raised from Miss Stafford, a Winchmore Hill Variety. Great care must be exercised in raising Asters to keep to the stick-at-home varieties. Do not touch those that run all over the border. A favourite group of mine is the *cordifolius* section, forming sheaves of the most graceful flowers, and favourites with everyone for cutting. I find this group is far better grown in partial shade. The *Amellus* group will take a first place for pots, their natural habit lending themselves to this mode of treatment. The flowers are large and of every shade, from the richest violet imaginable to very pale blues. The white we have is of no use horticulturally, but what the progeny will be I do not know. In Perry's Favourite we have the first good pink in the *Amellus* section, and one that must become popular. There is no question that from this may be obtained varieties brighter in colour and invaluable in every way. A good type of Aster to work from is Esme, a seedling of the Rev. Wolley Dod, 3ft high, with a large spreading head, pure white, and remarkable for lasting a very long time in bloom. One can imagine what a double white of this description would be worth, and it is coming. We have already semi-doubles, and one fully two-thirds double, and I am looking forward to the coming season for many others of this character. A race of good double Asters will be a grand addition to our list of decorative plants and also for pots, and it is only a question of time to obtain them.

*Anemone japonica* is in very successful hands, and great improvements have taken place, and many more to follow. Queen Charlotte, Mont Rose, and *Rosea superba* are grand. I should like to see the Parsley-leaved variety taken in hand. The foliage is wonderfully effective, but the flowers very poor.

*Agrostemma flos-Jovis* is capable of great improvement. It is a good all-round plant for cutting or decoration, and there is no reason why we should not get a double. There used to be a large double variety of *A. coronaria* thirty years ago, which I believe is now lost.

The common white *Arabis* has made a great bid for popularity. The double form is splendid for cutting, lasting well into summer. We have several species with rose and pink flowers. Why cannot we get this colour into the double one?

*Asphodels* form a very characteristic group, and I think the

Asiatic and European species might be brought together with very good results.

*Aconitums* offer many opportunities for improvement. A good yellow *A. japonicum* or even a yellow *A. napellus* would be a great acquisition. Do you think it possible to obtain them? I say yes.

The capabilities of the *Aubrietia* have been fairly tested, and we have now a good range of colour, but there is no reason why they cannot be still improved both in size and colour.

The *Calystegia*, I believe, is capable of a great transformation, and I see no reason why flowers of immense size and of almost every shade of colour cannot be obtained in the perennial varieties. If the annual varieties would not produce these results, we might seek the assistance of its American ally, the *Ipomæa*.

*Campanulas*.—We all know their capabilities, and there is not a single species in the whole race that cannot be improved. As a rule the great bulk are raised from seed, no attempt being made either to discard the bad forms or to retain the good ones, and many are becoming so poor as to be not worth growing. A few good hybrids we have, Van Houtte, G. F. Wilson, and Hendersoni being still among the best. I should like to see this family taken up by two or three enthusiasts, as they are so easily done, requiring little attention and the results quickly seen.

*Cheiranthus alpinus*, the Alpine Wallflower, would well repay a little attention. Crimson, red and yellow varieties would be very effective, and I think can be obtained.

*Chrysanthemum maximum* has shown a remarkable development, and some of the flowers are really superb. For decoration or for cutting they are matchless, and still I believe can be much improved. Some of the more recent seedlings have shown distinct signs of doubling, and I shall not be surprised any day to hear of one being raised. I have just read that American seedlings are showing signs of colouring, but I am doubtful about it.

The Shasta Daisy, which has been sent to us from the other side of the Atlantic, is described as being a marvellous production, but whether the plates are overdrawn or not, I cannot see that it will bear any comparison with what we have already got. I like the name Shasta Daisy and shall certainly use it.

*Coreopsis lanceolata* I think would pay well for a little attention, seeing we have some perennial species with rose coloured flowers, which we could fall back upon, providing the annual ones could not be induced to assist us in obtaining different shades from those already in cultivation. A red or rose coloured variety of *Coreopsis lanceolata* would find many admirers; a great deal might be done in selection, as I do not consider the present one anything like so good as the one I knew twenty years ago.

*Echinacea purpurea* has degenerated considerably during the last twenty years, and many of the strains now offered are not worth growing, whilst the good ones are among the best of our autumn perennials. The colour is being improved upon each year, and reds and purples will soon take the place of the poor varieties so often seen.

The *Erigeron* contains some good material for further developments, and in *E. speciosus* we have a very useful plant for all purposes and a great favourite, as it lasts so long in bloom. Among the perennial species we have white, orange, and flesh, and among the annual varieties yellows. Transfer either of these shades to the *speciosus*, and the result would be very pleasing. I find the "*compositæ*" as a rule, especially after the first break, very easy to cross.

*Eremurus*, white, lemon, and apricot varieties of *robustus* are in existence, and many other shades of colour will, no doubt, follow, but a man wants to start very young if he wishes to see the result of his labour in hybridising this family.

The species of *Geraniums* are, as a rule, somewhat weedy, but there are some among them remarkably showy, and could very easily be improved upon. The white variety of *G. sanguineum* is one of the very few varieties we have in this family.

The *Geums* are somewhat important, as they last a long time in bloom, are easily grown and very variable. There are now several good varieties of *Heldreichi*, *montanum*, and *coccineum plenum*, but these can be improved upon very considerably.

*Gypsophila paniculata*, the double variety which was shown before the Royal Horticultural Society during the past season, I think will become a very good plant, providing it can be propagated, but I have never been very successful in propagating this by cuttings, and I am somewhat afraid of the double.

In the *Heleniums* we have two or three good varieties, the best of all without a question is *H. pumilum magnificum*, and this, I consider, is one of the best twelve hardy perennials in cultivation. It is in flower well for at least four months, and during the drought of the past season was a mass of flower. *H. striatum* is a plant that will well repay a little attention, and I can see no reason why a crimson could not be obtained with care by selection. I have raised many, all striped more or less, but no self-coloured flowers.

*Helianthus* has been worked upon for some years past, and the new *Helianthus tomentosus* (certificated under the name of *mollis*) is excellent for crossing purposes. It is certainly the most

\* Improvements in Hardy Plants, a paper read by Mr. Amos Perry, of Winchmore Hill, London, N., before the Horticultural Club.

characteristic in the family, distinct in foliage and formation from any of the others, and one that does not run about.

*Heliopsis lævis* is still capable of further improvement. The colour is unique at that season of the year, and for cutting invaluable, but it is not a good habit. A variety 2ft or 3ft high covered with rich orange flowers would find many admirers.

The Oriental Christmas Roses are very useful, but I do not think can be much improved upon; they are no good for cutting, and never will be, but in a shrubby border they are very useful.

It is possible to get some fine varieties of *Hemerocallis*, but they will have to be remarkably distinct to find favour with the public. Commercially there is not much value in them, I suppose from the fact that they cannot be killed.

(To be concluded.)

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### Rochfords, Turnford Hall Nurseries.

Nowhere in England is there such an extensive market nursery as that of Messrs. Rochford and Sons, Limited, at Turnford Hall, near Broxbourne, in Hertfordshire. The station at Broxbourne is reached in forty minutes by rail from Liverpool Street Station by the Great Eastern Railway Company. And when one has stepped out at Broxbourne after having studied the mile upon mile of flat and low-lying country, much of it flooded in rainy weather, the visitor discovers that he has to walk back almost in line with the railway for a distance of over two miles in order to enter the Rochford's establishment. On a pleasant day the walk is exceedingly enjoyable, passing as it does by a deep canal with grass-shorn sides and onward to the highway leading past Turnford Hall. The canal referred to is kept under constant close supervision by men whose duty it is to repair and dress the sides. In mowing the grass upon the banks they evidently do not try to secure all of the mowings, judging from the large quantities seen floating down stream.

An impression of the extraordinary acreage and extensiveness of the business is obtained as one flies past in the train either going from or to London, and having spent two or three hours inspecting the glass ranges, one cannot find words more satisfactory in describing the place than to say that it is a wonderful concern.

Calling at the office, where half a dozen clerks, under a cashier, were busy on their books and correspondence, an office lad was procured as a guide to discover the manager, Mr. Kelsall, whom we found with the foreman.

When it is considered that nearly seventy English acres are practically covered with span-roofed glass houses it will be conceded that we did not attempt to inspect all there was to see. Here we saw a block of houses, each 200ft to 300ft long, and 12ft wide, devoted to Tomatoes; further on a similar set—perhaps half a dozen side by side—would contain the brighter flowering Zonal Pelargoniums for the supply of cut flowers; and so on. The houses run in various directions, and each great section of houses is divided from an opposite section by broad roadways for waggon and other traffic. In order to have a thoroughly efficient heating system stock-holes and boilers are built in line at short intervals apart. Each boiler heats perhaps a dozen houses. Dotted over a great area I counted two score of chimney stacks, built square with bricks, and each about 20ft high. The houses, as I have stated, are span-roofed, and joined on either side by a flat gutter 1ft broad. The top ventilators are worked by a lever from one of the outside ends.

The Tomatoes are grown in 8in pots, and succeeding them were the Zonals, one of the best among which was Raspail Improved. Begonia Gloire de Lorraine had gone past for the year, but its handsome white sport named Turnford Hall, and raised here, was still on view, and I was shown a seed pod on one of the plants. On the opposite section were some of the magnificent vineries, 30ft wide and 300ft long. The pipes are placed a little on either side from the centre, and run at half a foot above the borders. Gros Colman is a market favourite, and filled the houses I refer to. Only young healthy rods are cultivated, and a fresh stock is constantly maintained.

It would be without purpose were I to name all the classes of plants grown, but those cultivated by the thousand and in all sizes including Pandanus (almost milk-white in foliage, secured, it was said, by allowing plenty of light to them and confining the plants so far as practicable in small pots), Kentias, Rhaps, Latanias, Pteris, Adiantums, Asparagus plumosus nanus, and many other Ferns and Palms. Some of the most magnificent Palms were 12ft to 14ft high and in stout tubs. These were priced at thirty guineas apiece.

Other collections embraced *Fittonia argyrea* and *F. gigantea*, whose foliage is used in decorations; also *Cycas revoluta* to supply leaves for wreaths and other floral designs. The demand, however, for *Cycas* leaves has declined somewhat within recent years. I was gratified not less than surprised to learn that the

firm despatch large consignments of Palms to the United States of America, as well as all over the United Kingdom. The merchants in our own islands naturally deal largely with the Rochford firm.

A private service railway is conducted to the side of the nursery, and joins the Great Eastern Railway Company's main line at Broxbourne. There is thus the greatest facility for quick transit.

And since the firm has established a great refrigerator at Turnford Hall, it is enabled to store and supply millions of Lily of the Valley roots, or Liliums, Azaleas, or other subjects at any season of the year. These cold chambers were a source of great interest to me, for while the sun was warm and bright outside the building, every box and board within it was studded with hoar frost and icicles. Being arranged tier upon tier, one over the other, in huge piles, and so fitted that air passes between each, an enormous quantity of stock can be housed. The entrance doors are ponderously constructed and very tight fitting, while the walls, too, are thick and non-conductive to heat. Darkness reigns, and a lamp is necessary when an inspection is made.

At the time of my visit a second boiler for the refrigerator-engine was being added in case any untoward circumstance should disable the original one—a compact marine boiler. The air-compressing engine is 15ft from the boilers.

Reverting to the ranges, the corridor of *Lapageria alba* with spotless waxy flowers depending from the roof, was of wonderful beauty, and opening off on either side were the Orchid houses. It is well known that few collections of *Odontoglossum crispum* equal that of Turnford Hall. From so many thousands there are sure to be some of superior excellence and of distinctive characters. Such is, indeed, the case, and I was privileged to inspect some very prettily-marked and coloured crisps of splendid form and constitution. The houses of *Cattleyas* in varieties and *Cymbidiums* were each of interest and in the pink of condition; but time was too limited to stay—we had to "Move along," as the policemen say. By the way, it is noteworthy that *Lapageria rosea* is not grown, or, if so, it was certainly not conspicuous.

*Hydrangea Hortensia*, with such immense and beautiful heads of deep rose-pink flowers as I have never before seen, came as a revelation of what can be done by good culture. Yet the plants were only in 5in and 6in pots. *Kalanchoe flammea* in another house promised well, and only a day or two ago I was pleased to see this newcomer already in a London West End shop. A specimen plant of *Stephanotis floribunda*, covering fully 180ft in length of wire, in one of the ferneries, was roped with lovely clusters, and well earns its position at Broxbourne. The houses of *Eucharis* gave evidence of the care bestowed. And then, the Roses cultivated on the planted-out system under glass, add another feature, and one which it is hoped will be developed.

Some three hundred men are employed here, and a comfortable institute for the young unmarried men has been provided since 1896. Their meals are provided in the institute, and beyond the privilege of good, well-cooked food at a moderate charge, close to their work, recreation-rooms, and library with books and papers (the gardening journals, of necessity, included) are also attached. And this great business, now a limited liability company, was founded and built up entirely by the efforts of the late Mr. Thomas Rochford, whose lamented and untimely decease at the age of fifty-two occurred in October last.

### Floral Designs.

Although these notes on floral designs as viewed in one or other of the London west-end shops are recognised as being too extravagant to be patterned after literally, yet on a smaller and humbler scale the same general features may be copied, and with this hope I may be allowed to continue the notes from page 12. The best efforts of our London florists are seen during the earlier and middle days of each week. A magnificent wreath, composed of the flowers and trusses of a purplish-mauve variety of Fancy Pelargonium was worthy of special attention. Unfortunately I was unacquainted with the name of the variety whose colours were so pleasing and rich. The framework of the wreath was ensnathed in blooms closely and evenly laid on, there being no Ferns or other greenery employed round the circle. The wreath was suspended, and from the top side, facing the public, a loose arrangement which could not be described as a bouquet, yet which centralised much in the same manner, was fixed, and composed of individual blooms of the Pelargonium wired. At four points beneath this so-called bouquet were streamers fashioned so as to lightly veil the general circle, and, to add to the character of gracefulness, deep in the bouquet part of the wreath I noticed the well-selected leaves of *Caladium argyrites*, each disposed to the best advantage, and not one more than was necessary. On the lower outside fringe of the arrangement two other *Caladium* leaves were used; but these were at least 5in long and proportionately broad, and coloured creamy-white. Flowers of *Cattleya Schröderiana* and sprays of *Odontoglossum crispum* with a little *Asparagus plumosus* completed this excellent floral wreath.

Another object of merit worthy of notice, but which may be beyond the aims of most of my friends to reproduce, was a large floral cushion with concave sides and the corners attenuated to a point. From the sides to the centre the surface swelled evenly, the design being worked with rich rosy-cerise Pelargoniums. Around the edge on all sides were the flowers of Saxifraga sarmentosa, and at that corner which caught most of the view a greater profusion of the Saxifraga was carried forward, and shoots of the Alder, with its dark green leaves, lay beneath the white sprays of this flower. A bouquet arrangement consisting of blush Malmaisons for the underwork and much deeper coloured border Carnation flowers above, was poised about the centre of the cushion, being equally balanced on all sides. A few of the Alder leaves, with their corrugated surface and serrated edges, were used among the Carnations. At the upper left-hand corner from the one I have said was most prominent a large rose-coloured ribbon bow was fixed.—WANDERING WILLIE.

## Practical Entomology at Aldersey.

Tuesday, July 2, was prize-giving day at the Aldersey Grammar School, Bunbury, and the various reports went to show that the reputation of the school for general efficiency has been well maintained during the year. In certain respects the school stands out among the educational institutions of the country, while its remarkable attendance record, and the fact that the boys are so successfully encouraged to study practical entomology and other subjects pertaining to agriculture and Nature, have won for the school a unique and enviable position in the country. It is, moreover, a school with a history, for it was founded by Thomas Aldersey, a citizen and haberdasher of London. An interest has ever been taken in the institution by the Worshipful Company of Haberdashers, the governing body, and that interest was never more generously manifested than it was last week. Mr. O. S. Tudor, who presided, said that the school had lost a valued friend in the death of Miss Ormerod, who for twenty years took a practical and lively interest in the school. She considered the school ahead of all others in the science of entomology, in which she herself was an expert. Mr. Arthur Peell, a member of the Court of the Haberdashers' Company, had promised to give the prizes formerly given by Miss Ormerod.

### A Beneficial Crusade.

The headmaster (Mr. W. Bailey) read an interesting paper relative to the prizes for practical entomology. He alluded at the outset to the passing away of Miss Ormerod, who took an interest in the school for more than twenty years, and whose name he said, would long be a household word in Bunbury. He also made grateful reference to the fact that Mr. Field, a member of the Court of Assistants of the Haberdashers' Company, had voluntarily undertaken to provide the prizes hitherto given by the late Miss Ormerod. (Applause.) He said: "The attention of the boys throughout the school continues, by the desire of the Haberdashers' Company, to those insects which are injurious to cattle, food crops, fruits and forest trees, and to the best methods of prevention and remedy of their attacks. The boys continue their efforts to exterminate the ox warble maggots, which pests give so much needless pain to our fine herds of cattle, and are the cause of such a serious loss to our farmers—estimated by practical men at sums from two million to sevenmillion pounds sterling per annum. During the present half-year the boys have squeezed out 1,066 of these pests. These have been brought to the school on Monday mornings, and counted in the presence of Mr. Bailey or one of the assistant masters. The parish of Bunbury is comparatively free from this pest, but on visiting the outlying districts, on their bicycles, the boys have no difficulty in finding too many of these tormentors of the poor cattle. As to other injurious insects, the boys have brought to the school in the present half-year 16,284. Next month a nature study exhibition will be held in the Royal Botanic Garden, Regent's Park, London, at which not only the United Kingdom, but also the Colonies and the United States will be represented. At the request of the treasurer and secretary (Mr. C. S. Roundell and Mr. J. C. Medd), an exhibit will be sent up from our school, consisting of maps of school district, plans of school and playground, insect cases, breeding cages, diagrams, collections of insects, grasses, weeds and wild flowers, &c."

### Nature Study.

Mr. G. F. Dutton (assistant master) read a paper showing that the subject of nature study now takes a prominent part in the school curriculum. Besides collecting insects, the boys were continually bringing to school some new wild flower or leaf or plant which they had discovered, and of which they were anxious to know the name. Forty-eight boys had competed for Past Master Slater's prizes. They had collected wild flowers and weeds, and dried and mounted them in book form, giving the common name to each specimen. Mr. Dutton also read an equally interesting report on the collection of grasses by the boys, and a further statement on the map drawing.

### The President of the National Rose Society.

In the issue of July 2, the London "Daily Chronicle" contained the following notes which are full of interest to members of the National Rose Society, and to all the friends of the Very Reverend Dean who is so much respected as president, that we quote them in full:—"Dean Hole opens to-day at noon in the Temple Gardens the great Court of the year to her Majesty Queen Rose, the organisation being undertaken by the National Rose Society. The post of president is his by right of having been the first to throw down the gauntlet in honour of the Queen of Flowers. The Dahlia and the Carnation, and even "the vulgar hairy Gooscherry" each displayed themselves at exhibitions. He suggested in 1857 in the pages of the "Florist" that a grand national Rose show should be held. So exuberant was the Dean, then squarson—squire and parson, too—of Caunton, near Newark—at the result of his appeal, that bloodshed was the result—he "whistled in the act of shaving!" Rose lovers subscribed £200, St. James's Hall was engaged for July 1, 1858. Half the nurseries of England sent their treasures; the Rev. S. Reynolds Hole bringing his at daybreak a journey of 120 miles. So successful was the day that each following year has brought its Rose show, and the original 2,000 visitors have grown to tens of thousands.

"Born in 1819, this cheery knight of Queen Rose was educated at Brazenose, Oxford; and a brazen-nose, therefore, affectionately decorates the door of his deanery study. In due time he became curate of Caunton. Lord Salisbury in 1887 appointed him to the Deanery of Rochester, where, in contrast to his predecessor, Dean Liddell, the collaborator in compiling a Greek dictionary, he has devoted himself to other sorts of roots. From the wonderful album which he cherishes with proper care may be seen the portraits and autographs of all his distinguished contemporaries, whom he counted as friends—artists, literary folk, politicians, actors, ecclesiastics, from Dickens to Kipling, a member of the Rose Society, and from John Leech to Sir Frank Burnand. Here you learn that Dean Hole and Thackeray stood back to back, and in the matter of height were declared "a dead heat." Within the deanery, too, may be seen some of Leech's choicest drawings, which illustrated their joint 'Little Tour in Ireland.'"

### The London Rose Shows.

What was the purpose of the recent Conference on Roses held at Holland House? Presumably one of the desires of the promoters was to take note of the progress achieved in crossing and hybridising species and varieties. But even had the season not been dead against success, no effort seemed to have been made to exhibit species as a group by themselves, nor to arrange the newer productions in nearness to each other. When sections and characters are being so quickly broken down by the constant and laudable work of the hybridisers, we do require once and awhile to get back to the starting line, back to the species, for it is only by a study and knowledge of them that recruits to rosarian ranks can hope to understand the composition and development of the beautiful Roses they so patiently cultivate and passionately admire. Not a plant came from the Royal Gardens, Kew, and but for the groups from Paul and Son, and Charles Turner, the exhibition, in line with the Conference, would have been reduced to the blanky lines of show-boxes containing poor blooms, and better work than this is expected from the Royal Horticultural Society.

Two numbers back, in noticing the publication of an essay on "Clouds and Weather Signs," it was remarked that gardeners must be vigilant observers of "the floor of heaven," that they may work their way to success. How necessary it is to be ever watchful, and sometimes daring too, as a rosarian, was revealed on the Monday afternoon before the Temple Rose Show. The sky on that day became black and ominous everywhere, and while exhibitors would gladly have left their blooms until the close of the day, some of them felt that it was courting disaster to chance the storm which appeared imminent. "Make sure," became the words, and it happened that in two cases the last bloom was cut just as the first large raindrops came swiftly down.

The show itself was good to see, and a friend remarked that he could excuse the ecstasy of any Rose lover, and could also understand something of the charm that the cultivation and exhibiting of Roses has upon devotees, after his having gloats over those long lines of beautiful flowers in the leading open classes. But what can we say of the titled lady who replied with scorn, "I hate Roses!" to a gentleman who asked why she had not visited the Rose Show? I can vouch for the truth of the

story, but I cannot satisfactorily explain her perverted judgment and taste.

The coolness of the show day so admirably supported the flowers that Mr. Pemberton, who tried so hard at the last annual general meeting of the society to induce the members to endorse a two days' exhibition, must have felt that his case was now worthy of better consideration, and if he chooses to present a renewed petition he may have many new supporters. This year the two days' Rose show would have been an unqualified success in every direction.

May we expect an imitation "Rose-dell" or great assortment of decorative Roses in the open air another season? Who can describe the charm of a well-arranged open-air collection?—J. H. D.

#### The Philadelphia Rambler Rose.

A new Crimson Rambler Rose (says "Meehans' Monthly") has been sent out under the name of Philadelphia. It is almost identical with its parent, but the flower is slightly improved by being more double. The foliage is claimed to be better and less subject to mildew, but this is something that should be put to stronger test before the assertion has weight. Introduced by the Dingee and Conard Co., West Grove, Pa.

#### A White Hybrid Perpetual.

The introduction by Messrs. B. R. Cant and Sons of a strong growing Hybrid Perpetual white Rose marks a decided advance. The flowers of the new variety, which is named Frau Karl Druschki, were staged before the Floral Committee on July 8, and an Award of Merit was bestowed. On stout shoots, the flowers are of Al shape and build, the broad, smooth petals having great substance, and they are as white as those of Innocente Piola. It is one of the best additions of late years, and is sure to make its way into every collection.

#### Notes on Early Flowering Roses.

Varieties of Roses that naturally flower early in the season, no-matter what section they belong to, are always appreciated; there seems to be such a charm about any Rose that opens its blossoms in advance of others. This is not the season really to test varieties for that purpose in their true character, the weather is, and has been, so unseasonable—indeed, it is surprising to me to see how well the plants promise, even if somewhat late, in their various stages of growth and development of flower buds. When speaking of early flowering Roses one should be careful to remember where the plants are growing, as all the difference imaginable exists in the same variety growing at the foot of a south wall as compared with the same sort growing in the open.

Quite one of the earliest Roses to open its blossoms is the old pink China when growing at the foot of a south wall. Either in bud or when fully blown this is quite one of the most charming of Roses. It is difficult to say how many years a plant will flourish in the same site with no attention being paid to it either in pruning or stimulating with manure. A plant of this variety close to where I write has flowered profusely to my knowledge for over twenty years with but a minimum of attention.

Against a wall Gloire de Dijon is still one of the earliest to give its welcome blossoms. A system of pruning to encourage vigorous base shoots is the way to get the best returns from this old favourite. From such growth there exists all the difference imaginable in the size and quality of the flowers.

Reine Marie Henriette is another early flowering Rose. The half-opened buds display this Rose at its best. Madame de Watteville, Princess of Wales, and Niphetos are a trio of Tea-scented varieties that early display their charms against a wall.

In the open we get a truer test of early flowering sorts. Quite a favourite is Carmine Pillar; its richly coloured single-flowered blossoms are always appreciated, and coming before almost any other of its section it is doubly prized. For cutting it is a gem; the blooms and buds are gorgeous by themselves, in a mass, or for associating with other flowers they are desirable. A mass of this Rose in a bowl along with Saxifraga hypnoides produces a telling effect.

Aglaia or Yellow Rambler, when its culture is properly understood, is one of the most charming of climbing Roses. It is a rampant grower, and requires age or management to induce it to flower freely. If pruned hard back it makes vigorous shoots, which fail to blossom at all that season, but if such growths are allowed to remain, provided they are not too thick, the plant will be smothered with its pale yellow blossoms in clusters of from six to ten on a spray. For covering an arch, pergola, or a pole no Rose is better adapted for the purpose.

Madame Georges Bruant is of the purest white, semi-double, producing its blossoms in bunches of from six to ten. It is strictly a bush, and flowers fully twice yearly. Pulverulenta is a pure white single-flowering variety, opening its blossoms earlier than any other. Celine Forestier against a wall is a pleasing Rose to grow. The soft yellow blooms are produced in clusters quite freely.—E. MOLYNEUX.

## Some Typical Gardens.

### IV.—A Place of Many Loves.

As the headline explains, my typical garden this week is not that of a one-plant specialist, but of a large-souled individual, who has room in his affections for many favourites, in all of which he takes an unfeigned interest. Let me say, however, that I have every respect for the one-plant man. By the concentration of his energies on this flower or that, marvellous improvements have taken place, but, in order to appreciate him fully, you must be imbued with similar tastes, and have special affection for the same plant or flower. Of course, this is an age of specialities, and the interests of popular flowers are furthered by societies formed by those enthusiasts who make particular hobbies of this flower or that. This is quite as it should be I have no doubt, but I must confess to having a weakness for the garden of many loves, that is tended by an individual who can disperse his affections equally, and be accepted as an authority on every plant he grows.

I enjoy the privilege of knowing such a man, and at all seasons his garden is a place for interest and enjoyment. I envy the owner, not only of his possession of it, but also of the ingenuity he displays in finding room for his many favourites in places suitable for their requirements. Do not think that the garden in question is a jumbled-up mixture of a hundred things, growing anyhow, one with another, without any display of order and arrangement. Not a bit of it; and this is just where the garden is unique. To describe it briefly, it seems as though little bits of the gardens of half a dozen specialists had been placed together and made into one, while the owner appears to possess the tastes of the above number of what we call one-plant men.

What is so much to our friend's credit is that the garden is of his own making. He tells his visitors that he was always a lover of flowers, and even in business days, when he lived in a town suburb, his little back garden was the envy and delight of his neighbours. When he left the old associations and took up his abode in the country, his acquaintances told him that he would tire of its quietness and monotony; but they did not know their man. He had already learnt something of the delights of floriculture, and when he found himself with time and facilities for pursuing his hobby, the knowledge he had gathered came to his aid. In its general aspects the garden differs little from hundreds of others. It is an ordinary enclosure encircling a country house, private as all true English gardens are, and sheltered by belts of shrubs. It is not a show place. No flower from it has ever won a prize in competition, simply because the owner does not exhibit, though his friends tell him he ought to do; but any person, be he stranger or otherwise, so long as he is a garden lover, is welcome to go in and see what there is to be seen. Our friend does most of the work himself, and the rest is performed, under his directions, by the odd man, who, I understand, is distinctly odd, by the way he has of mixing up labels and causing trouble in other directions, if not closely looked after. He does not share his master's love for flowers, nor yet his regard for order; but he is quite content to take second place, and so the two agree fairly well.

Early April is a pleasant time in the garden of many loves, and one of them stands out conspicuously at this season. It is the Daffodils, for which our friend has a fond regard. They meet you when you enter through the garden door, swaying in the breeze, and nodding a welcome as you pass by. They are grown on the orthodox system in oblong beds, with a large label at the end of each row, on which the name of the variety is plainly written. Here you gather the idea of the specialist, and as our friend turns up first one flower and then another, and discusses its points, you feel that it is no novice who is speaking. All sections are represented from the tiny Angel's Tears to the giant Empress, each one in its own place, and marked by its own label. The florist who lives for Daffodils alone would be happy here, though it is only a corner of the garden. "I grow my bulbs here," says our friend, "they grow themselves elsewhere." And there is evidence of it, for you see them in the grass under the trees, and dotted about in the shrubbery borders.

So much for one love, but there is another to hand on the beds in front of the house. When the Daffodils go out the Polyanthuses come in, and here again our friend displays his floral tastes. Polyanthuses in the ordinary way of culture are commonplace enough, but in this garden they have been made a study. The strain is superb, because poor forms are weeded out and the best only remain. Before the flowering is over every spring certain plants are selected, and the seeds carefully preserved. The latter are sown, and the next season's stock is raised. The method, you see, is not only that of a flower lover, but a thorough gardener, and if a collection of this old-fashioned flower is to be really interesting some defined line of treatment must be followed. "Everyone admires my Polyanthuses," says our friend, "and I have set lots of people up with seed; but, bless you! they do not trouble to select the plants afterwards, and the strain runs out."

Perhaps a birdseye view of this garden from a balloon would not be prepossessing, as it would look too much of a maze of beds and intersecting paths; but, as I have said before, our friend is a florist, and has laid out his garden to meet his requirements. The little Rose garden is a tiny place, but it stamps the owner of it as a rosarian. You enter it through a rustic arch, over which a Crimson Rambler climbs, and in June time it is a charming spot. The little beds, intersected by strips of turf, are cut in shapes to economise space, and in front of every plant dangles its zinc label, showing the name. This labelling of everything must be either done for the sake of order, or else for the benefit of visitors, for our friend never looks at one. There is no need for this, as he knows the flowers too well, and speaks of the beauty and habits of each one in a personal sense as though he were discussing an old friend.

"There is always a charm about a good Rose," he remarks, "wherever it is grown; but I was never so happy as when I got a fine flower from a shy variety in my garden near town, because then I felt that I had really achieved something. Here they grow themselves." There is a good deal of the Mark Tapley temperament about a florist in the satisfaction he feels when he accomplishes something under difficulties, and our friend displays it in his remark about the Roses. He has no special sections, for he loves them all. The H.P.'s have their own place, likewise the Teas. The climbers revel on the garden wall, William Allan Richardson rambles over the verandah, Maréchal Niel grows in the conservatory because its constitution is rather tender, and recently a rough corner was cleared for the latest addition in the shape of a collection of Penzance Briars.

But I must dwell no longer on the Roses, for there is a bed close by that merits some attention. Here the Carnations grow, and these flowers are amongst our friend's many loves. The collection is small, but it is up to date, and there is nothing slipshod about the cultivation. Glance at the labels, and you will see names of varieties that have been awarded honours, but our friend is not altogether satisfied with some of the modern introductions.

"Very beautiful," he says; "colour and form perfect, but very little scent, and a Carnation without it is wanting in its greatest charm." I quite agree with him. Layering season is a busy time in the garden of many loves, for the plants are mostly propagated in this way, wintered in pots in frames, and planted out the following spring for blooming.

"Like the rest of them," remarks our friend, "I have got a touch of the Sweet Pea craze, and until I grew them I had no idea how interesting they were." Then, if the season happens to be summer, he leads the way to the quarter where his latest favourites grow. Two or three dozen of the cream of the many varieties, each in its own little clump, and grown in this way because, as our friend says, he has not room for a great many of one sort. There is something of a mixture here, too, for between the clumps of Sweet Peas the Cactus Dahlias grow, and these have their own accorded place in the garden of many loves. Its owner frankly admits that he was no Dahlia man in the palmy days of the old show varieties, but when the beautiful Cactus section appeared he fell an easy prey, and year after year, as the new forms have been introduced, his collection has increased. He loves them, he says, because they are amongst the last of the outdoor flowers, and bloom on till frost puts the veto on garden products.

Of course, there is an herbaceous border, because our friend has a warm corner in his affections for hardy plants. It runs right through the garden, on either side of the centre path, and the great mystery is how he has managed to get so many plants in it. There is the same love for order, too, for you see no vigorous plant smothering its weaker neighbour. The neat labels give you the names (our friend knows them), and from year's end to year's end, with very few breaks, there is always something in flower. In a partially shaded corner at the end of the herbaceous border, a quantity of rough stones and boulders have been piled together, not with the idea of forming an artistic rockery, but to provide a habitat for the interesting little Alpines that ramble over the stones or nestle in the crevices.

"I like these little plants," says our friend, "because they won't be cultivated and improved upon. Give them what they ask for, and they will grow without any shifting and changing; but you must not try to make them do just what you want. They are not made that way." Follow the rockery to its termination. It ends in a low part of the garden, where a stream of water trickles through a hole in the wall. I think our friend is responsible for it coming this way, and the damming up of the water to form a little pool was done with a purpose. A few Water Lilies grace the surface, bog plants grow round the sides, and this little attempt at an aquatic garden must obviously be counted amongst the loves.

Our friend says he has never attempted much glass house gardening, except in the conservatory, which is a builder's legacy, and the frames he needs for propagation. The reason he gives is because he has too many loves outdoors to entertain any more. I asked him once if giant Chrysanthemum blooms did not attract him, but he answered in the negative, though he grows a few bush plants for the conservatory.

I have not enumerated all our friend's loves, but I can only mention one other—his books. He boasts that he is a book-learning gardener, and from his library he has obtained many of the methods that he puts into practice. When flowers are over his book love remains, to provide him with company and amusement on dull winter days. The volumes are mostly about flowers and gardens, and our friend has as much regard for the ancient authors as the modern ones, while his respect for the old florists is unbounded.

There you have my type of both gardener and garden. Neither of them are what you would call common, for few men possess the capacity for sharing their affections amongst so many favourites without one or more getting the preference. One-love gardeners are common enough, and horticulture has every reason to be proud of them; but I question if anyone could extract more real pleasure out of the craft than the owner of the garden of many loves.—A BRITISH RUSTIC.

## Edinburgh Notes.

Until now, the beginning of July, the effect of the continued coldness of the weather has been the absorbing topic of the horticulturist. Since the beginning of June we have scarcely experienced two consecutive days of summer weather, and from lack of sunshine, and cold east winds, less hardy vegetation has had a trying time of it. Many of the ornamental foliaged trees and shrubs have had their leaves so blasted and torn as to be quite out of character.

Early planted out bedding stuff, and more especially those which had not been thoroughly hardened off before setting out, has suffered considerably, and unless congenial weather ensues, will be long before it produces the desired effect.

The fruit crop has also been damaged, and is several weeks late.

Apples, Pears, and Plums which blossomed profusely have now turned out rather poor, and the crop will in most cases be a thin one. Strawberries, Gooseberries, Raspberries, and Currants are a fair good crop and so far free from insect pests.

Brassicas, and vegetables in general, are looking well, and promise to give a full return. That this latter crop is a full one is gratifying, especially to the market grower, who, owing to the drought last year, had a poor return. The first consignment of local grown Peas were offered for sale in the Waverley Market this week, being three weeks later than last season.

Apropos your excerpt from the "Florists' Exchange," on page 555, of your issue of the 26th ult., although I cannot herald the inauguration of a society such as there described, we have at any rate in our city gardener a genius who can be safely entrusted to keep our public gardens up to date in matters horticultural. The summer bedding in Princes Street Gardens is one of the sights of the city, and with a view to Coronation season designs have been made accordingly. In a future issue I trust to be able to give a more detailed description of this excellent work of Mr. McHattie's.

The Coronation fête and floral gala, held in Murrayfield Park, in some measure atoned for disappointment caused by the postponement of other entertainments. Owing to the backward season the floral entries were not what might be expected, but the other competitions were well contested. There was a large attendance of the public during the whole week, and the venture reflects credit on the enterprise of Mr. Hutchison. Were our two horticultural societies to hold a joint floral fête, with entertainments, every July, there can be no doubt but it would be a remunerative speculation as well as an interesting one for the general public. [To the last sentence we would add the words: Undoubtedly so.—ED.]—SCOTIA.

## Two Dahlia Manufactories.

This title fittingly describes the Dahlia industry, which can be observed in the months of February, March, and April, in the nurseries of Messrs. Dobbie and Co., nurserymen, of Rothesay, Bute, and Hobbies—i.e., Pastimes—Limited (John Green, Norfolk Nurseries, Dereham, Norfolk). One must go some distance from the centre of London to reach either of these establishments, and having reached them, it is possible to see where softwooded plants are turned out by the hundred thousand; and the visitor wonders, not so much where the plants come from, as it is possible to see the machinery of the production of the plant material in operation, but where they go.

### Dobbies of Rothesay.

I took advantage of the opportunity of being in Edinburgh to go on to Rothesay to see the Dahlia industry in full swing. It is a peculiarity of the Rothesay business that they sell an enormous number of cuttings of Dahlias, and in order to have

an early supply, preparations for propagating on a large scale have to be commenced before Christmas. A spacious oblong span-roofed house, some 60ft long by 16ft or so broad, with a brick-lined bed down the middle and a similar one of lesser width at the sides, is planted with Dahlia roots—ground roots, lifted from the open ground some two months previously; and in addition a number of pot roots—i.e., the unsold green plants of the previous summer. Mr. Cuthbertson said there were 10,000 roots in this house, planted as thickly as possible in the beds, and half covered with soil, leaving the crown of the root exposed to view, this being the point from which the young shoots are put forth. Hot water pipes pass through the beds, but they are not visible. At the time of my visit, the third week in March, the cutting trade was in full swing, though there had been no relaxation of the rooting of cuttings for the production of green plants for May orders. How busy the propagators had been was shown by the fact that in one large house there were some 50,000 cuttings placed round the sides of small pots, plunged in cocoa-nut fibre with a bottom heat of about 80deg.

But this was not all. Outside were lines of frames, heated,

cutting on the ledge of the bed; another ties the cuttings up into little bundles, the bundles are collected, sent into the packing shed, the order is checked, and then despatched. The packing rooms are admirable. They are an enormous improvement upon the packing sheds of fifty and less years ago. Messrs. Dobbie and Co. plant out over three acres of Dahlias, including seedlings, and a large number of green plants have to be held over to furnish pot roots for foreign and colonial orders in winter. During the month of May, and on into June, there is an increasing trade done in green rooted plants, which find their way to all parts of the kingdom.

#### Dereham Nurseries.

A month later I was inspecting the Dahlia manufactory at Dereham, Norfolk, as above (Hobbies, Limited), the horticultural managing director of which is Mr. John Green. Here Dahlia propagation is carried on to all appearance as extensively as at Rothesay. It was getting towards the end of the propagating season, but it was by no means over. Mr. Green, who is a well known raiser and exhibitor of Dahlias, having produced some

Holland Park Show—F. Cant's Roses. (See page 34.)

full of pots of cuttings already rooted, but undergoing a process of hardening previous to being potted off singly into small pots. They are taken into the potting shed from 2,000 to 5,000 cuttings at a time, potted off, returned to the warm house and kept close for a time, then hardened off in the frames in the open ready for the execution of orders.

The houses in which the cuttings are rooted have an inside shading to the roofs of green blinds, which can be drawn down over the interior at night so as to maintain the day temperature as equably as possible. Above the blinds are ventilators, always kept open, more or less, night and day, and over the openings in the ventilators is a covering of fine muslin, which, while not excluding air, yet prevents the downward rush of cold currents.

The sale of cuttings begins in February, and goes on until April. The main of the cuttings are despatched by post, packed in boxes with damp moss. As cuttings can be sold so much cheaper than plants, it is not to be wondered at that there is such a demand for them. The trade take great quantities, and the amateur class are eager buyers. It is interesting to watch the process of executing orders. A huge case of printed names is at hand: the collector of the order calls the name of the cutting he takes off, it is handed to him, and he lays it by the side of the

very fine varieties of the Cactus type, does no trade in cuttings, but the demand for plants is very great. Two or three large houses are devoted to the propagation of Dahlias, but of these the Cactus type very largely preponderates.

At Dereham seedling Dahlias are raised in very large quantities; they are to be seen by the thousand, and as we were looking over the pans of Cactus varieties, Mr. Green pointed out some with quite pale main and leaf stems, and he said these are pretty certain to produce white flowers, and, he added, there is plenty of room for a good white. As these seedlings are all from the best blood, it is reasonable to suppose some very fine novelties may appear among them.

It will be remembered that at the exhibition of the London Dahlia Union, held at the Royal Aquarium, Westminster, in September last, Mr. Green had on his stand blooms of a new type of single Dahlia known as President Vigier, or the Collarette type—"a single Dahlia with a collar." This is being largely grown at Dereham, it being held that so much curiosity was excited over the type that it is pretty certain to be in considerable demand. Enough to state that the Dahlia is very widely recognised here, and every type is to be found in stock; among them some highly promising new Cactus varieties.—R. DEAN.

## NOTES

## NOTICES

**National Dahlia Society.**

A meeting of the Committee of the above Society will be held, by kind permission of the Horticultural Club, in the Club Room, at the Hotel Windsor, Victoria Street, S.W., on Tuesday, July 22, at 4 p.m. Business: Election of Judges. Advertising exhibition. Other business.—J. F. HUDSON, Hon. Secretary.

**York Gala.**

Mr. J. C. McPherson (who does not comply with our request not to write privately to correspondents, but instead, to address the Editor) writes from Londesborough Park, Market Weighton, Yorks, as follows: "An error was made in your paper of June 19 in the report of the York Gala and Horticultural Show. In the fruit classes for a collection of six dishes I was awarded first; not Mr. Goodacre." Our representative at the show complained of the limited time at his disposal for gathering up the awards, and reporting in a crowd is no joke.

**Cardiff Flower Show.**

We are requested by the secretary of the Cardiff and County Horticultural Society (Mr. H. Gillett, 66, Woodville Road, Cardiff) to draw attention to the Affiliated Societies' Competition for a challenge trophy (silver bowl), value £26 5s., together with three guineas in cash, "for the best collection of cut flowers, grown in the open, occupying a space 12ft by 3ft. The second and third prizes are two guineas and one guinea respectively. Bracketed to receive the same awards as prizes is another class for "the best collection of vegetables, occupying a space of 6ft by 3ft."

**The Progress of Novelties.**

Every now and then some new plant or flower makes its entrance on the horticultural stage, and claims the applause of the boxes and the gallery alike. Everyone interested longs to have the new thing, and those who have the means can soon become possessed of it. Others have to wait awhile till the novelty stage has worn off a little before their turn comes. It does not seem long since the beautiful Begonia Gloire de Lorraine made its appearance, and created a sensation in floral circles, and now, practically speaking, it is a common plant, more widely grown and better known than hundreds of others that have been in cultivation ten times as long. Only recently I saw some well flowered specimens of this charming Begonia growing in the little greenhouse of a working amateur. A few years ago the plant would have seemed beyond his means; but Gloire de Lorraine captured public taste, and where there's a will there's a way.—H. C. W.

**A Promising Career Cut Short.**

It is with pain and regret that we record the death by drowning of a friend and late fellow student of ours when in Edinburgh, Mr. Archibald Dods Hogg, son of the late Mr. John Hogg, Dalkeith, who left Edinburgh on Monday last for St. Andrews, where he had been appointed to assist Professor M'Intosh in the Marine Observatory. After tea, on Tuesday, he left his lodgings for a walk, and did not return. Inquiries were set on foot next day, and meanwhile some mussel dredgers reported that while at work in the River Eden, opposite the farm of Rives, they had found a gentleman's grey jacket containing several letters in the pockets addressed "Mr. A. D. Hogg, Royal College of Science, South Kensington, London." It is believed that Mr. Hogg lost his life while bathing or in an endeavour to obtain zoological specimens. Mr. Hogg was twenty-five years of age. Educated at Dalkeith High School and George Watson's College, he worked for four years as a gardener in Dalkeith Palace Gardens, and also for some time in the Royal Botanic Gardens, Edinburgh. He took classes at the Heriot Watt College, and gained a National Scholarship, which he has since held at the Royal College of Science, South Kensington, where he was the best man of his year in zoology. On this account he was recommended as assistant to Professor M'Intosh.

**Strawberry Season in Hampshire.**

In spite of an unusually rainy June, Hampshire Strawberries are very plentiful and of excellent quality this year. There is at present a ceaseless procession of the specially constructed carts, conveying a multitude of baskets of Strawberries from the fields to the railway stations. The season's output is roughly estimated to be 6,000,000lb of fruit.

**Dundee Horticultural Association.**

"Carnations and their Value as Garden Flowers" was the subject under discussion at the monthly meeting of the Dundee Horticultural Association in the Technical Institute, on July 3, the subject being opened by Mr. James Kydd, Forthill Gardens, Broughty Ferry. An interesting competition took place for three vases of Roses, the awards being in the following order:—First, T. Butchart, Elmslea; second, A. C. Cameron, Bironck; third, T. C. Brown, Balcairn. Mr. James Reid, Dudhope House Gardens, exhibited a collection of Pyrethrum blooms; Mr. Nicoll, Farington Hall, a collection of cut herbaceous flowers; and Mr. Bethel, Newport, specimens of new Potatoes, Peas, and Cauliflower.

**Edinburgh Coronation Decorations.**

Although these in the main were done in an artificial manner and were on the whole very elaborate and tasteful, a few were arranged in natural flowers and evergreens, notably the Scottish Widows' Fund buildings, which was carried out by Laird and Sons, Limited, and was very prettily done in evergreen festoons and Palms of sorts, and the lower windows and balconies filled up Marguerites, Pelargoniums, and other plants, and attracted much attention. Another very pretty and attractive decoration was that carried out by Messrs. Leith Brothers on the British Linen Bank, in St. Andrew's Square. All of the many windows were filled in to represent the Union Jack, and were done with Pelargonium Raspail (red), Marguerites (white), and Lobelia (blue), and looked superb. Over the porch entrance was an immense crown 7ft in height and most tastefully done up.—W.

**Royal Trees.**

I observe that the King before leaving Rangemore commemorated his visit by planting a Cedar of Lebanon. May the Royal tree flourish and prosper. This custom of Royalty is a particularly happy one, and there are many sturdy specimens in different places that were planted by our late Sovereign, Queen Victoria. They are thought much of, and as the years roll on their fame will increase. It will be the same with the Royal tree at Rangemore if good fortune attends it. The Cedar of Lebanon is a noble tree when fully developed; but the present monarch will have been gathered to his fathers before the Rangemore specimen can reach its full proportions. The tree planted by King Edward the VII. is famous already; its fame will grow as time rolls on, but will reach its height years hence as a living memento of the Royal visit to the beautiful home of Lord Burton.—H.

**Irrigation Farming.**

From the title as above, the reader will conclude that the book to what it belongs is not of English make, but American. Our great need in the United Kingdom is drainage, not irrigation. True it is that the garden hose is required ever and anon, but a stream, or river, or spring is always at hand to generally feed as many pipes as the cultivator cares to lay on. In British agriculture, irrigation is seldom practised. The book we here notice is published by the Orange Judd Company, of New York, the author being Lucius M. Wilcox, editor of "The Field and Farm," and is suitably illustrated. We have endeavoured to give it a patient consideration, but not having seen the principles of irrigation such as are applied on an extensive scale in the arid tracts of many of the United States carried into practice, we found the book and its American technical phraseology not at all absorbing. That, however, must be set down to our own ignorance, for we believe Mr. Wilcox has written a useful book, and one that is "understandable" (to employ a word of his own), the diction being by no means "above the heads" of the class of readers it is intended for. We notice he classes the garden merely as a part of the farm, and garden culture out west is, from his statements, far below the British standard of gardening. (7 by 5. Pp. 494, with index.)

**Cornish Gooseberries.**

Gooseberries are being sent away from Cornwall in large quantities at the rate of ten guineas per ton, which is the highest price recorded for a decade.

**Death of M. Simon Delaux.**

We regret to learn of the death of this notable French horticulturist, who was particularly distinguished in the culture of Chrysanthemums, and to him is due a great number of the best French varieties. He died on the 8th ult., at Toulouse.

**Edinburgh Botanic Garden Staff.**

Following the retirement of the late head gardener, Mr. Richardson, in reference to which we furnish a separate paragraph, the work of cultivation has been divided into three sections, each with a foreman, thus:—Glass department, Mr. L. Stewart; herbaceous and Alpine, Mr. D. S. Fish; and garden trees and shrubs, Mr. W. Smith. Mr. Harrow succeeds Mr. Richardson as head gardener.

**June Weather at Temple House Gardens, Great Marlow.**

There was a heavy thunder and hail storm on the 7th and thunder again on the 16th. The maximum temperature for the month was 84deg on the 28th and the minimum 36deg on the 9th. The maximum temperature for June, 1901, was 81deg on the 9th and the minimum 36deg on the 18th. The rainfall for June, 1901, was 1.36.—GEORGE GROVES.

**Odours and Colours in Plants.**

What is probably true of odour in plants is equally probable (suggests the "Morning Post") as regards colour. Blossoms of flowers are, as a rule, avoided by animals. Therefore we find the leaves of plants often imitating the colours of flowers, as in the case of Geranium leaves, the leaves of the Begonia, and Indian Nettles. Resembling odours are not very common among the flowering class of plants; they are found more often in the fungi.

**Gordonia lasianthus.**

The question has been asked of me (says Joseph Meehan) whether *Gordonia lasianthus* is not the equal of the *G. pubescens*, and whether it is hardy at the North, to which I would answer, No, in both cases. This species has been under my care twice for trial. The plants on both occasions struggled along for two or three years, getting partly killed every winter, and, finally, dying outright. Probably at Washington, D.C., and vicinity it might prove hardy. The flowers are very pretty, but are smaller and less conspicuously beautiful than those of *G. pubescens*. As a tub plant it is very fine, and blooms freely every summer.

**Sussex Weather.**

The total rainfall at Abbot's Leigh, Haywards Heath, for the past month was 3.53in, being 1.52in above the average. The meanest fall was 0.56in on the 7th. Rain fell on sixteen days. Total for the six months, 11.34in, which is 0.83in below the average. The maximum temperature was 83deg on the 28th, the minimum 41deg on the 10th and 11th. Mean maximum 69deg, mean minimum 48.29deg; mean temperature 58.64deg, 1.52deg below the average for the month. A decided improvement in the weather took place after the 20th. The ten days' brilliant weather culminated in a heavy thunderstorm on the evening of the 30th, with some rain. Thunder has hung about to-day (the 1st), but the barometer is well up and is rising. A continuance of bright weather would be most welcome.—R. G.

**June Weather at Belvoir Castle, 1902.**

The prevailing direction of the wind was south; total, twelve days. The total rainfall was 2.05 inches, this fell on seventeen days, and is 0.07in below the average for the month; the greatest daily fall was 0.55in on the 12th. Barometer (corrected and reduced), highest reading 30.276in on the 24th and 25th at 9 a.m.; lowest, 29.420in on the 13th at 9 a.m. Thermometers:—Highest in the shade, 82deg on the 28th; lowest, 36deg on the 10th; mean of daily maxima, 64.60deg; mean of daily minima, 47.73deg; mean temperature of the month, 56.16deg; lowest on the grass, 32deg on the 10th; highest in the sun, 141deg on the 30th; mean temperature of the earth at 3ft 52.53deg. Total sunshine, 183hr 30min, which is 2hr 10min above the average for the month; there were four sunless days. The temperature has again been very much below the average.—W. H. DIVERS.

**Itea virginica.**

Now that the greater number of spring flowering shrubs are over, it is a pleasure to have in bloom *Itea virginica*. This native shrub is not in general collections, though very worthy of being. Besides being covered just now with its finger-like spikes of white flowers, in autumn it is one of the handsomest of foliage shrubs, its leaves changing to a most brilliant, intense red. It should be noted to be set out next autumn by those looking for shrubs having brilliant coloured leaves.

**Pancratium illyricum.**

A Roxburghshire correspondent recently sent a flower scape of this handsome Amaryllid, native of the South Mediterranean regions, for identification. With a lady friend of his, he says it grows out of doors on a vinery border, and blooms most profusely, setting large quantities of seeds every year. The seeds are hard and green, and in size as large as Broad Beans. The flowers are borne in scapes in clusters of from six to twelve. They are 6in long at least and pure white, the foliage being 1½in broad and some feet in length. It is a good border plant.

**Mr. Geo. Wythes and Alnwick Castle Gardens.**

Mr. G. Wythes is, we hear, giving up charge of Alnwick Castle Gardens. Of late Mr. Wythes' health has not been very good, and the charge of two such large gardens so far apart is not advised.

**Australian Cricketers at Highbury.**

On Tuesday, July 8, by the courtesy of Mr. Chamberlain, the Australian team of cricketers now touring in this country paid a visit to the gardens and plant houses at Highbury, with which they were much delighted.

**£3000 Worth of Flowers.**

This is the reported sum computed to have been spent on flowers for the decoration of the rooms and banqueting hall on the occasion of the reception of the Indian princes now in London, by the India Office, on Saturday, July 5.

**The late M. Marc Micheli.**

The death of this distinguished Geneva botanist recently is announced. He will be remembered as being one of the first to graft *Clianthus Dampieri* on to young plants of *Colutea*, by which means the beautiful "Glory Pea" has become far more common and easier to cultivate. He also introduced the newly certificated *Fritillaria askabadensis*, the flora of Western Asia being a particular study of his.

**Fish which Like Cherries.**

What is known among anglers as the "Cherry season" has opened on the Thames. Chub are very fond of this fruit, and the angler, placing a single cherry on the hook, allows it to float down the stream at spots likely to harbour chub. The fish dart cut from their haunts and seize the cherry, only to find that it is scarcely the kind of dessert they bargained for. As much as 70lbs of chub have been taken in the Thames with Cherries in one day's fishing. Chub are sometimes caught with Strawberries in the Thames.

**Mr. A. D. Richardson, Edinburgh.**

We take the following from our contemporary, the "North British Agriculturist": "Last month, Mr. A. D. Richardson retired from the post he had so long held at the Royal Botanic Garden, Edinburgh, in order to set up in business as a landscape gardener and consulting forester. Many of his former pupils and numerous friends throughout the country are desirous of expressing in some tangible form their appreciation of his services in the cause of horticulture, forestry, and botany; and especially of recognising the valuable help he has long given so ungrudgingly to young men less favourably situated than himself for acquiring a comprehensive and scientific knowledge of plant life. Messrs. D. F. Mackenzie, factor, Morton Hall, Liberton; Donald Robertson, Dunrobin, Golspie; D. Young, Editor, 'N.B. Agriculturist'; Alex. Pitcaithley, Jeannie Bank, Scone; George P. Berry, lecturer on horticulture, Cockle Park Farm, Northumberland; George Leven, Aucheneruive, Ayr; William Davidson, Margam, N. Wales; with J. F. Ammand, Haystoun, Peebles, as hon. secretary and treasurer, have agreed to act as a committee to carry through the necessary arrangements. A meeting of subscribers will be called at an early date to decide what form the presentation should take."

## Primula obconica as a Bedding Plant.

Though by some much decried, if not actually abolished since the discovery of poison in the leaves of this *Primula*, there are, nevertheless, some who are sufficiently fearless and unconcerned as to cultivate them for decorative purposes in pots, and it cannot be denied that they do possess a very great and accommodating merit as a decorative plant. The poisonous properties possessed in the leaves affect not every one alike. Some there are who feel no possible inconvenience, while others must, so to speak, keep them at arm's length. As a bedding plant I have not grown them, but since I have seen them applied to this purpose so effectively at Forde Abbey, a desire is raised to do so elsewhere. So many plants are nowadays applied to bedding purposes that the novelty of former days at the advent of some innovation in the character of bedding plants is now not so keenly acknowledged. That the hardy *P. obconica* is used in many flower garden arrangements may be taken for granted, yet, while this is true, there are many flower gardens yet without the acquaintance of these plants in summer and autumn. The floriferous nature of these *Primulas* needs no new praise, because they are so well known to everyone; it is, however, the knowledge of this fact that so readily admits them into a sphere hitherto unoccupied by them. To those who grow a quantity in pots for conservatory and house decoration, it need only that these be hardened off preparatory to their occupancy of beds or borders outdoors. Where they are not so freely grown, and a desire exists to apply them to this summer purpose, preparation need be made for doing so at some previous date. It is known to many that in spring sowing there is often much fickleness displayed in raising these *Primulas*, and more often than not a partial success only is obtained. To overcome this difficulty new seeds are recommended, which means autumn sowing instead of waiting until spring, or, rather, the early months of the year, to do so. This would be necessary for getting strong plants ready for summer bedding where none, or an insufficient stock, of pot plants were available, because in their early stages they are very slow in their progress. Since Mr. Crook has discovered their high merit for bedding uses, a large stock is kept up for the dual purpose—indoor and out. July and August would be a suitable period for sowing for the summer of 1903.—W. S.

## Groups at Holland Park Show.

The following are notes on some of the groups at the recent show at Holland Park: Messrs. Hill and Son's (Barrowfield Nurseries, Lower Edmonton, London, N.) group was arranged with excellent judgment, and including the following distinctive and handsome Ferns and plants: *Gymnogramma Alstoni*, *G. grandiceps superba*, *Adiantum tinctum* (finely coloured red), *A. peruvianum*, *A. pedatum* (the Bird's-foot Fern), *A. rhodophyllum* (also coloured), *A. macrophyllum* (tinted purplish), *A. Farleyense* (a soft, feathery mass), and *A. Veitchei*. The beautiful little *Pellea rotundifolia* was nicely shown, together with *Pteris tricolor*, which was brilliantly distinctive, *P. longifolia Mariesi*, *P. seaberula*, and *P. Smithiana*. Other genera exhibited were *Davallia tenuifolia Veitchei*, *Polypodium vacciniifolium*, with long, hispid shoots, which hang; the tall *Blechnum brasiliense*, and the twining *Lygodium japonicum*. *Platyserium grande* was also bold and characteristic. *Hymenodinium crinitum* is a nice thing, and *Lomaria attenuata* is well known. *Polypodium appendiculatum* and *Lygodium dichotomum* with *Leucostegia immersa* were others of those shown. *Ficus repens variegata* and *Saxifraga umbrosa variegata* were displayed in front. Cork-bark and moss were largely employed, and many of the Ferns were on tall pedestals.

In Charles Turner's (Slough) group of Roses, the standard *Wichuriana* crosses formed a very conspicuous feature; budded as they were on stocks 3ft. or more in height, the slender branchlets drooped shower-like on all sides in the umbrella pattern. A number of different varieties, though all from the same cross, were seen, the best being *Auguste Barbier* (pink), *Alberic Barbier* (white), *Paul Transon*, and *Reine André*. The more popular H.T.'s and decorative Roses were arranged along the front in vases, while large masses of *Crimson Rambler*, *Queen Alexandra Rambler*, *Aglaia*, and *Psyche* gave the group a rich effect.

Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, were first in class 14 for a collection of thirty-six bunches of garden Roses, the names of which we took, but, unfortunately, they have gone astray. A similar group was shown by the same firm last week at the Temple,

when the varieties noted were *Gustave Regis*, *Aglaia*, *Reine Olga de Wurtemberg*, *Ma Capueine*, *Madame Louis Poucet*, *Crested Moss*, *Madame Cochet*, *Rainbow*, *Thalia*, *Camoens*, *Macrantha*, *Souvenir de J. B. Guillot*, *Claire Jacquier*, *Leuchstern*, *Fellenberg*, *Papillon*, *Mme. Pernet Dueher*, *Rubin*, *Anna Maria de Mont-ravel*, *Gloire de Polyantha*, *Annie of Gierstein*, *W. A. Richardson*, *Rosa Mundi*, *Alister Stella Gray*, and *Blanche Double de Coubert*. Each of these has a telling effect when planted and allowed to grow in great masses with little pruning in the garden or grounds. On page 31 we figure Messrs. F. Cant's group.

Holland Park Show—Hill's Group of Exotic Ferns.

The Begonias from Messrs. Blackmore and Langdon, Twerton Hill Nursery, Twerton-on-Avon, Bath, were of exceptionally high quality. The strain is certainly a superior one of good habit, and the culture given to the plants had resulted in large flowers of the best shape. The illustration on page 37 will testify to these remarks. A number of their finer varieties were noted as follows: Captain Henderson, a very handsome scarlet; Lady Wilmot, dark crimson, flowers sometimes 6ins in diameter; Mrs. Kendall, rose-blush; Mrs. G. F. Hodder, a very attractive pink, with a lighter centre; Ophelia, crimson; Seagull, spotless white; and Sunset, orange-scarlet; all of which are double-flowered tuberous Begonias. As a

general rule, single flowers are preferred, on the grounds of gracefulness and beauty-character, to double ones; but there are exceptions, and double tuberous Begonias give an instance. Here the flowers are full and rich, having something "to look at," rivalling in their best forms even the Roses.

Holland Park Show—Turner's Group of Roses.

## Early Forced Fig Trees.

**SECOND CROPS.**—The fruits on early forced trees have now swelled to a good size, and, being judiciously thinned, there will be a crop of good Figs towards the latter part of the summer. To insure this the foliage must be kept free from insects and the feeding liberal. When the crop is heavy and the former thinning not having been sufficient, a second thinning should take place at once, leaving the most forward at the base of the shoots, which will ripen earlier than the others, and so afford more time for the ripening of the shoots at their points, these being kept well up to the light. Early forced planted-out trees should have the young wood ripened and be resting by the middle of October.

**WATERING AND FEEDING.**—If the borders in the house started at the new year have become dry whilst the first crop of fruit was ripening, they must be watered repeatedly until the soil is properly moistened through to the drainage. Liquid manure will be required by trees having the roots in borders of limited extent, and more frequently than by trees with a large extent of rooting area; about once a week in the first case and every fortnight in the other, giving thorough supplies; and always in a tepid state. Top-dressings of fertilisers may be given at intervals of three weeks or a month, always after watering, and then washing in moderately. A light mulching is beneficial in supplying nutriment, keeping the soil moist, and encouraging surface roots, but it should be kept moist by sprinkling when it becomes dry.

**SYRINGING AND INSECTS.**—Syringe the trees twice a day, except in dull, wet weather, when morning or early afternoon syringing will be sufficient, and always early enough to allow the foliage to become dry before night. Judicious and forcible syringings are usually sufficient to keep down red spider, but if it and scale gains a footing they must be dislodged by the use of an insecticide, for which the carbolic acid and petroleum soft-soaps are effective. Old scale must be dislodged by a brush. Painting the hot-water pipes with a cream formed of flowers of

sulphur and skim milk, after heating them to 160deg to 200 deg, keeping the house closed for an hour or two with the sulphur on the pipes, is an effectual remedy for red spider and a good preventive of spotting in the fruit from attacks of fungus. The foliage should be dry, and the following morning the trees should be well syringed. Repeat the heating of the pipes and brushing them with sulphur in about ten days.

**TEMPERATURE AND VENTILATION.**—Unless the weather be unusually cold and wet artificial heat will not be necessary, but fire heat must be afforded to maintain a temperature of 60deg to 65deg at night and 70deg to 75deg by day. Ventilate early on fine mornings. Keep the house through the day at 80deg to 85deg with sun heat, and close early so as to run up to 85deg or 90deg, or even 95deg to 100deg, providing abundance of atmospheric moisture.

**FRUIT RIPENING.**—When the Figs change colour afford more air, insuring a circulation. Reduce the moisture gradually, keeping water from the fruit, which expose as much as possible to light and air. Lessened supplies of water tell in favour of quality, yet keep the soil moist, damping the surface occasionally.

**TREES SWELLING THEIR CROPS.**—Afford a light mulching of short manure, and through this supply tepid water, or in the case of trees carrying heavy crops and not over-luxuriant, liquid manure with alternate dressings of artificial manures. It is scarcely possible to overfeed Fig trees in well-drained, properly constructed, narrow borders, but deep borders and wide favour growth at the expense of fruitfulness. The trees grow splendidly and produce little beyond leaves. In fine weather syringe twice a day, always in good time, and close so as to run up to 90deg, 95deg, or 100deg. As the fruit approaches ripening provide a little ventilation before nightfall and let it remain, increasing it early so as to dissipate moisture deposited on the foliage during the night before the sun acts powerfully on the house.

Grand Figs are grown in cool houses, one crop ripening in August and September. Calcareous soil, well-drained narrow borders, light well-ventilated structures afford best results. The chief points are to grow them, feed highly, ventilate early, close soon enough to keep a good heat until the evening, affording abundance of atmospheric moisture. Avoid overcrowding the growths, stop side shoots at the fifth leaf, and water liberally. Let the shoots grow with their points to the light, just keeping them clear of the glass, and they will fruit abundantly.

—GROWER.

### The Judas Tree.

In reference to the Judas Tree (*Cercis siliquastrum*, page 534, No. 2,803 of the *Journal of Horticulture*), the "Westminster Gazette" states there is not more than four specimens in England. Are you or the "Gazette" aware there is a fine specimen on this estate (Wellbury, Hitchin), 18ft high, 15ft through, and twenty-seven years of age? I think perhaps this one is unknown to horticultural friends.—CONSTANT READER.

[We did not know that so fine a specimen existed, but we believe that the computation as to numbers by the "Westminster Gazette" is far from being correct.—ED.]

### Do Bulbs Rest?

Your correspondent, "Y. B. A. Z.," asks, "Do Bulbs Rest?" I have been puzzled with the behaviour of *Tropæolum pentaphyllum*. I planted early last year two tubers, one at the foot of a south wall and one of a west wall. They broke at the beginning of October. With some protection they weathered the winter, and one is now growing away with fair vigour and the other more weakly. A tuber planted last year, also on a west wall, broke early, and was a lovely sight, growing about 10ft high, and blooming profusely; this was left undisturbed in the ground, but it shows no sign of starting. Examination shows the tubers to be sound, but I am afraid shall have to wait till autumn, when they may start at an unfavourable season. Another plant I have, tuber left in the ground, has broken, and is growing favourably. I wonder if any special treatment will ensure the growth starting early for the summer bloom?—T. J. T.

### Princess of Wales Violet in Summer.

I can fully bear out what your correspondent remarks of pot plants of this Violet flowering in summer. It does so here regularly, and, I think, though the blooms are not so large, that they are even more beautiful than those of the first crop. I made a cross of double white *Narcissi* and these Violets last month, which formed an altogether lovely combination. But, in addition to flowering so late, it is possible, by allowing the runners to grow after the plants have been housed in autumn, to secure a second crop of bloom from these, flowers being produced from the axil of each leaf.—R. P. BROTHERSTON.

### Trees and Shrubs in Scotland.

You must have a large number of readers in Scotland, although little appears in your columns directly applicable to difficulties and successes there. The letter by "D. C." in the current issue of the *Journal* will be interesting to many. Numerous shrubs and plants flourish here under conditions that appear totally antagonistic to their assumed characteristics. The experiences of your readers, where success has resulted, would enhance the attractiveness of many places that are presently given over to Cherry and Portugal Laurels. In my garden on the Firth of Clyde, I can to-day gather a basketful of Roses, among them such reputed shy bloomers as *Perle des Jardins* and *Devoniensis*; while *Gustave Regis*, *Allister Stella Grey*, and such free bloomers are laden down with buds. Two bushes of *Choisya ternata* are growing strong, and are full of sweet white blossoms. An *Escallonia macrantha* reaches the top of a wall, 12ft or 15ft high, and in another position forms a dividing hedge. A *Clematis montana* threatens to strangle a Cherry tree, while *C. vitalba* is executing a like murderous office upon a Rowan, and the large flowered varieties make pictures on the walls. Rosemary and Lavender both bloom. *Passiflora cærulea* and the white variety push among the Ivy, and deck it with their starry blossoms. A *Camellia* of small size, in a sheltered spot, perfected a considerable number of blossoms. An *Arbutus* was cut down by frost some years ago, but has started away again, and bears blooms and fruit. The truth lies in "D. C.'s" comment that we accept as gospel what has been handed down to us, and make no effort to prove the adaptability of the numerous lovely things which merge upon the line of "not quite hardy."—AN OLD READER.

### Profitable Apples of Upright Growth.

In replying further to "Beginner," let me say that Lord Grosvenor is a compact, yet strong, upright grower. Bramley's Seedling spreads considerably, but as it grows strongly and upright when the trees are young, by pruning it can easily be kept in a condition suitable for "Beginner's" purpose. Duchess of Oldenburg is quite an upright kind, and a grand cropper to boot. Beauty of Bath and Pott's Seedling are also upright growers. I have just been looking at a heavily laden tree of Frogmore Prolific, and it reminds me that I should have included it in my former lists, as it is a grand Apple, and grows upright. I have seen splendid samples of Allington Pippin growing in a stiff soil, where it crops well, and it seems to me that it must become a popular market sort. Golden Spire seems to be little known, but it is a grand cooking Apple, which crops as well as Lord Suffield; but the fruit is longer, and very much brighter in colour. It is usually ripe by the end of September, and grows quite upright.—H. D.

### Violas at Tamworth.

The midland town of Tamworth, so noted for its potteries and celebrated breed of pigs, has during recent years become associated in the gardening world as the birthplace of many of our best Violas, and being an ardent fancier of this flower I had long entertained an idea of visiting this centre to inspect the nurseries of Mr. W. Sydenham, and, receiving a cordial invitation from that gentleman, I proceeded the first week in August of last year to Tamworth. Most of your readers will remember the violent gale the Saturday before the Bank Holiday which did so much damage throughout the country, especially to our fruit and market crops, and didn't it just blow at Tamworth!—yes, and rain, too! But to enthusiasts the weather matters little at any time, so we were not deterred from walking through the beds of Violas—and such beds, too! It seemed to me each bed of the popular varieties would contain about a thousand stock plants, while the others would contain half that number. I leave the reader to imagine what one hundred and sixty varieties of such beds would look like—to me they were a perfect sea of flowers—covering quite an acre of ground.

When we consider the number of cuttings a bed of such dimensions will produce it will give some idea of the vast quantity required here for propagating purposes. The effect produced by the bewildering shades of colour was simply charming, for though the wind had played such havoc with the herbaceous plants and the early-flowering Chrysanthemums in the open quarters, its only effect on the Violas was to blow them all one way; but after the wind decreased and the sun shone forth, in an hour or two they were as happy looking as though there had been no wind in the Midlands for months.

As Mr. W. Sydenham is now so noted as a raiser of Violas, I naturally expected to see a goodly number of seedling beds; but the quantity was an eye-opener for me, for there were literally thousands and thousands of them—beds devoted to distinct colours, such as white, yellow, and blue, and so on, while huge breadths of the mixed colours were all in the full beauty of their youth. I gathered that, although Mr. Sydenham does artificially cross-fertilise, his experience has been hitherto that his best seedlings have come from chance seed gathered from the best varieties—an easy matter at Tamworth, for the seed of each variety is saved separately, so that the parentage is always known, at least, so far as the seed parent is concerned. To a Viola fancier these beds were most interesting, and I spent a very pleasant hour looking over the likely-looking youngsters. Ten years ago one might have selected a hundred that would have been worthy of a name; but things have altered, ideas are now narrowed down, for the advance made during the last decade with this flower has been pretty considerable, and a variety that would have been considered a gem a few years ago must now be passed over, for the Tamworth varieties are not only noted for their flowers, but also for their habit of growth, and a form, however good the flower, is considered a weed by Mr. Sydenham unless the habit be good also. And I think this is as it should be, for although the Viola exhibitor has to be considered, the general public must come first, and the life of a Viola is indeed short if it should prove to be a bad garden flower. Some capital novelties were marked for further trial, and it seemed to me a goodly number of others were worthy of similar notice, the seedlings from Lark being especially noticeable.

I observed that a change of ground is deemed as necessary here as at most places, and *Narcissi*, *Roses*, *Chrysanthemums*, and herbaceous plants are used extensively as change crops, and, in spite of this, large square patches of the paddocks have also

been called into requisition. I did not ask Mr. Sydenham his views on this point, but my own personal experience has been that fresh soil becomes an absolute necessity, no matter how it is manured or cultivated; for after a few years there seems to be something lacking which cannot be replaced except by fresh ground, and this is the experience of my friends also.

The soil at Tamworth appears to be a reddish sand—the same colour as their pigs—overlying a sort of clay; an ideal soil for working, and, judging from the luxuriant growth of all classes of plants, a most generous one. That the *Violas* are not grown on strictly temperance lines I readily observed from the huge heaps of peat moss manure packed ready to go on the ground as the crops come off, amounting to two or three hundred tons, and I was told much more was used during a season. No doubt this holds the moisture, apart from its fertilising properties, and accounts to some extent for the healthy growth of the plants.

One can readily imagine that such a vast quantity of plants must make the propagation a serious item, and large frame grounds are provided for this accommodation. The frames used are just like miniature span-roofed houses, and the lights are fixed to the ridge with hinges, so that either side can be readily lifted for any purposes. Each frame holds about a thousand cuttings, and as some hundreds of them are utilised it will give some idea of the number of plants propagated in them. At the time of my visit early propagation was in full swing, and the soil being naturally adapted for this purpose, no preparation is required. I shall reserve my notes on the new and old varieties for a future issue, or I shall have the editor using the scissors and paste to bring my notes down to a respectable length. —J. B. R.

## Societies.

### Royal Horticultural—Drill Hall, July 8th.

An interesting meeting and well-filled hall was that on Tuesday last, though Orchids were fewer than at any time during the past season. Messrs. B. S. Williams and Son staged a mixed group and Messrs. Hugh Low and Co. had *Cattleyas*, other plants coming from Messrs. Veitch and Bull and Sons.

Hardy plantsmen were strongly in evidence, and Messrs. Barr and Sons had Sweet Peas in liberal quantities. Besides these, they had in their group *Iris monspur*, *Lychnis Haageana* and *L. chalcedonica*, *Phlox viscosa*, and other good plants, notably *Delphiniums*. Mr. Amos Perry and Messrs. Pritchard had also nice groups, the former staging *Calochorti*, *Heuchera sanguinea splendens*, and others, with *Ostrowskia magnifica* in capital condition.

The *Petunias* from Mr. J. Surman, of Beckenham, were all well flowered and the blooms were large, but Messrs. Cutbush's *Carnations* were one of the chief features of the show. Their varieties included the following, among others:—*Nautilus*, blush-pink; *Lady Rose*, deep pink; *Maggie Hodgson*, rich dark crimson; *Mrs. Trelawny*, very bright deep crimson; and a large group of the yellow *Cecilia*.

Single-flowered tuberous *Begonias* came from Messrs. Cannell, the finer being to our minds Sir J. Lyne, rich bright crimson; *Lady Wyndham*, salmon; *Seymour Lucas*, rich crimson; *Mrs. Brook Taylor*, Apple-blossom tint; and *Martial*, scarlet crimson. A back row of *Kochia scoparia* in 5in pots was of value. Stove and greenhouse foliage plants (a fine group) came from Mr. J. Russell, of Richmond, and Mr. H. B. May had grouplets of distinctive and good Zonal *Pelargoniums*.

Another feature of the exhibition was Messrs. Kelway's group of cut *Delphiniums*. These were strong and good, and some beautifully-coloured varieties were noticed. We name a few:—*Queen of Huish*, *Dorothy Daniels*, *Lord Rothschild*, *Earl Roberts*, *Clara Stubbs*, and *Glory*. Besides their Orchids, Messrs. Veitch staged a number of new seedling *Polyanthi* *Roses*, one of which, named *Rito*, is a single-flowered variety coloured bright pink. A choice collection of the best seasonable shrubs in cut sprays was also shown by them. *Cornus Kousa* and *Escalonia philippiana* were noticed. Paul and Son, of Cheshunt, had also a group of cut shrub sprays, chiefly foliage shrubs.

At the north end of one of the tables *Lady Nina Balfour*, of Newton Don, Kelso (gardener, Mr. W. Wood), presented blush *Malmaisons* in pots, and the plants were really very fine. The blooms (and there were many of them) were large and good. Messrs. Bull and Sons, King's Road, Chelsea, staged *Dracænas*, three good sorts being their *D. Victorise* (yellow), *D. Coulingi* (white and green), and *D. Lord Roberts* (dark red). The Colchester firm of Messrs. B. R. Cant and Sons staged new *Roses*, among which we noted a pure white H.P. named *Frau Karl Druschki*, which ought to come well to the front, being so distinctive and otherwise good. Their semi-double crimson sort, the *Maharajah*, was much admired, and so likewise the new H.P.

*Ben Cant*, the famous Liberty, *Mrs. B. R. Cant*, and *Killarney*, which was shown to perfection.

Messrs. Clibran, of Altrincham, contributed a basket of their new *Lobelia* *Mrs. Wm. Clibran*, a deep dark blue with white eye, and very telling as a bedder for ribbon borders.

From Percy Waterer, Esq., of Fawkham, Kent, came close upon 130 vases of Sweet Peas, which were tastefully arranged with grasses and Fern, and the stand was draped with pale green muslin. Two handsome epergnes graced the ends of the long tabling devoted to the exhibits. We learn that about 100 varieties were represented, twenty of which are new varieties raised and flowered this year for the first time, and introduced last year by himself. Altogether something like 5,000 trusses of this useful decorative flower were staged.

Lord Rothschild, Tring Park (gardener, Mr. E. Hill), sent 160 plants of *Carnation Cœilia* in 7in pots bearing blossoms, many of which were between 5in and 6in in diameter. They were nicely arranged with *Pteris* Fern at the base, and the grass of the *Carnations* looked the picture of health. We have only one fault to find with this exhibit, and that is the plants were far too tall, many being nearly 5ft in height.

Messrs. T. S. Ware, Limited, Feltham, staged a very fine collection of hardy plants, including several alpinists. *Delphiniums* were represented in great variety, as were also *Phloxes*, *Campanulas* (one *C. persicifolia* *Moerheimii* being particularly handsome; it is a double white), *Geums*, and *Lychnis Haageana hybrida* (a splendid scarlet). Many others were staged, all of great merit and interest.

Messrs. Hugh Low and Co., Enfield, staged a group of miscellaneous plants, in which *Phœnocomma prolifera* *Barnesi* represented by a few specimens. *Trachelium cœruleum*, *Dracophyllum gracile*, with *Crimson Rambler Rose* and *Nymphæas* in trays, with Ferns in variety, were evidences of good cultivation of an interesting though small group.

### Fruit.

Messrs. Geo. Bunyard and Co., Limited, Maidstone, sent pot Cherries, the tree being in 10in pots, standing 3ft to 4ft high, and with sturdy, well-ripened shoots. Each bore a numerous complement of fruit clusters. In front of the trees were dishes of Cherry fruits, and we noted the following varieties:—*May Duke*, *Noir de Schmidt*, *Turkey Heart*, *Bedford Prolific*, *Waterloo*, *Florence*, *Governor Wood*, *Kentish Red*, *Windsor*, *Frogmore Bigarreau*, *Knight's Early Black*, *St. Margaret's*, and *Belle de Choisy*.

Gooseberry *Hönings Frieste*, which is not unlike our "Sulphur," came from Mr. J. Hönings, Neuss-on-Rhein, Germany, and a dish of well-preserved Apples—variety *Lord Beaconsfield*—from Mr. John Watkins, Pomona Farm, Hereford (who supplied the Apples to the King lately, we believe), received a vote of thanks. Nine fine *Queen Pine* Apples from Lord Llangattock (gardener, Mr. T. Coomber), The Hendre, Monmouth, were, as usual, of great interest. Mr. J. Crook, Ford Abbey, Chard, contributed *Dioli Amsden* Peaches gathered on June 26 from cool house trees. From Colonel Vivian's garden, at Reed Ashton, Trowbridge, Mr. Strugnell, the gardener, sent a fine fruit of *Melon Western Hero*, moderate in size, round, yellow in colour, and lightly netted. Messrs. Laxton Bros., Bedford, furnished a collection of Strawberries—The Laxton and Trafalgar in boxes, while Carter's *Endive Lettuce* came from Swanley Horticultural College. For an exhibit of Mushrooms (*Cuthberts' spawn*), Mr. Geo. Kelf, gardener at South Villas, Regent's Park, was awarded a cultural commendation.

### Medals.

FRUIT COMMITTEE.—Hogg Medal to Lord Llangattock, Hendre Gardens, Monmouth, for Pine Apples. Silver Knightian Medal to Messrs. Geo. Bunyard and Co., Royal Nurseries, Maidstone, Kent, for Cherries in pots and gathered fruit.

FLORAL COMMITTEE.—Gold for group of Sweet Peas to Mr. P. Waterer, Fawkham, Kent; Silver-gilt Flora for *Carnation Cœilia*, Lord Rothschild, Tring Park, Tring; Silver-gilt Banksian for hardy trees and shrubs, Messrs. Paul and Son, Cheshunt; for single *Petunias*, Mr. J. Surman, Beckenham; for hardy plants, Mr. Amos Perry, Winchmore Hill; for *Delphiniums*, Messrs. Kelway and Sons, Langport. Silver Flora for stove and greenhouse plants, Mr. J. Russell, Richmond; for *Malmaison* *Carnation*, *Lady Nina Balfour*. Silver Banksian for single *Begonias*, Messrs. Cannell and Sons, Swanley; for hardy plants, Messrs. Barr and Sons, King Street; for new *Pelargoniums*, Mr. H. B. May, Upper Edmonton; for cut *Carnations*, Messrs. Cutbush, Highgate; for hardy plants, Messrs. T. S. Ware and Sons, Feltham; for hardy plants, Mr. M. Prichard, Christchurch; for plants and Water Lilies, Messrs. Lowe and Co., Enfield. Bronze Banksian for *Delphiniums*, Mr. G. Ferguson, Weybridge.

ORCHID COMMITTEE.—Silver Banksian Medal for group of Orchids to Messrs. Hugh Low and Co., Enfield.

**Awards.**

*Alstromeria* Mrs. Salter (J. H. Salter).—A very fine form, with orange-red flowers. (Award of Merit.)

*Carnation Lady Carrington* (Martin R. Smith).—A large pink after the colour of Miss Joliffe, but much larger. (Award of Merit.)

*Delphinium Kitty Wardall* (Kelway and Son).—A double form, with shaded flowers and a fine spike. (Award of Merit.)

*Dracena His Majesty* (H. B. May).—A fine variety with broad leaves; copper, heavily edged bright red. (Award of Merit.)

*Lobelia coronopifolia* (J. Bennett Poë).—A large flowering blue Lobelia, growing about 2ft. high. (Award of Merit.)

*Polypodium iriodes ramocristatum* (W. Bull and Sons).—A fine form with crested tips. (Award of Merit.)

*Rose Frau Karl Druschki* (B. Cant and Sons).—A white Hybrid Perpetual of grand form and pure colour. (Award of Merit.)

**Richmond Horticultural, July 2nd.**

Notwithstanding the special effort at publicity made by the responsible officials of this Society, situated, as Leopold de Rothschild so happily says, "In one of the most beautiful parts of fair Surrey," the latest exhibition, on Wednesday week, was not all the success it was hoped it would be. First of all, the attendance was poor, showing that the Richmond folks are either worn-out with visitations and sight-seeing, or that the finer sense to appreciate the most beautiful in Nature has yet to be developed. We think it reflects discreditably on the public taste, and especially the local taste, when their own horticultural exhibitions are treated with indifference. Certainly the committee, the secretary, and others in connection with the society had made every effort to recoup the weak finances of the society, and their work has gone largely unrewarded. The show, too, was less in size than on former occasions, which is accounted for by the fact that on the same day the National Rose Society held their exhibition, and the Croydon folks also enjoyed their little display.

It was a singular thing that three such shows, so near to each other in London, should have been fixed for the same date. The wretched weather which prevailed until a couple or three weeks ago told heavily on the entries, and of course there are growers who will not show at all unless their plants and produce is up to the highest attainable standard, which is praiseworthy, though at times an effort or efforts might be turned in another direction, so that the show may not suffer through their absence.

Though Roses were hardly so good, yet such plants as Gloxinias and Begonias made it up somewhat, and certainly vegetables were exceedingly fine, while the cut flower classes and the non-competitive exhibits of hardy flowers were all very satisfactory. After judging, on the show day, the committee entertained the judges to luncheon, at which we were unable to attend. A pleasant gathering and meeting was recorded, with Mr. Skewes Cox, M.P., in the chair, and the Mayor of Richmond on his right.

Limitations of space debar us from expanding our report of the prizes awarded, or of the classes and the recipients. Messrs. F. Cant and Co., of Colchester, as intimated in our report of the N.R.S. Show in last week's Journal, were first for four dozen distinct Roses, with an even set of good blooms. Messrs. D. Prior and Son, also from Colchester, were creditable as second, the latter winning for the twelve distinct. The open Rose class awards, however, fell solely to these two entrants, and the name of Mr. R. E. West, of Reigate, was to the fore in twenty-four distinct in the amateurs, and also for the dozen. Mr. W. C. Romaine, an amateur rosarian, succeeded in taking firsts for the twenty-four and the twelve. Condensed, we give a further list of awards:—Group of plants arranged for effect: H. E. Fordham, Twickenham, first. Six Pelargoniums, distinct: Max L. Waechter, third. Six exotic Orchids, distinct: Sir Frederick Wigan, first. Six exotic Ferns (limited to exhibitors residing in the society's district): Sir F. Wigan, first; D. H. Scott, third. Six Caladiums, distinct: C. M. Bartlett, first. Nine Gloxinias: Max Waechter, first; C. M. Bartlett, second; Councillor J. B. Hilditch, third. A bouquet for the hand: W. Hayward, Kingston, first; Miss C. B. Cole, second. Most tasteful table decoration (open to lady amateurs): Miss C. B. Cole, first; Mrs. Noy, second. For semi-circular group of plants arranged for effect (open to amateurs and gentlemen's gardeners only): Sir F. Wigan, first; C. M. Bartlett, second. For twelve distinct varieties of Sweet Peas arranged in separate vases, with Gypsophila, Ferns, and other foliage: Mrs. Brewer, Suffield House, Richmond, first; Mrs. H. Michels, second; James Munro, third. For best collection of cut flowers, hardy herbaceous perennials, bulbs excluded (open to all exhibitors): Mr. H. L. Warde, Petersham, first.

**FRUIT.**—Best dish of Strawberries: Mrs. H. L. Warde, first. Best Melon: Sir F. Wigan, first; Mrs. Wigan, second; Justice Swinfen Eady, third. Nine Peaches: G. C. Raphael, first. Three bunches of Grapes (black): Earl of Onslow, first; W. E. Wells, second; L. J. Baker, third. Three bunches of Grapes (white): Justice Swinfen Eady, first; L. J. Baker, second. Twelve dishes of vegetables: Lord Aldenham, first; Colonel Bosworth, second.

Brace of Cucumbers: Mrs. Cooper Coles, first; W. H. E. Wells, second; Max Waechter, third. Dish of Tomatoes: Mr. Justice Swinfen Eady, first; Councillor J. B. Hilditch, second. Collection of six vegetables: Colonel Bosworth, first; Richard Keene, second; J. Harbird, third.

**SPECIAL PRIZES.**—For a collection of fruit, six dishes, distinct: G. C. Raphael, first; Mr. Justice Swinfen Eady, second; L. P. Baker, third. For twenty-four Roses, distinct: R. E. West, Reigate, first; Mrs. Noy, second. For most tastefully arranged basket of Roses: Miss C. B. Cole, first; Mrs. Franks, Kingston Hill, second; Miss Stepheni Hallett, St. Margaret's, third. For six plants in pots, suitable for table decoration (open to all exhibitors): Mr. Justice Swinfen Eady, first; H. Compton, second. For a single specimen Palm: C. Want. For a single specimen fine foliage plant: Sir F. Wigan, first; H. Compton, second. For six hardy Ferns, distinct varieties: D. A. Scott, first; Mr. W. Skelton, second. For a basket of plants arranged for effect: Mrs. H. L. Warde, Petersham, first; H. Little, second. For a single specimen of plant in flower: Mrs. Cooper Coles, first; Max Waechter, second. For six bunches of Sweet Peas, distinct varieties: H. Compton, first.

**National Rose, July 2nd.**

We were incorrect in reporting that no Gold Medals were awarded for new Roses at the Society's show last week. The official lists of award state that a Gold Medal was awarded to Messrs. Frank Cant and Co., Colchester, for their new H.T. Lady Roberts; and another to Mr. George Prince, Oxford, for new Rose Souv. de Pierre Notting, mentioned in the *Journal of Horticulture*, May 1, p. 381. The following medals were awarded for non-competitive groups:—Silver-gilt Medals to Messrs. G. Jackman and Son, Woking. Silver Medals to Mr. C. Turner, Slough; Messrs. Spooner, Woking; Messrs. Laxton Bros., Bedford; Messrs. G. Bunyard, Maidstone. Bronze Medal to F. R. Curtis, Esq., Colchester.

Mr. O. G. Orpen, Hillside, West Bergholt, Colchester, in the amateurs' section, had as fine a set of nine exhibition varieties in vases as any in the nurserymen's division. He was first in class 60, but no other prizes were awarded, though two more entrants showed.

**Southampton, July 1st and 2nd.**

The annual summer exhibition of the Royal Southampton Horticultural Society was held as usual on the Royal Pier, and was in every way a success.

Competition was keen in the majority of classes; while the exhibits left little to be desired. Roses and vegetables were especially well shown. In the latter department no less than forty-one exhibitors taking part in the six classes set apart for collections, making an exceedingly fine display of high class produce. As usual the arrangements were of a high order of merit, as is the case under the experienced guidance of Mr. C. S. Fudge, the secretary.

Plants were numerous. For a miscellaneous collection arranged as a central conservatory group, Mr. E. Wills, florist, The Nurseries, Winchester Road, Shirley, Southampton, was an easy first with a well blended arrangement of suitable plants—as Palms, Orchids, Lilioms, Geraniums, Ferns, &c. Mr. T. Hall, gardener to the president, Sir Samuel Montague, South Stoneham House, was a good second. The last named secured the leading award for four stove or greenhouse plants with well grown examples of Crotons, Ixora Williamsi, and Bougainvillea glabra.

Orchids were well staged by Messrs. Hooley Bros., Bitterne Park, Southampton, in the class for a group arranged for effect—Cattleya Harrisoni violacea, C. Warneri, C. Mossiae, with Odontoglossums in variety. Ferns were numerous and good. For four, Mr. F. M. Vokes, Birch Lawn, Sholing, secured the leading award; Mr. F. Cozens, Rownhams, second. Pelargoniums, Zonal Geraniums, and Gloxinias were very well shown by Mr. Hosey, gardener to J. C. D'Esterre, Esq., Elmfield Hill, Southampton, and Mr. Biggs.

**ROSES.**—Twelve classes were provided for these, and as the competition was keen the display was a good one. The principal class that for thirty-six blooms, distinct. Mr. Prince, The Rose Gardens, Longworth, Berks, secured the coveted award with an even stand of medium sized clean, fresh examples, the best being Souvenir d'Elise Vardon, Horace Vernet, Bessie Brown, Bridesmaid, La France, Marquis Litta, Duke of Edinburgh, Mrs. J. Laing, Marchioness of Dufferin, and Catherine Mermet; Messrs. D. Prior and Sons, Colchester, second; Mr. Rogers, The Bassett Nurseries, Southampton, third. Mr. Prince was again successful for twelve triplets, staging capital specimens of Marie Van Houtte, Maman Cochet, The Bride, Souvenir d'un Ami, Comtesse de Nadaillac, Souvenir de S. A. Prince, and Princess of Wales. Messrs. D. Prior and Sons followed closely for second place. Mr. Prince, with twelve Teas, was the most successful, with fully representative blooms of Mrs. E. Mawley, Bridesmaid, Maman

Cochet, The Bride, and Catherine Merimet; Messrs. Prior and Rogers following in the order of merit their names are given. For six blooms any one dark variety, Marquis de Litta won for Mr. G. W. Kent, gardener to Mrs. C. Croft Murray, Perivale, Ryde. Mr. Prince second with the same variety in good condition; four competing.

In the classes set apart for gardeners and amateurs there was brisk competition and a good display. For eighteen distinct, Mr. Kent easily secured the leading award with large fresh examples, of which La France, A. K. Williams, Helen Keller, and Suzanne Marie de Rodocanachi were the most prominent. Mr. W. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, was second with smaller blooms. Mr. Burden, gardener to G. M. Mellor, Esq., The Lodge, Bambridge, Isle of Wight, third. Mr. Neville had the best set of twelve Tea or Noisette varieties, staging Mrs. E. Mawley, Catherine Mermet, Marie Van Houtte, Niphetos, The Bride, and Anna Olliver. Mr. Kent second; Dr. D. Seaton, Lymington, third.

The most tastefully arranged basket of Roses was one contributed by Miss M. Snellgrove, Oxford Road, Southampton, a really charming combination of flowers and foliage. Miss

were remarkable for the quality of their flowers. Mr. F. Cozens, Rownhams, second.

Fruit was but sparsely staged. Mr. O. Eastwell, gardener to E. L. Walker Munro, Esq., Rhinefield, Brookenhurst, secured the leading award for two bunches black Grapes, staging medium sized, well finished examples of Black Hamburg. Mr. Bowerman, gardener to Lord Bolton, Hackwood Park, Basingstoke, second. Mr. Eastwell also secured the leading award for white Grapes. Strawberries were a feature of the show, so well were they staged. Mr. T. Hall won for two dishes: while Mr. J. Matthews, gardener to Mrs. Maltby, Sherecroft, Botley, won for one dish with exceptionally fine examples of Royal Sovereign.

Vegetables, as previously stated, were a distinct feature. In the class for six distinct varieties, prizes provided by Messrs. Toogood and Sons, seedsmen, Southampton, there were five entries. Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Herts, was an easy first prize winner with excellent examples of Wonderful Tomato, White Rocea Onion, Walcheren Cauliflower, and Southampton Wonder Potato. Mr. Davies, gardener to Lord Aberdare, Longwood House, Winchester, second; Mr. Bowerman third. In a similar class the

Holland Park Show—Blackmore and Langdon's Tuberosus Begonias. (See page 35.)

Wadmore, Brook House, Basingstoke, was an exceedingly close second. The last named had the most satisfactory arranged epergne, or stand of cut flowers, a combination that embraced good taste and effect.

Bouquets (bridal and ball) were best shown by Mr. F. Bailey, florist, Southampton, and Mr. E. Wills, 163, Above Bar, Southampton, both meritorious exhibits.

Hardy border flowers were an especial feature of the show, so well were they represented. For twelve bunches, Mr. B. Ladhams, The Nurseries, Shirley, Southampton, was a long way ahead of all other competitors, staging in his accustomed manner, so good was this exhibit that we give the names of all in the first prize exhibit. *Dictamnus fraxinella*, *Geum atrosanguineum* plenum, *Betonica superba* (very fine), *Iris gigantea*, *Coreopsis Eldorado* (an exceedingly fine variety), *Spiraea aruncus*, *Delphinium Navy Blue*, *Gaillardia maxima*, *Campanula persicifolia gigantea*, *C. p. Porcelain* (very fine), *Dianthus Abbotsfordiana*, and *Heuchera splendens*. Mr. T. Hall a good second.

Sweet Peas were also capitally shown. Mr. F. M. Vokes, Birch Lawn, Sholing, won first place for nine bunches arranged with their own foliage only, staging popular varieties, which

prizes offered by Messrs. Sutton and Sons, Reading, no less than seven competed. Here Mr. Gibson, gardener to R. W. Hudson, Esq., Danesfield, Marlow, succeeded in beating Mr. Beckett with a handsome exhibit of white Leviathan Onion, Magnum Bonum Cauliflower, Supreme Potato, Duke of Albany Pea, New Red Intermediate Carrot, and Perfection Tomato. In the second prize exhibit Mr. Beckett had superb Cauliflowers, Tomatoes, and Peas.

Trade exhibits added much to the interest of the show. Quite in the foremost rank of these was a huge bank of cut herbaceous flowers from Mr. Ladhams, comprising such subjects as *Gaillardias*, *Coreopsis*, *Delphiniums*, *Iris*, *Liliums*, *Pæonies*, and a splendid array of border Pinks in about six dozen bunches, for which Mr. Ladhams is famous.

Messrs. Rogers and Sons, Bassett Nurseries, Southampton, had Roses (in pots), shrubs and hardy flowers, all making an interesting exhibit.

Messrs. Dobbie and Son, Rothesay, had a huge bank of well grown Sweet Peas, Violas, and Pansies, including the bulk of popular, as well as many new varieties.

Messrs. Toogood, Southampton, displayed hardy flowers and annuals in great variety.

Mr. L. N. Newton, gardener to W. Garton, Esq., Reselands, Woolston, had a charmingly arranged group of Carnations, Gloxinias, Palms, Crotons, and Ferns, quite 20ft long and 8ft wide, as well as an additional group of well flowered Pelargoniums.

### Harrow Horticultural, July 8th.

With plenty of sunshine, and a fair breeze to boot, the Harrovians could scarcely help enjoying their delightful summer flower show on Tuesday last. The meeting place this year was in the grounds of Kennet House, where the little park and its surroundings are ideal for such an event. On the whole, the products exhibited were not beyond the average, if even up to it, but some splendid Roses were shown by the nurserymen. Our report is necessarily short, yet includes the best features. The officials of the Society do well, and their efforts deserve success. Besides the horticultural exhibition there are other attractions, such as a brass band, swing boats, and shooting galleries. The Harrow Horticultural Society was established in 1853, and is affiliated with the National Rose Society.

#### Roses, Open Classes.

The nurserymen's efforts here were of the greatest assistance, and a number of good exhibits were staged. In the class for thirty-six blossoms, distinct, the premier honours fell to Messrs. B. R. Cant and Sons, Colchester, with a fairly even set, including some good as well as some weak blooms. We name the collection as follows: Her Majesty, Ulrich Brunner, Mrs. John Laing, Marie Baumann, Mildred Grant, Gustave Piganeau, Caroline Testout, Marchioness of Londonderry, Lady Marie Fitzwilliam, S. M. Rodocanachi, Marchioness of Dufferin, and A. K. Williams. Second row: Le Havre, Papa Lambert, Comtesse de Ludre, Madame C. Ramey, Prince Arthur, Bessie Brown, Tom Wood, Innocente Pirola, Dr. Andry, Muriel Grahame, Duke of Wellington, and Mereville de Lyon. Front row: Helen Keller, Dr. Sewell, Madame Hoste, Jean Soupert, Fran Karl, Drunchki, Marchioness of Downshire, Madame G. Luizet, Xavier Olibo, Ulster, Reynolds Hole, Mrs. Cocher, and Dupuy Jamain. The second prize was awarded to Messrs. Prior, with strong blooms, which stood the warmth better than Cant's. Their best blooms were Souv. d'Elise, Charles Darwin, and Marie Verdier. The third award fell to Messrs. Paul and Son, with good representatives of Mildred Grant, Bessie Brown (best Rose in the show), and Mrs. W. J. Grant. The stands were all very fair, with few points to draw between them.

Mr. Geo. Prince, of Oxford, led in Class 2 for a dozen distinct Teas, with two or three good blooms, and the others poor for the exhibition standard. He had White Maman Cochet, Maman Cochet, The Bride, Golden Gate, Innocente Pirola, Bridesmaid, Souv. de S. A. Prince, Mme. de Watterville, Souv. d'E. Varden, Countess de Nadaillac, Muriel Grahame, and Mrs. E. Mawley. Messrs. Prior were second, and Messrs. B. R. Cant and Sons third.

Three collections of garden Roses were presented, and Messrs. Paul and Son were well ahead with a dozen distinct bunches. The heat soon affected these, yet the new Lady Battersea (H.T.) made a wonderfully fine show, also Marquis de Salisbury, W. A. Richardson, L'Innocence, Dawn, Camoens, Gustave Regis, Madame Ravary, and the little known Triomphe de Pernet Pere. The bunches were large and very fine. Second place was filled by F. Cant and Co., with fresh blooms, and Killarney, Marquis of Salisbury, Rubin, Boule de Nieve, and Madame Plantier were each very brilliant and beautiful. Third, Mr. Geo. Prince.

#### OPEN TO ALL AMATEUR GROWERS IN ENGLAND.

In Class 4, for two dozen Roses under this head, five good collections came forward, the leading exhibit coming from Miss Beatrice Langton, Hendon, who is doing well this season. She had one of the finest blooms of Mrs. W. J. Grant we have hitherto seen, and good flowers of La France, Madame Cusin (medal Rose in open amateur classes), Suzanne Marie Rodocanachi, and Madame G. Luizet. Mr. Edward Mawley was a good second, and contributed nice representative samples of Marie Baumann, Mrs. E. Mawley, and Mrs. W. J. Grant; third, Mrs. Adcock. Mr. Mawley carried off first honours for a dozen Teas and Noisettes, but they were indeed very weak, and the second place was filled by Mr. A. C. Turner, of Edgware.

#### OPEN TO MEMBERS ONLY.

The opening class here (No. 6) was exceptionally strong, so many as nine collections being staged, and Mr. Lewis S. Pawle was far and away superior here, both in quality of blooms and the manner of staging them. He included Marchioness of Downshire, Kaiserin Augusta Victoria, Her Majesty, La Fraicheur, Mrs. S. Crawford, Duke of Fife, Mrs. J. Laing (medal bloom), The Bride, Marquis Litta, Tennyson (new), and Suzanne Marie Rodocanachi, which was the best-coloured bloom of it in the exhibition. Mr. J. R. Cater was second, Mrs. Charles third. The other classes were fairly filled, but the staging of them left something to be desired.

#### Plants, Cut Flowers, &c.

In the other sections of the show the groups of plants from Mr. S. Gardner (W. Smith, gardener), which was first, and from Mr. J. N. Stuart (J. Fuller, gardener) second, were attractive features. Mr. J. N. Stuart led for four Begonias and Mrs. Charles was first for six exotic Ferns. The best six foliage plants came from Mr. Stuart, and the finest six plants in flower from Mr. T. Norman.

In the cut flower division for a collection of hardy border varieties the honours fell to Mr. A. E. Hargreaves, and many good lots were brought forward. Seven entered in Class 26 for twelve bunches of Sweet Peas, each sort distinct. Mr. S. Gardner was first, Rev. E. C. E. Owen second, and Mr. Lewis Pawle third. The display was highly interesting and creditable. In the succeeding class for six bunches of the same, Mr. A. K. Carlyon led and Mr. Grahame was second. Mr. S. Gardner beat Mr. J. T. Horley in Class 30 for a bouquet, the former having used pink Sweet Peas.

Fruit made but a minor show, the Strawberries being best, for a dish of eighteen Mr. G. A. Davis won against seven entries. Dr. Williams was first for Gooseberries and Mr. Hargreaves for Raspberries.

Vegetables were good on the whole, and a number of fine collections were on view. The first prize lot in Class 38 bore no name, and second Mr. F. Lovett and third Mr. Davis. For a basket of six kinds of salading Mr. Stuart had first.

#### Miscellaneous.

Mr. J. Lion, Stanmore, showed hardy plants in quality such as would do credit to any show, and well staged. Messrs. G. and A. Clark, The Nurseries, Dover, had also a good representative display, and Messrs. Paul and Son had cut shrub sprays and hardy flowers, while from Messrs. Cutbush and Son came cut Roses and Carnations similar in quality and variety to those noted by us at the Drill Hall.

### Croydon Horticultural.

At this show, owing to the numerous competing fixtures, Messrs. Cant did not exhibit as usual, but their absence was supplied by Messrs. Burch, who, in the open Rose classes, cut a very prominent figure. Mrs. Haywood was also a very successful competitor, and in the local classes Mr. W. J. Dart. Mr. C. A. Blogg had a remarkable collection of Cacti, and many fine plants were shown by Mr. J. R. Box and Mr. T. Butcher. Mr. Morris Prichard had a splendid lot of herbaceous plants, and Messrs. Cutbush some exquisite Carnations. A special feature of the show was the group shown by Mr. Bound, on behalf of Mr. J. Colman, which gained first place in its class. Mr. Shofield took the prize for the best Mrs. John Laing in the show, and the other winning blooms were the lovely La France and a Xavier Olibo. In the cottagers' classes there were many specimens of admirable quality both of fruit and vegetables.

**OPEN ROSE CLASSES.**—Forty-eight Roses, distinct: First, G. and W. H. Burch, Peterborough. Twenty-four Roses, distinct: First, G. and W. H. Burch. Twenty-four Roses, distinct: First, T. Butcher, George Street, Croydon. Twelve Roses, one variety: First, G. and W. H. Birch. Twelve Tea or Noisette Roses: First, G. and W. H. Burch. Thirty-six Roses, distinct: First and Challenge Cup, Mrs. Haywood, Reigate. Twenty-four Roses, distinct: First, Mrs. Haywood; second, Colonel T. H. Pitt, Maidstone. Eighteen Tea or Noisette Roses: First, E. M. Bethune, Horsham; second, Mrs. Haywood. Six Roses, distinct: First, Mrs. Haywood; second, Colonel Pitt. Twelve Roses, one variety: First, Mrs. Haywood; second, E. M. Bethune; third, Colonel Pitt. Twelve Roses, distinct: First, E. M. Bethune. Four Roses, distinct: First, E. M. Bethune. Nine Roses, distinct: First, Mrs. Lascelles, Sydenham Road North, Croydon; second, C. B. Crisp, Chichester Road, Croydon. Nine Tea or Noisette Roses: Third, C. B. Crisp. Six Roses, distinct: Second, Miss Thrall, Shirley; third, R. E. Mason, Vincent Road, Croydon. Six Tea or Noisette Roses: First, G. B. A. Shofield, Sutton; second, F. S. Rich, 18, Chichester Road, Croydon. National Rose Society's silver medal for the best bloom in classes 8 to 20: Mrs. Haywood.

**LOCAL ROSE CLASSES.**—Twelve Roses, distinct: First, Challenge Rose Bowl, and National Society's Silver Medal, F. W. Amsden, Chichester Road; second, C. B. Crisp; third, Mrs. Lascelles. Six H.P. Roses, distinct: First, W. J. Dart, Beulah Road, Thornton Heath; second, C. B. Crisp; third, Miss Thrall. Six Tea or Noisette Roses, distinct: First, Mrs. Lascelles; second, C. B. Crisp; third, F. W. Amsden. Six Roses, one variety: First, W. J. Dart; second, F. W. Amsden; third, F. S. Rich.

**OPEN TO ALL ENGLAND.**—Most tastefully arranged dinner table decoration: First, Mrs. W. H. Still, Addington; second, Mrs. A. C. Robinson, Wallington; third, Miss E. M. Robinson, Purley. Most tastefully arranged bouquet: Third, W. Collins (gardener to Alderman Barrow, Park Hill, Croydon). Twelve most graceful

plants for decoration: First, C. Lane (Mr. E. H. Coles, Caterham); second, G. Lewry (Mrs. Blake, Duppas, Hill Terrace).

**AMATEUR AND GARDENERS' CLASSES.**—Collection of Gloxinias: First, W. Collins; second, A. Martin (Mr. R. A. Thrale, Shirley Lodge). Cut Flowers, twenty-four varieties: First, C. J. Slater (Mrs. Haywood, Reigate). Twenty-four bunches hardy cut flowers: First, G. Lewry. Special prize new table decoration or table group: First, C. Lane; third, W. Collins. Twelve bunches Sweet Peas: First, J. Knapp (Mr. F. W. Amsden). Twenty-four cut blooms: First, J. Knapp; third, G. Prebble (Miss Thrale). Twelve bunches Gloxinias: First, G. Lewry; second, G. Prebble; third, C. Perrett (Mrs. Fuller, Dupas Hill). Six most graceful plants for table decoration: Second, A. G. Mason (Mr. F. S. Rich, 18, Chichester Road); third, C. Perrett. Twelve bunches cut flowers: First, C. Brooks (Dr. Reid, London Road); second, C. Perrett; third, A. G. Mason. Twelve bunches hardy flowers: First, J. R. Willis, 61, Avondale Road; second, C. Perrett; third, J. Eales (Mr. J. Glaisher, Heathfield Road, Croydon).

**FRUIT AND VEGETABLES.**—Three bunches black Grapes: First, H. Harriss (Mr. E. M. Bethune); second, W. Lintott, The Gardens, Marden Park. Three bunches white Grapes: First, W. Lintott; second, H. Harriss. Fifty Strawberries: First, W. Collins; second, W. Lintott. One Melon: First, C. J. Slater; second, H. Harriss; third, W. Lintott. Brace of Cucumbers: First, G. Prebble; second, G. Lewry; third, W. Collins. Six Tomatoes: First, W. Lintott; second, J. Johnson, Bramley Oak Gardens, Croydon; third, W. Collins. Dish of Peas: First, A. G. Mason; second, J. Johnson; third, F. Heading (Mr. C. B. Crisp, Chichester Road). Dish of Broad Beans: First, G. Edwards, Shirley; second, J. Johnson; third, W. Collins. Three Cauliflowers: First, W. Collins; second, C. Perrett; third, O. Jeal (Mr. N. Waterall, Waddon). Six Carrots: First, G. Edwards; second, W. Collins; third, J. Johnson. Six Turnips: First, G. Prebble; second, G. Edwards; third, C. Perrett. Six Beetroots: First, J. Johnson; second, G. Edwards; third, G. Lewry.

**SPECIAL PRIZES.**—Collection of salad: First, G. Lewry; second, C. Perrett; third, W. Collins. Most tastefully arranged flower stand: First, Miss Robinson, Purley; highly commended, A. C. Robinson, Wallington. Most tastefully arranged dinner table decoration: First, Mrs. R. Thrale, Coombe Road. Six gentlemen's buttonholes: No award.

**PLANTS.**—Six Caladiums, four varieties: First, G. Lewry. Specimen plant in flower: First, C. Lane. Specimen plant, ornamental foliage or Fern: First, C. Lane; second, G. Lewry; third, G. Eales. Six exotic Ferns, distinct: First, C. Walton, The Gardens, Seymour College, Whyteleafe; second, G. Eales; third, G. Prebble. Collection of cactaceous plants: First, A. C. Bogg, 65, Brighton Road, Croydon. Twelve Cacti, distinct: First, W. G. Child, 115, Frant Road, Thornton Heath. Twelve Succulents: First, W. G. Child. Six Fuchsias, distinct: First, G. Lewry. Six Coleus, distinct: Second, Mr. J. A. Spurgeon, Whitehorse Road, Croydon. Nine Ferns, distinct: First, G. Lewry; second, J. Galvin (Mr. H. Butcher, Purley). Nine Tuberous Begonias: First, J. Knapp, gardener to Mr. F. W. Amsden, 22, Chichester Road, Croydon. Six Fuchsias, distinct: First, C. Perrett; second, J. R. Willis, 61, Avondale Road, South Croydon. Group of plants: First, J. Galvin; second, G. Eales; third, C. Walton. Six Fuchsias, four varieties: First, C. Walton; second, C. Perrett; third, G. Eales. Six Tuberous Begonias, distinct: First, A. Martin (Mr. R. A. Thrale); second, A. G. Mason (Mr. F. S. Rich); third, C. Perrett. Six Ferns, distinct: First, J. Galvin; second, C. Stew (Mr. J. Chisholm, Addiscombe Lodge); third, A. G. Mason. Six Gloxinias: First, C. Stew; second, C. Perrett. Six Zonal Pelargoniums, distinct: First, G. Eales; second, A. G. Mason; third, C. Perrett.

At the conclusion of the judging the committee and officials dined together.

Mr. W. Gunner, who presided, after lunch proposed the toast of "The King." In proposing the health of the Judges, the chairman said they had been very fortunate in having three judges, two of whom they knew before, and one whose name was familiar throughout England, Mr. A. Dean. The weather had been diametrically opposed to horticultural arrangements, but in spite of the bad weather and of the National Rose Society's Show being held on the same day, they had a show of Roses. Mr. A. Dean, in reply, thanked them for coupling his name with the toast, and said he desired to render all possible praise to the committee for having got together such an admirable show. He congratulated them, too, on having their show in such a beautiful place. He trusted that the Corporation might be able to acquire it for the borough so that it should never pass into the hands of the builder. Hearty thanks having been passed to Mr. Reid for his kindness in lending his lovely grounds, the company adjourned to the show ground. In the course of the evening the prizes won in the cottagers' classes were distributed by the Mayor, accompanied by the Mayoress, and afterwards a vote of thanks to the Mayor was proposed by Mr. Gunner and carried with enthusiasm.

## Scottish Horticultural Association.

The monthly meeting of this association was held in 5, St. Andrew's Square, Edinburgh, on Tuesday evening, the 1st instant. There was a large attendance of members. After election of new members proposed at previous meeting, and the nomination of a number of candidates for membership, a paper was read by the secretary from Mr. Graham, Corstorphine, entitled "The Chemical Composition of Orchids and Their Culture." Mr. Graham's paper was of rather an abstruse nature, but was full of scientific information, and his cultural remarks, though brief, were of a most instructive character. A hearty vote of thanks was awarded to Mr. Graham, after a number of members had expressed their opinions.

Mr. Todd intimated the arrangements for the summer exhibition to take place on the 16th instant, and appealed to all horticulturists to assist in rendering the show a success by exhibiting subjects of interest.

There were a number of very interesting and beautiful exhibits on the table; the chief of which were, two vases of various Iris, chiefly German, from Mr. Comfort, president of the association, and were much admired. A very handsome and artistically arranged vase of Pyrethrum blooms was exhibited by Mr. Todd, containing a number of very best varieties for cutting purposes. Aphrodite was very fine, and is probably the best white in cultivation. James Salter was very bright. Mr. Todd also exhibited some beautiful Gaillardia blooms which were considered very early for the season. Also German Iris Princess of Wales, a very handsome pure white variety. Mr. Henderson, Whitehouse, Loan, exhibited a beautiful branch of Ceanothus dentatus pallidus, covered with beautiful bloom. Mr. Tate, Balcarres, Fife, exhibited beautiful spikes of Solanum Wendlandi; also a very handsome spike of Odontoglossum erispum, a very handsome spotted variety. Three vases of Fuchsia sprays were sent from Mr. Johnstone, Hay Lodge, Trinity. Mr. Grieve, Red Braes, exhibited Fancy Pansies and Violas, also stems of various interesting border plants, including the beautiful Heath-like Onosma taurica. The exhibitors were warmly thanked for their contributions.

The president referred in very feeling and appropriate terms to the tragic death of Colonel Ivison MacAdam, who had rendered very valuable services to the association, by his instructive lectures on chemistry, and suggested that an expression of regret be engrossed in the minutes. A vote of thanks to the chairman brought the evening's proceedings to a close.

## Metropolitan Public Gardens Association.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., the Earl of Meath, chairman, presiding, plan and estimate were submitted and adopted in reference to the laying out of a recreation ground in South Wandsworth, at the cost of one of the members of the association. Discussion ensued in reference to faculties granted by the Consistory Court of the London Diocese for the erection of buildings on churchyards, and it was stated that in the Holy Trinity (Stepney) case, in which the London County Council had applied for the revocation of such a faculty, whereby a public garden was being destroyed, judgment had been reserved. It was considered most important that every effort should be made to prevent the conversion of these valuable spaces into building sites, and it was decided to ask the London County Council to take steps, under the special powers they possess, to enforce the provision of the Disused Burial Grounds Act, prohibiting building on sites of this character. It was reported that Homefields Recreation Ground, Chiswick, in the acquisition of which the association had actively participated, had been opened to the public on June 13, and that the seats granted had been despatched. A report was received in reference to the proposed opening of St. Mary's and Walcot Squares, Lambeth, for the recreation of children. A letter was read from the Camberwell Borough Council stating that it had been decided to acquire a part of Grove Lane Board School site, and asking for the association's assistance in the laying out. It was decided to put in order the churchyard of St. Mary's, Whitechapel, provided the Stepney Borough Council undertook its maintenance as a public garden. Amongst a number of proposals under discussion were the formation of a riverside walk at Chiswick, the preservation of St. Peter's Square, Hammersmith, and of an estate at Upper Clapton, and the scheme of Mr. E. N. Buxton for the acquisition of some 300 acres formerly part of Lamborne and Hainault Forests at a cost of £27,000.

## Cheap Fruit.

Street hawkers in London have been selling Cherries and Strawberries at 2d. and 3d. per pound respectively, and Bananas at four a penny. Mangoes are on show in Covent Garden.

# THE BEE-KEEPER.

## Comb Honey.

There is nothing of a correspondence character in apiculture to equal the unblemished purity of the finest specimens of comb honey; this, together with the fact that during the last few years many improved methods and appliances have been invented for increasing its production has caused a corresponding increase in its consumption, until it is now a staple article of diet. Previously this alimentary treasure realised such prohibitive prices that it was a luxury enjoyed only by a privileged few. It is very difficult to obtain a large quantity from one hive as the liability to swarm is increased. The aptitude of the bee-keeper may therefore be estimated by his success in producing it consistently good, as unless it is properly finished it is of very little value. The greatest trouble in this respect is caused by giving too many sections. It requires considerable judgment and an accurate knowledge of the honey sources to give the requisite quantity.

Those who decide to work for sections will find the following suggestions serviceable:—Use full sheets of the thinnest worker base foundation obtainable and dividers between each row. The use of full sheets will induce the bees to enter and commence work more readily, which reduces the inclination to swarm and is of immense importance in the production of large quantities. It is necessary that queen excluder be used between the brood chambers and the supers. If fitted with a narrow frame of wood about half an inch thick all round and a piece across the centre it will be an improvement. This must be put on with the wood next to the frame, as in this position it provides a passage for the bees under the excluder, and consequently they have access through more perforations, and the hive will produce more surplus than when placed on flat.

No discriminating apiarist, I think, can fail to recognise that it requires a powerful colony to produce honey in quantity; therefore as soon as the hive is full of bees and brood, and the first signs of the honey flow are noticeable, viz., bees falling heavily on the alighting board, and the top cells of the brood-combs being lengthened, put on a crate of sections, and the workers will soon take possession and will fill them with beautiful comb. Add more supers as long as the season promises to hold out. Caution should be used in giving supers at first, not giving too much space, but gradually extending a little in advance of the bees rather than too late. It should be remembered that the bees also require a little extra room for ripening newly gathered nectar.

When the season is on the wane the super area should be diminished, and any partly-filled sections given to the most powerful colonies to complete. The season will then close with the minimum of unfinished sections, and the excellence of some is quite surprising. The bees will probably cluster outside after cramping, but no more room should be given. There is no danger of swarming. When adding racks of sections, if there is a probability of a continuance of the harvest raise the filled super to place the empty one underneath it. The duration of the honey flow must be correctly estimated, or, if it is checked, you will find the unexpected has happened—namely, the bees have carried the honey down below and retreated.

The question is sometimes raised. Why is there such a difficulty in inducing bees to enter racks of sections, and why have they at times such an antipathy for queen excluder? It is well known that bees work best where there is a large body of them engaged in a similar operation. For this reason they work better in frames than in sections. Heat is the secret, and this is not obtainable unless there is a large number of bees. If there is any difficulty in getting them to commence work advantage may be taken of this fact, and extracting combs given, and when once the working fever is created they will seldom afterwards swarm if sufficient room is given to keep them fully employed. The combs should be given first and the sections afterwards. It must, of course, be understood that it is absolutely necessary to have the brood-nest full and the supers wrapped up with some non-conducting material to keep them warm, which will encourage comb-building in the night. Bees cannot work properly unless they can raise and maintain a temperature of least 90deg, and this is impossible if the bee-keeper is negligent.

Bees may be coaxed into sections by various methods. Take a section from a colony where the bees are working in them, and place it with the adhering bees in the centre of the crate over the stock where they refuse to enter, and they will commence work immediately. This plan is always successful. Of course, these hints are given on the supposition that the bees are strong enough, and honey coming in, but still refuse to enter the sections. To have the sections in the best condition remove them as completed. The cappings are then very white and inviting. If left too long on the hive, they become darkened by

the constant stream of traffic, and their appearance injured. Before removing a rack of sections, draw a piece of fine wire between the rack and the top of the hive, to sever all connection. Should a comb become fractured and bleed, prop the super up slightly for a few moments, and the bees will clear the honey away. Robbers must be carefully excluded. After removal, carefully scrape them perfectly free from propolis, without cutting the wood, and grade them. Propolis is best removed by a glazier's knife. When clean, wrap in paper and tie neatly with string, marking each crate so that it may be easily ascertained where the different qualities lie without unpacking. It is not advisable to glaze them until wanted for sale; they will then look fresh and clean.

Comb honey producers are aware that there are always cells next to the side of the section partly filled with unsealed honey which, if the section is turned sideways, will run out and mar its appearance. The remedy for this is to store in a dry, warm place, 85deg to 90deg. Bees evaporate the moisture from honey by heat, and therefore we must obtain this artificially if we expect to keep it in good condition. Comb honey kept at this temperature gradually thickens, and improves in condition and appearance, instead of having the watery appearance usually found where it is kept in a damp, cool place. A cupboard near the kitchen fire is an admirable place during the winter months. It may be kept from one season to another in first-class condition.—E. E., Sandbach.

## Hardy Fruit Garden.

**PROPAGATING STRAWBERRIES.**—There are several methods of rooting runners, namely, in small pots filled with good soil or squares of turf, and pegged on small mounds of soil or prepared spaces between the rows. The method most convenient to the cultivator must be adopted, all requiring a certain amount of attention in order to carry out the rooting properly. If pots are employed, those 3 inches in diameter are the best. Drain them in a piece of thick turf, grass side downwards, and fill up the pot with a mixture of loam and rotted manure made firm. Select runners just emitting roots, and which are of a sturdy character, securing them on the pots with a peg or stone; keep thoroughly moist until established, when it is necessary to remove the pots to a hard base. Rooting on turves is similar. Cubes of thick turf about 3 inches square are the best. Place them grass side downwards after thoroughly soaking them with moisture, and secure the runners upon them, preferably with a hooked peg. Water should be given on every dry day. Runners will of themselves root into the soil between the rows, but if left alone there is usually too rank growth. Therefore clear out a large proportion so as to leave ample space for the selected runners. Should the ground be rough and unkindly, a little prepared material may with disadvantage be placed on mounds on to which the runners may be secured. A few spaces might with convenience be set apart for runners, but the rows must be fruitful, so that the runners are of a desirable kind. So long as crowding is not permitted very good plants may be obtained for general planting, but to obtain well-rooted plants early, which are readily removed and preserved until wanted for forming new beds, the pot system is the best.

**GOOSEBERRIES AND CURRANTS.**—The full flavour of the fruit is best secured by abundance of light and air, and to obtain this it is necessary to shorten the summer growths. The advantages of doing this are not only gained by the fruit, but the spurs bearing the fruit buds for the succeeding year are benefited thereby, inasmuch as the vigour and force which would otherwise be wasted in extending growth are concentrated in strengthening and improving the buds. Red and White Currants and cordon Gooseberries are referred to in the above hints. Bush Gooseberries as a rule do not need the shortening system in summer as required by spur pruning. The shoots pruned now may be shortened to about six leaves. Any growths apparently superfluous or unsuitably placed may be entirely cut out. Gooseberries have been freely thinned and the fruit used in a green state, the remainder can be allowed to ripen, helping the berries to swell to a good size by a liberal mulching over the roots. Currants, when ripe, may be netted over to preserve the fruit from birds.

**OUTDOOR VINES.**—Thin out and regulate the wood, stopping in the first place one joint beyond the bunch, and each

succeeding growth to one leaf as made. In addition to this treatment, it is desirable to lay in some young rods either to fill vacant places, or to take the room now occupied with old wood which probably needs removal. Vines are always benefited by an occasional refurnishing with young rods. The bunches must be thinned out to not more than one on a shoot, the berries also in each bunch being carefully and regularly thinned. Afford adequate supplies of moisture to the roots, this being an important matter in maintaining health, vigour and steady progress. With moisture thus present in the soil additional help can be given to aid the swelling of the berries, liquid manure proving most sustaining. To check rapid evaporation during dry, hot periods, a mulching of manure placed over the roots will prove beneficial. Copious waterings can also be given, over this with advantage.

**STONE FRUITS.**—If plenty of attention can be given to Plums, Cherries, Apricots, Peaches and Nectarines in laying in the summer growths so as not to be crowded, the fruits thinned to a number which the trees can properly carry without undue strain, the soil kept moist and the root fibres numerous and active, it is almost certain the fruit will swell to a fair size, be of good quality and ripen well. At the same time the wood for the succeeding year will gradually strengthen and ripen off. A little bonemeal or potassic and phosphatic manure mixed with good loam and applied as a top-dressing will be of great service to the majority of stone fruits, especially to those where the active state of the fibrous roots renders the trees in a fit condition to take advantage of the assistance.

**OUTDOOR FIGS.**—The young wood of Fig trees should be laid in in quantity sufficient to fill the vacant places, and no more. It is positively ruinous to crowd the growths, nor should they be shortened, but laid in at full length. The superfluous shoots cut out entirely. Abundance of fibrous roots near the surface will require a heavy mulching of manure. Occasional copious supplies of water will also be necessary in dry weather.—**EAST KENT.**

### Fruit Forcing.

**CHERRY HOUSE.**—After the fruit is gathered the chief object is to secure the plumping or perfect formation of the buds by keeping the foliage clear of every description of insect pest, syringing abundantly, and if necessary applying an insecticide. Red spider is the most troublesome, and must be suppressed, as it otherwise destroys the foliage; paraffin, softsoap, 8oz to 4 gallons of water, with loz of potassium sulphide added, is very effective against that and other pests, including parasitic fungi. Although less moisture is needed than when the fruit is swelling, yet there should be sufficient moisture at the roots to maintain the tree in a healthy condition. Trees in pots from which the fruits are gathered may be placed outdoors in the full sun, plunging the pots in ashes. Water as required to keep the soil moist, and syringe in the evening of hot days, paying particular attention to keeping the foliage free from pests.

**VINES.—IN POTS FOR EARLY FORCING.**—Cut-back Vines that were started early will have completed their growth and have the energies concentrated on the perfecting of the buds and the storing of essential matter for the support of the next season's growth in the early stages. The supplies of water, however, should be lessened, discontinuing syringing, or only having recourse to it occasionally, and moderating the supplies of liquid nutriment or water at the roots. Admit air freely, and afford all the light practicable to the principal foliage. If the canes do not ripen well keep through the day at 85deg to 95deg by moderating the ventilation and admit air freely at night.

**EARLY HOUSES.**—When the Grapes are cut the Vines should be well syringed to free them from such accumulations as dust and the invading hosts of such pests as red spider and thrips. If scale or mealy bug has obtained a footing, some approved insecticide should be used against them, or the Vines may be syringed with a mixture of paraffin oil and water, using a wineglassful to 4 gallons of water, one person syringing into the vessel so as to keep the oil well mixed with water whilst another individual applies it evenly to the Vines, it being important that they and every part of the house be well, but not excessively, wetted, for without that the eradication of the pests will only be partial. The application should be repeated two or three times at intervals of about four days, the free oil being far more effective than when emulsified, though not a safe application on young foliage, but quite innocuous to the Vines after the fruit is cut. Keep the borders sufficiently moist to preserve the foliage in good condition, it being better to mulch them lightly with partially decayed manure than to supply heavy waterings at frequent intervals to keep the soil from cracking. Allow a little extension of the laterals, as this tends to keep the roots active, and to preserve the principal leaves in health, or if these fall, prevents the starting of their corresponding buds.

**LATE HOUSES.**—Late Grapes, intended to hang or keep all the winter, should have a final thinning, removing the smallest berries, and where too crowded allow every berry full space for

development. Late Grapes should be more severely thinned than early and midseason ones, yet leaving sufficient berries to form symmetrical bunches, such as will retain their form when dished, and have a good appearance. Inside borders should be kept well supplied with water, afterwards following with liquid manure or a top-dressing of some approved artificial manure, and work in moderately. A light mulching of partially decayed lumpy manure, sweetened horse droppings being most suitable for heavy soil, and cow manure for light, poorer soils, would lessen the necessity for watering, and would attract the roots to the surface, and nourish them. Likewise outside borders must have attention for watering, feeding, and mulching as circumstances require. Regulate the young growths as needed, adopting the extension rather than the restrictive system where there is room for it without crowding, keeping all gross laterals stopped, so as to cause an equal flow of the sap throughout the Vines. As the period of scalding has arrived, though most common when the berries have completed stoning and begin changing for ripening, then taking the final swelling, it will be necessary to guard against it by increased night temperature, or 65deg to 70deg, and abundant ventilation, so as to reduce the atmospheric moisture or prevent the air heating more rapidly from sun heat than the berries. After the berries are advanced in colouring danger from scalding is past, then the fire heat may be economised by reducing the ventilation early, so that the sun may raise the temperature on fine afternoons to 90deg or 95deg.

**YOUNG VINES.**—The canes of this season's planting should, provided the light is not too much obstructed, be allowed to grow unchecked, it being presumed they are to be cut back to the bottom of the trellis, or to three buds for growth another year at the winter pruning, but the laterals must not be allowed to interfere with the leaves that feed the buds at their bases and expected to fruit next season. Supernumeraries, on the other hand, intended for next year's fruiting, may be regularly stopped at a length of 7ft or 8ft, pinching the laterals to one leaf as made, except those from the uppermost part of canes, which at the first stopping should be allowed a little more latitude. When growth is completed the laterals ought to be gradually removed, taking care not to start the main buds, so as to induce the thorough ripening of the wood. Afford water liberally, mulching and keeping the surface moist, so as to encourage surface roots. Maintain a moist atmosphere by frequent sprinkling of available surfaces, and syringe the Vines on fine afternoons, closing early to attain a heat of 90deg to 95deg. Ventilate freely through the early part of the day to ensure a short-jointed, thoroughly solidified growth.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

There were thunder-storms at the beginning of the week, since which time the weather has been warm and bright.

### Trade Notes.

The Corporation of Stockport have just accepted the design and estimate of Messrs. Messenger and Co., Limited, horticultural builders, Loughborough and London, for a large range of glass houses at Vernon Park.

The sale of the freehold estate known as The Hale Farm Nurseries, Hanworth, Middlesex, and of Crook Lodge, Crook Log, Bexley Heath, and two acres of land adjacent, utilised for Begonia culture, is announced, and will take place at The Mart, Tokenhouse Yard, E.C., on the 28th of July, at 2 p.m. For conditions of the sale apply at 67 and 68, Cheapside, London. E.C.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy—Competition.

In answer to a query from "A. B.," and in order to keep this before the minds of readers, we print below the rules for the Journal Bothy Plan Competition. It will be remembered that "Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**DOUBLE IRIS (F. A.).**—Purely a case of excessive vigour, and synchronous with fasciation in the Liliaceae. We have doubts as to whether it is "fixed," and at any rate it is ugly. Try the effects of planting and growing it in poor soil.

**MULBERRY SHOOT BEARING CATKINS (D. W.).**—The circumstances of the "falling-away of the male catkins" may have led our correspondent into error, for certainly the common Mulberry is monoecious as the shoots you send so well show, and our passing the statement was an unfortunate oversight. Of course the staminate flowers are purposeless after the pollination has occurred, whereas the female flowers give rise to fruit.

**ARTIFICIAL MANURE FOR VINES (J. Q.).**—In our issue of July 3 your queries were replied to, your letter having gone astray in consequence of its being addressed "The Editor" only instead of "The Editor of the *Journal of Horticulture*," other publications being issued from 12, Mitre Court Chambers. Clay's fertiliser, about which you inquire, is a good all-round artificial manure, and would help the Vines to finish their crops as well as assist them to store matter for the succeeding one. The query about weed-killer was also answered July 3, to "Idem," page 20. The weed-killers you mention are effective for their purpose, but we cannot undertake, for obvious reasons, to refer to any proprietary article in particular, unless under special circumstances.

**GROWING DAHLIAS FOR EXHIBITION (Young Beginner).**—Both Fancy and Show Dahlias require a rich, moderately heavy soil to give the best results, and should be stirred deeply and liberally manured. It is not, however, advisable to apply strong manure in spring, or over-luxuriance in foliage would thereby be encouraged at the expense of the production of flowers. A light, open situation, free from the shade of trees, is best, but surrounding shrubs or dwarf trees are often an advantage to Dahlias by protecting them from high winds. Planting should not be attempted before the beginning of June in most localities, and the plants should be stout, clean, and healthy, with one stem. A distance of 6ft should be allowed from plant to plant; water after planting, and apply a temporary stake to each for a time; afterwards place a stout stake to each plant and secure the main stem to it. When the heads commence forming reduce the growths to about four of the most promising, and securely affix these to the main stake by tying, or preferably secure each to a stake separately, for bundling will not do, as the foliage must have full exposure to light. On the shoots thus obtained there will appear flowers in due course. These must be thinned while quite young, leaving the central one on each shoot and removing the side buds. When these reserved buds are beginning to develop into flower they must be shaded from sun, and protected from rain, and in due course you will have good or bad blooms, according to the management. This we cannot describe—it is an art that must be learned, but we may say that Dahlias are much benefited by frequent applications of water during the summer, and by liquid manure after the buds are formed, the ground being kept mulched with short manure. The plants must be kept free from insect pests, especially earwigs, or they will spoil the foliage and also the blooms.

**PELARGONIUM SPORT (C. S.).**—We do not understand your letter. Is it that you do not know which is the variety Princess Alexandra and which the sport? We do not know the variety, as Pelargoniums are florists' flowers, which we do not attempt to keep up with. Send to Messrs. Cannell and Sons, Swanley. The flowers fall easily to pieces.

**GRUB-EATEN FRUITS OF MARIE LOUISE PEAR (North Riding).**—The Pears are infested by the larvæ or maggots of the Pear-gall gnat or Pear midge, *Diplosis pyrivora*, a small two-winged fly, which appears early in spring, commonly before the flowers of the Pear trees open, and remains about ten days. After pairing the female deposits her eggs inside the blossom envelope, when the Pear flower has opened sufficiently for the insertion of her long ovipositor. The eggs are placed at the base of the blossom and sometimes in the neck of the ovary, and in three or four days the eggs hatch into tiny maggots in the ovary of the embryo fruit, where they feed upon the growing tissues, and in consequence give rise to a gall. The effect is to destroy the core and ovules, and the maggots continue until full-fed, which occurs early in June in forward seasons, when decay follows, and the fruit either falls or cracks, and the maggots emerge, dropping to the ground. The maggots enter the soil an inch or two, and after resting awhile, make oval cocoons of silken threads, mixed with particles of earth. In these cocoons they remain apparently unchanged until the following spring, then change to pupæ, and after a month in that state the flies emerge, always by the time the Pear blossoms are in good colour, and have nothing to do but

**Pear Fruits Eaten by Grubs.**

await the expansion of the petals for inserting the eggs. These are seldom less than a dozen, and often many more in number, which means a corresponding number of maggots, so that there is no wonder they make such speedy work of the Pear. The preventive measures recommended are:—1. Catching the flies on strips of tin about 1ft long and 3in wide, smeared on both sides with a substance formed of one part sweet oil and two parts resin melted together, affixing the traps in the forks of the trees, or so that they will be level with or just above or outside the blossoms. The traps must be in position just before the flowers unfold, continuing for a fortnight. 2. Spray the trees with some "fine" smelling substance, such as tar water,  $\frac{1}{2}$ lb of gas tar being boiled for half an hour, or until it will readily mix with water, in two gallons of water, and then dilute to 50 gallons with water, applying just before the flowers open. 3. While the maggots are in the fruit, the removal of the affected Pears and burning them never fails. 4. When the larvæ have left the fruit, which takes place about the middle of June, later in backward seasons and in the open, but earlier against walls, supply a dressing of kainit, 10cwt. per acre, 7lb per rod, or 4oz (rather less) per square yard just after rain. The salt will be dissolved by the soil moisture, and the solution coming into contact with larvæ destroys them. In the case of cultivated land the kainit may be lightly pointed in. The most hateful thing to pests is good cultural methods that make for their disturbance and eradication. But when the garden or orchard so treated adjoins another garden or orchard that knows neither soil cultivation nor essential top management, all the labour will be in vain, as the Pear-gall gnats are bound to find their way from the neglected to the cultivated trees. In the *Journal of Horticulture*, June 3, 1897, page 486, is an article by Mr. G. Abbey on this pest, and on page 487 of the same number are illustrations showing the life history of the Pear-gall midge.

**MEALY BUG IN VINERY (H. H.).**—The best means of getting rid of mealy bug in a vinery where the Grapes are just stoning is by vaporisation with nicotine compound, repeating two or three times at intervals of about four days. It must be borne in mind, however, that the vaporisation will injure the foliage of Lady Downe's and Muscat of Alexandria, and should not be practised in vineries where these varieties of Grapes are grown. The only other safe method to follow with the Grapes swelling or ripening is to go over the Vines and touch each mealy bug or seat thereof with methylated spirit, just a tiny drop sufficing to destroy the pest, and as a rule it does not injure the Vines. To eradicate the mealy we have found syringing with a mixture of paraffin oil and water, a wineglassful to four gallons of water, one person syringing into the vessel and another applying it to the Vines, thoroughly wetting every part of them and the house, answer well. This can only be done after the Grapes are cut, and should be repeated two or three times at intervals of a week.

**GRAPE STEMS AFFECTED (J. R. P.).**—The stems are shanked and the berries are scalded. The shanking appears very decisive, and is usually caused by the roots of the Vines being in soil much too close, rich, and wet, for which the best remedy is lifting the Vines and laying the roots in fresh and more open material nearer the surface. Sometimes, however, a dressing of lime, preferably air-slaked, and applied to the surface at the rate of 2lb per square yard, either lightly pointed in or left on the surface if not objected to, effects wonders, for some of the lime is constantly being dissolved, and passes into the soil with rain water or that applied in watering, and corrects the soil's sourness, while rendering other substances more readily available as food. Indeed, we have known a 2in thickness of lime in a Vine border restore Vines to health, the roots coming up into the soil just beneath and even into the lime. For the scalding there is no remedy, but it may be avoided by ventilating freely, leaving a little air on constantly, and increasing the ventilation early in the morning, so that the berries may heat evenly with the surrounding air, moisture not then condensing on them, and being heated by the sun or surrounding air, scalded. Also keep a gentle warmth in the hot water pipes.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (H. K.).—1. *Prunus Padus*, the Bird Cherry; 2. *Cotoneaster acuminata*. (W. W., Roxburgh).—*Paneratium illyricum*. (T. H.).—*Acridocarpus natalitius*. (J. B.).—1. *Sedum anglicum*; 2. *Sedum aere*; 3. *Fuchsia macrostema*; 4. *Allium roseum*; 5. *Spiraea decumbens*; 6. *Lactuca perennis*. (F. Mallis).—1. *Campanula garganica hirsuta*; 2. *C. carpathica turbinata*; 3. *C. pulla*; 4. *C. glomerata*; 5. *Spiraea lancifolia*, syn. *Haequetia*. (L. F.).—*Anemone rivularis*. (T.).—1. probably the "Garden" Rose, *Annie of Gierstein*; but send to a grower. (N. B., Hamilton).—1. *Phlox ovata*; 2. *Spartium junceum*; 3. *Genista dalmatica*; 4. *Solanum Wendlandi*; 5. *Trachelium caeruleum*; 6. *Torenia Fournieri*.

**Special Note.**—When sending newspapers containing paragraphs intended for the notice of the Editor, it would very greatly gratify him, and save time, which the Editor feels precious to him, were the paragraphs distinctly marked.

## The Sole Topic of the Hour.

We may be pardoned if we digress for a moment. Even the weather hardly interests us now. We do not go to the local post office to read the weather forecasts. We go to read how the fight is progressing between two great powers, the King of Terrors and the ruler of this vast Empire. Our hearts have been touched as they have never before been touched for the last century, nay, we may say for longer than that. We had come within a few hours of the great day, the day that was to see our monarch crowned, when, without practically the slightest warning, fear and trembling fell on each heart, and we stood still to wait and see what God would do. No one, we firmly believe, can put into words the awful sensation that came over the nation when the terrible news was flashed forth throughout the English speaking world. The case was without parallel. The King—our King—in grave danger! Our first thought was for him; our second for that Gracious Lady whose heart was being wrung with agonising sorrow. As we write we know full well that under the most favourable conditions recovery must be long and tedious; but we cannot but hope that in answer to the fervent petition of the nation the Almighty will hear the prayer, "God save the King!"

As we have noted before, Edward VII. really may lay claim to being the King of Agriculturists, as well as the Empire's Monarch. Four times has he been President of the Royal Show, and many are its exhibitions he has attended, not because he knew that his presence did so much to add to the gate receipts, but from a pure love of things agricultural. We may venture to say that the King has passed no happier days than those at Sandringham among his pedigree stock. He did not confine himself to one branch. Of course,

horses came first, and although we should omit his racing stud, we may fairly mention the Shires and Hackneys. At every great sale may be seen representatives from Sandringham on the look out for anything of special merit, and as a consequence the stock on the Home Farm was kept up well to the mark. Shorthorns were made a speciality, and when, as King, the Windsor farm became his, his sphere of agricultural usefulness was largely increased. Prince George appears to be following in his father's footsteps, and we can but hope that he will go to Carnsle with a mind entirely at ease respecting the health of his noble father.

What grumblers we are! The excessive rainfall did not suit us, and now this tropical sunshine is equally calling forth censure. The fact is, the ground got so sodden, and then baked hard, that small plants find a difficulty to exist. It is perfectly marvellous where the moisture has gone, but these high winds are in a measure responsible. The country had indeed put on Coronation garments. The summer must be a short one; it began so late. But autumn days may have much in store for us, days of sweet warmth and genial airs.

We often see that excellent paper "The North British Agriculturist," and it is a most unusual thing if there is not in its pages much to edify and amuse. There is, as many readers may know, a National Diploma in Agriculture to be gained by examination. The men who gain this distinction are to be the future teachers, and the report this year says of them that, though their knowledge of the subjects on which they were examined was good, yet, when it came to spelling, grammar, and English composition, they were found to be sadly wanting. Well, if these men can in practice make farming pay, we should care very little whether they could spell or not. The balance on the right side at the end of the year is of more account than English composition. The composition farmers know most of in these latter times has been that which they have made with their creditors. Of course, there is a prejudice in favour of correct spelling, but we should have thought that, as all boys must at least stop at school till they are fourteen, that these little difficulties had been overcome years ago. Where, we think, these diploma gentlemen fall short, is in practical knowledge. We should like to set them on a strong land farm, or blow-away Norfolk sand, and then ask them to make a living as per agricultural handbook. Things work out beautifully on paper, but paper farmers never can compete with the practical man, and the practical man is not made in two or three years. Farming is a life study.

Primrose McConnell, one of our best living authorities on farming, said in a speech only a fortnight ago that when he left college he had all the degrees in agricultural science that could be got, that he had tons of agricultural literature, and that he would willingly sell them all very cheap for all the good they had done him as a practical farmer. We want more practice and less theory. A cookery book is no use to a cook unless she will work out to a successful issue the recipes therein contained, and all the handbooks to the farm are of no use if simply learned off by rote. Any intelligent child can do that. We like to see a man with toil-hardened hands, and boots that might crush clods.

Much wisdom may often be condensed into very few words, and we came upon two instances to-day in our reading. Professor Wrightson, of Downton, summed up under three heads the essentials for successful dairy work. First, cleanliness; second, cleanliness; third, cleanliness. The three essentials for good farming are: first, muck; second, muck; third, more muck. We have heard an old Yorkshire saying: "Muck in, wicks out," wicks being what in most other counties are called "twitch." Clean land in good heart will grow satisfactory crops.

We often hear complaints from old-fashioned dairy folk about the difficulty they have in getting butter; i.e., they churn for hours with no practical result. All sorts of causes are blamed, the weather, the temperature, the cows the churn, and so on. To churn butter satisfactorily there must be air in the churn, and there cannot be sufficient air if the churn be too full of cream. We know exactly how it happens. There is an extra quantity of cream, and the question arises, Shall I divide this, or churn it all at once for the sake of saving time? And the result is a weary business brought to a very unsatisfactory conclusion. A good rule is to only half fill the churn, and ventilate frequently. All

books or directions for dairy work frequently repeat this axiom, but people will not stay to consider the why and the wherefore.

Sometimes the cream gets "sleepy"; that is, it thickens and sticks to the sides of the churn. Add either water or skimmed milk at the temperature of 60deg, and the butter will presently come. Remember the cream does not want so much violence; a steady, even beat and plenty of air. If butter does not come easily in winter, the low temperature of the cream is generally at fault.

### Work on the Home Farm.

A very fine and hot week has been most favourable for those early birds who had anticipated it by cutting down their Clover, and these fortunates are now literally "in clover," having fine piles of well saved fodder in the yards, whilst their more dilatory, or, to be charitable, less fortunate neighbours, are to-day watching a steady downpour upon their recently shaken out swathes. From other aspects than that of haymaking, to-day's rain will be most beneficial; the change from watery to dry conditions had been too sudden, and both cereals and roots would, without rain, have soon been hanging out signals of distress.

The heat has favoured the sowing of the late breadths of Turnips which are now all in the ground, and some of them already up again. All hands have been well employed, the Clover was quickly got, and happily so, for there has been ample employment for all amongst the Turnips with either horse or hand hoes. The Mangold crop, too, is in need of further looking over. The seed grew so well this year, and produced so thick a plant, that there are more doubles than usual. These must be singled down to the best plant. Single roots with a fair amount of room produce much the greatest weight per acre, and everyone tries for the big heap nowadays.

The alternations of heat and moisture have sorely multiplied the labours of the shepherd, who, since clip day, has been enjoying a well-earned easy time. The fly has never been less troublesome in June, but now that the temperature has become more summer-like, it is simply rampageous, and a flock of 200 ewes and their lambs constitute a breeding ground quite large enough to occupy one man's whole time in keeping it clear of maggots. There are many recipes for killing the maggots, but few of any value in preventing other attacks, but finely powdered tobacco dredged on a sore place will prevent the fly striking there again.

The owner of our local set of steam cultivators, informs us that he is full of orders for breaking up seed pastures before harvest; he is now at work on a field to be sown with late Turnips. The farmers who employ him will be themselves employed in hay-making, whilst he is making hay of their twitch. We can almost hear someone say they ought not have any of that noxious weed, but Nature abhors a vacuum, and when there is little Clover it has a way of filling up the spaces with twitch in a miraculous manner.

### Webbs at the Royal Show.

On entering the showyard the first object was the imposing stand of Webb and Sons, of Wordsley, Stourbridge. This firm has been for many years engaged in the improvement of plants by means of cross-breeding and selection at their celebrated Kinver seed farms, and their experiments have been frequently inspected by many agricultural authorities. A prominent exhibit was the new and improved varieties of Wheat, Barley, and Oats, which have been introduced by this firm, and a comparison of the quality and productiveness of these highly selected stocks with that of the old varieties shows the improvement effected by Messrs. Webbs' scientific operations. Noticeable among these were Webbs' New Mont Blanc Wheat, Webbs' New Standard Red Wheat, Webbs' New Hardy Winter Black Oat, and Webbs' New Burton Malting Barley. Plants in growth represented Webbs' Grass and Clover seeds for permanent pasture and alternate husbandry. Recognising the increasing tendency of agriculturists to grow vegetables for market, this firm exhibited a selection of the most suitable kinds to grow for profit. These included Webbs' New Pioneer Pea, Prize-winner Carrot, Exhibition Cos Lettuce, Emperor Cabbage, and Early Mammoth Cauliflower. About twenty plants of the new Tomato, Webbs' Coronation, are also shown, the handsome fruit hanging in great profusion, and commanding universal admiration. In the flower section, Webbs' Excelsior Gloxinias made a grand show, although consisting merely of plants grown for the production of seed. Amongst named varieties were Webbs' Stanley (vivid crimson), Peerless (white), and Purple Queen. Webbs' Gloxinias were awarded the Royal Oxfordshire Horticultural Society's Gold Medal last week. About 120 varieties of Sweet Peas were also shown, including several novelties, grown in Webbs' experimental grounds. Messrs. Webb are probably the largest manufacturers of artificial manures in the kingdom, their special fertilizers having proved so successful in promoting the growth of heavy crops that many thousands of tons are now annually sent to all parts of the kingdom from their works at Saltney, Chester.

# WEBBS' EMPEROR CABBAGE

MAINTAINS ITS PRESTIGE AS

BRITAIN'S GREAT CABBAGE.

Awarded Highest Honours at all the Leading Shows in the Kingdom. The hearts are large, very uniform in shape, exceedingly solid, and of remarkably fine flavour. It is acknowledged to be

*The earliest & best Cabbage in cultivation.*

6d. and 1/- per pkt., 1/6 per oz., post free.

WEBBS', WORDSLEY, STOURBRIDGE.

## Grand New Climbing Rose DOROTHY PERKINS.

The Floral Committee were unanimous in giving this an AWARD OF MERIT when shown by me at the Royal Horticultural Society's Meeting at the Drill Hall, on May 20th.

*See Report in this Paper of May 22nd.*

This beautiful novelty is a hybrid between Rose Wichuriana and Madame Gabriel Luizet; the flowers are produced in large clusters of a lovely shell-pink with white centre. Besides being a good climber, it can be grown as a fine pot plant.

Orders booked now for autumn delivery, which will be executed in strict rotation. Good plants in 48-pots, 3/6 each; extra strong, in 24's, 5/6 each.

Special List of other New Roses on application.

**E. POTTEN,**  
Camden Nurseries, CRANBROOK, KENT

## CHOICEST STRAINS OF FLOWER SEEDS

FOR PRESENT SOWING.

DICKSONS SUPERB PANSY, 1/-, 1/6, and 2/6 per Packet. Giant and Gold-Laced POLYANTHUS, each, 1/- per Packet. Mixed Alpine AURICULA, 1/- and 1/6 per Packet. Extra choice Stage AURICULA, 1/6 and 2/6 per Packet. ANTIRRHINUM, 3d., 6d., 1/-, and 1/6 per Packet. AQUILEGIAS, 3d., 6d., and 1/- per Packet. [Packet] CANTERBURY BELLS, double and single vars., 3d. & 6d. WALLFLOWERS, single and double vars., 6d. & 1/- Packet. CINERARIAS, 1/6, 2/6, and 3/6 per Packet. MYOSOTIS, 3d., 6d., and 1/- per Packet. PRIMULAS, 1/6, 2/6, and 3/6 Packet. VIOLAS, 1/- Packet. **DICKSONS ROYAL SEED WAREHOUSE, CHESTER.**

## RIVERS' FRUIT TREES, Roses, Vines, FIGS, ORANGES, AND Orchard-House Trees.

A LARGE AND SELECT STOCK ALWAYS ON VIEW.

ILLUSTRATED AND DESCRIPTIVE CATALOGUE,  
Post Free, 3d.

**THOMAS RIVERS & SON,**  
SAWBRIDGEWORTH, HERTS.

HARLOW STATION, G.E.R.

No. 1151.—VOL. XLV., THIRD SERIES.

FOR THE COMING SEASON.

## CLIBRANS CHOICE BULBS.

OUR BULB DEPARTMENT has been an important feature of our business for many years. It has been our constant endeavour to supply only the very highest class of both home-grown and imported bulbs.

We specially invite attention to the following:—

*Choice Roman Hyacinths*  
" *Named Hyacinths*  
" *Single & Double Tulips*  
" *and Select Narcissus*  
" " *Liliums*  
*Retarded Lily of the Valley.*

CATALOGUE ready early in August.  
Gratis and Post Free.

**ALTRINCHAM & MANCHESTER**

## HARDY WATER LILIES AND OTHER AQUATIC PLANTS.

Great Speciality.—New and Old beautiful varieties delivered by Parcel Post during the Spring and the Summer, which are the best seasons for planting them.

**B. LATOUR MARLIAC, Nurseryman,**  
TEMPLE - SUR - LOT (Lot-et-Garonne), FRANCE  
Lowest Prices. Catalogue free on application.

## LONDON FERN NURSERIES,

LOUGHBORO' JUNCTION, LONDON, S.W.—Stove and Greenhouse Ferns, large and small, in var., Aralias, Grevilleas, Cyperus, Ficus, Ericas, Palms, Dracenas, Aspidistras, Roses, Azaleas, Carnations, Crotons, Camellias, Chrysanthemums, Cyclamen, Bouvardias, Asparagus, Araucarias, Solanums, Aspidistras, Cinerarias, Genistas, Marguerites, Geraniums, Primulas, Orange Trees, &c. Trade, send for Wholesale List. Special Retail Catalogue, free.—**J. E. SMITH.**

**CUTHBERTS' SPECIALITE MUSHROOM SPAWN.** New Spawn now ready. We continue to receive the most gratifying testimonials as to the productiveness and good quality of our Spawn. Per bushel, 5/-. —**R. & G. CUTHBERT, Seed and Bulb Merchants,** Southgate, Middlesex.

**PROTECT YOUR FRUIT.**—Tanned Garden Netting, 25 by 8 yards, 50 by 4 yards, 100 by 2 yards, 8/- each. Prompt delivery. Only best quality supplied.—**L. WREN & SONS, Net Merchants,** 139, High Street, Lowestoft.

**PURE WOOD CHARCOAL,** Specially Prepared for Horticultural use. Extract from the *Journal of Horticulture*: "Charcoal is invaluable as a manurial agent; each little piece is a pantry full of the good things of this life. There is no cultivated plant which is not benefited by having Charcoal applied to the soil in which it is rooted." Apply for Pamphlet and prices to the Manufacturers—**HIRST, BROOKE & HIRST, Ltd., Leeds.**

**RICK COVERS** (quite new, all sizes), 6 by 6 yards, 21/-; 7 by 6 yards, £1/4/6; 8 by 8 yards, £1/17/4; 10 by 10 yards, £2/13/4, or any size to order at 7d. per square yard; good hemp rope fitted, great quantity in stock, ready to be despatched on receipt of order; carriage paid.—From **H. J. GASSON, Government Contractor,** Rye.

**HEATING APPARATUS** for Greenhouses and other Buildings. Catalogue free of all kinds of Hot-water Pipes, Wrought and Cast Iron Boilers, Radiators, Cisterns, Pumps, Baths, &c.—**JONES & ATTWOOD,** Stourbridge.

**FOWLER'S MEALY BUG DESTROYER** effectually and instantly destroys this most troublesome pest without stain or injury to the foliage. In bottles, 1/-, 2/6, 5/-, and 10/- each. Sold by all Seedsman. **CORRY & CO. (Limited), LONDON, E.C.**

## Journal of Horticulture.

THURSDAY, JULY 17, 1902.

### Gardening Societies.

**N**APOLEON Bonaparte spoke of "perfidious Albion" as being a "nation of shop-keepers." If he had lived at the beginning of this century, instead of last, he might truthfully have called us a nation of gardeners, and we should have forgiven him. Nothing is more striking in the country's history than its horticultural advances. In a business sense, gardening has grown to be a vast industry comprised of many branches; as a science it has advanced by leaps and bounds, and gardens to-day are enriched, not only with the natural production of other lands, but by forms of flowers, fruits, and vegetables that are the direct result of human skill in hybridising and crossing. And as horticulture has developed, so, also, has the love for it.

As a business, gardening is a strong power in the land; but as a hobby, I think it is still greater. Men and women of all grades of society pursue the gentle art for the sake of the pleasure they derive from it; some amid the pleasant surroundings of country mansions, some on the plots of ground where stand suburban villas, others in the back-yard gardens of towns, and others again in the cottage gardens and allotments of rural villages. The conditions and circumstances under which gardening is pursued differ widely, but in all cases there is the same love for horticulture, and this is the motive power of the whole movement. As a rule, amateur gardeners are the most unselfish of men, and love to share their joys and sorrows with their fellows. In fact, you cannot fully enjoy a garden alone; and what gives greater pleasure than to have a friend of gardening bent drop along for a chat just when you have some favourite plant in bloom,

**R**EADERS are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "**THE EDITOR**" at **12, Mitre Court Chambers, Fleet Street, London, E.C.**, and to no other person and to no other address.

or a particular crop just at its best? Gardeners always talk shop, but they are never aware of it, because to them there is no other topic half so pleasant, neither does it seem possible to take a keen interest in horticultural matters without having some genial spirit to share it with you. Perhaps it is this mutual tendency to be sociable that first led to the formation of horticultural societies about which I have a few words to say.

First of all there is the Royal Horticultural Society with its far-reaching influence, which embraces gardeners of all classes; then there are the societies of provincial centres, such as Shrewsbury, York, and Hanley, that hold magnificent shows every year; and, thirdly, the societies devoted to the welfare of particular flowers, such as the Chrysanthemum, the Rose, and the Dahlia. We know all about these institutions, gardening papers tell of their doings week by week; but there are hundreds of other societies scattered over the land that make no bid to fame, beyond an occasional paragraph in the local newspaper, and yet it is impossible to over-estimate the amount of good they are doing in the world of horticulture. The village society holding its annual show is, comparatively speaking, an old institution; but in the suburbs of every town of size the gardening spirit moves, and of recent years societies have sprung up, at the meetings of which knowledge is distributed, and the productions of the members are displayed.

Perhaps the chief aim of the rural gardening society is to have an exhibition, and in many a country village the event of the annual show is a red letter day of the year. There is scarcely need to describe it, for who has not been to a village flower show? Generally on the same day, and in the same field, the tent appears. You observed the horny-handed workers proudly stage the produce that has cost them many an hour of toil and care, you note the comparisons they make, and the decisions they arrive at before the judges allot the prizes, and afterwards you observe the eagerness with which they enter the tent to learn their fate. In the afternoon the band plays, the villagers, from the lord of the manor downwards, flock in between then and evening, and stout lads and winsome lassies trip the fantastic toe on the green turf. Such is the village flower show day, a time of absorbing interest to the gardening element, because it is the culmination of earnest effort, a day of healthy recreation and amusement to the villagers, and an event to be remembered till the time again rolls round for the next show. It is only those who are acquainted with village life and village gardening who can estimate the benefits derived from the institution of the flower show. I have watched their progress in many instances, and have observed the interest they have aroused. In every village there is a community of persons interested in gardening, and they only want stimulating.

The flower show has this effect, the spirit of competition asserts itself, enthusiasts vie with each other in friendly rivalry, and the general standard of gardening is raised in consequence. Exhibitors soon learn that to gain honours they must not only grow crops well, but they must grow the best forms. This prompts them to make a study of varieties, to search catalogues, to read horticultural literature, and to add to their stock of knowledge by every means possible. This all tends to improvement, and if a census could be taken of the best village gardeners in the country it would be found that they are mostly members of horticultural societies.

In some instances amateur societies are instituted for the sole purpose of running an annual show; but in such cases an element of general usefulness is lost. A gardening society should be one of mutual improvement, and this can hardly be the case when a show is held once a year, and the members rarely come into contact with each other except on these occasions. The tendency is to think too much of growing for the show alone, exhibitors are apt to grow mercenary, jealousies creep in, and these things have been the downfall of more than one society. In many country villages in the South of England the society is managed on different and better lines. There is the annual show, of course; but in addition to that the society has its headquarters, where meetings are held monthly, and in some cases fortnightly. Seasonable produce is staged at the monthly meetings, for which points are given. A record is kept of the latter, and at the end of the year prizes are given, the amounts varying according to the financial position of the society. To prove that prize money is not the sole aim of village gardeners, I could point to instances where men have exhibited regularly at the monthly

meetings and at the annual show, and through bad weather or other circumstances they have not received a penny in reward. But they have not withdrawn their support, and to their credit have kept on exhibiting just the same. In most cases the society is able to guarantee the prize money; but not in all, and I have known wet days to dash the hopes of the exhibitors entirely, though they have accepted the situation cheerfully, and worked unitedly to recoup the loss to the society.

The monthly meetings are interesting gatherings, and through them the members are kept in frequent touch with each other. Reserve is forgotten when they sit round the meeting room, and through the discussion much useful knowledge, founded on experience, is dispersed. In some instances arrangements are made for papers to be read, or lectures to be given, which adds greatly to the interest, and though the working cottage gardener is not much for public discussion, he is a profound listener, and in his quiet moments on his own little plot he proves by practice what he learns by precept in the meeting room. Further, it is worthy of notice that many of these societies are not run by influential persons under patronage. They are started and managed by the working men themselves, with as much financial support as they can get from outsiders. They may aim at no great things, in the eyes of some they perhaps appear to be conducted on monotonous lines; but the village gardening society has to move slowly and keep solvent, and with limited resources much enterprise is prohibited.

What I would point out is that societies, even in a small way, are the outcome of a true love for gardening. The support they get is perhaps not in proportion to the good they do, when we remember that their objects are to further horticultural interests, to circulate practical knowledge, and to encourage the cultivation of the best produce.—H.

## Abnormal Ferns.

Mr. R. Lloyd Praeger writes in the July number of "Knowledge" on Fern varieties: "In my last article the normal forms of our British Ferns were under brief consideration. In discussing the curious phenomenon of apospory, it may have been noticed that, in every instance, this was detected, not in the type form of any species, but in some abnormal variety. The abundance of these varieties in our native Ferns, and their marvellous range of variation, are very remarkable features, well worthy of consideration. In no other group of plants throughout the whole vegetable kingdom do we find such an amazing range of abnormal forms. They are often treated as mere florist's monstrosities, and no more worthy of recognition by the botanist than the rainbow-tinted galaxy of Chrysanthemums or Pansies; but two facts concerning them place them at once on a different footing. As many and as remarkable Fern varieties have been found in a state of nature as have been produced by the combined efforts of all the horticulturists; and a large number of them reproduce themselves absolutely true generation after generation, and are even capable of carrying (by crossing with other forms) their peculiar characters into other varieties. The features which distinguish these abnormal forms follow certain definite lines even in species of widely separated genera, and are capable of classification. A remarkable point about these Fern varieties is that they are essentially a British group of plants, and their study is a British hobby. While some foreign Ferns yield well-known varieties—such as the crested forms of several species of *Pteris* and *Maidenhair*—still these are as nothing compared with the wonderful number and range in character of those which have been found wild in our islands, notably in the south-west of England. Another curious point is that the species which are so variable with us appear to lose this character even in neighbouring countries. France and Germany have yielded one or two, but only one or two varieties, where English hedgerows have yielded literally hundreds. These varieties, sports, monstrosities, or whatever we choose to designate them, have occasionally a wide distribution, in which case they frequently obtain recognition from systematic botanists. Frequently—and this is a very remarkable fact—a highly abnormal variety, sometimes even one combining several quite abnormal features, will occur as a single plant growing amid normal forms, and the most careful search will reveal neither parent nor offspring, in spite of the high fertility of Ferns, while in cultivation it will propagate freely and preserve its peculiar character. That famous variety of the Lady Fern, *A. F.-f. Victoriae*, thus occurred in Stirlingshire—a form in which both the cruciate and crested characters are perfectly developed, and are constant in the offspring. The equally remarkably *A. F.-f. Frizelliae* has been twice found—in Wicklow and in Donegal—single plants in both cases, which can have had no connection with each other; and innumerable other instances might be cited."

***Miltonia vexillaria* var. *gigantea*.**

It cannot be on account of its size that the variety was named, for there are other forms of *M. vexillaria* much larger. This variety was shown at the Holland Park Show on June 24 and 25, where a first-class certificate was awarded. Sir Frederick Wigan, Bart. (grower, Mr. W. H. Young), Clare Lawn, East Sheen, was the exhibitor of it. The variety is of a pleasing rose-purple colour, and not unattractive in form. Though *Miltenias* are showy in a group they are not individually pretty.

**The Week's Cultural Notes.**

I have received several communications lately respecting placing Orchids out of doors during the summer months. This is a phase of their culture that needs a good deal of consideration, for not only do species vary considerably in their likes and dislikes in this respect, but the position of the garden has

***Miltonia vexillaria* var. *gigantea*.**

much to do with the success or the reverse of the operation. The Anguloas, for instance, are just now finishing up their growth, and when this is complete they are without a doubt all the better for a few weeks in the open air to consolidate the growth.

I had a fine collection of these in a Wiltshire garden that was low-lying and near the water. They were placed outside every year about this time to their decided advantage, placed in the full sun, and watered at the roots. I took the same plants with me to a higher and drier locality and again placed them outside, only to bring them in again a few days later with scorched and burnt foliage. After this I had to be content with placing them in a cool, shady frame. This circumstance, then, will show that discretion must be used, and that what is right under some circumstances and in some places may be quite wrong in others.

That beautiful Mexican species *Lælia majalis* should always be put out of doors after the growth is complete, its hard, leathery foliage standing exposure to the sun much better than that of many others, while flowers are always produced with greater freedom than when the plants are always kept inside. Many others of the Mexican section are also benefited by exposure, *L. anceps*, *L. autumnalis*, *L. purpurea*, and many more. But in the case of the above noted species, the May flower, as it is termed, it is quite imperative that it has a few weeks in the open air.

The majority of the *Dendrobiums*, again, are greatly

benefited by being placed outside after their growths are fully developed. But it must be after, not before, or the growths will suffer. Should the pseudo-bulbs or stems be so late in growth that they are still unripe at the end of August, then they will be much better kept in, for after this there will be a danger of frost. Still, these could be placed in a sunny frame kept wide open by day in fine weather and closed at night. *Thunias*, again, many of the *Epidendrums*, *Oncidiums*, and others may be similarly treated; but the exposure must be gradual, and looked upon at first in the light of an experiment. —H. R. R.

***Cymbidium rhodocheilum*.**

For many years past there has been talk in Orchid circles of a scarlet-lipped *Cymbidium* which grew somewhere in the swamps of Madagascar, and which had cost the lives of more than one intrepid collector in search of it. When in June, 1892, a plant under the name of *Cymbidium Loise Chanvieri* was shown in London, and secured a botanical certificate, it was mistakenly thought the "scarlet" *Cymbidium* had arrived. It had been discovered by Leon Humblot, in Madagascar, but there was nothing scarlet whatever about its flowers. These were of a yellowish green, with black spots on the petals and blotches of a similar colour on the three-lobed, wrinkled lip, the whole flower reminding one forcibly of *Cœlogyne pandurata* owing to the peculiarity of its colouring and markings.

The new *Cymbidium*, however, now under notice is a quite distinct plant. It has been named *C. rhodocheilum* by Mr. Rolfe, of Kew, and now that it has flowered for the first time in cultivation in that establishment it is unanimously admitted to be one of the most remarkable *Cymbidiums* in cultivation. It has oblong, conical pseudo-bulbs, more or less compressed and about 6 in in length. The leathery leaves are 2 ft to 2½ ft long, not more than an inch broad, channelled down the front, and strongly keeled behind. The flower spike springs from the base of the new and leafy pseudo-bulb, and is 2 ft or more high. It stands quite erect, and carries about twenty flowers. Only about eight or nine of these, however, are open at the same time, and the still unopened buds are remarkable for the exudation of large drops of crystalline nectar at the base.

The flower itself is about 4 in across, with oblong, lance-shaped petals of a soft and pleasing yellowish green without any spots. The petals stand more or less erect, but are broader. They have the same ground colour as the sepals, but are heavily blotched and dotted with black all over the surface, the blotches being thicker in the centre. The lip, however, is the remarkable feature of the flower. It is very large in proportion to the other segments, and has an extraordinary spreading front lobe, broadly obcordate in outline, and of a rich and pleasing rosy-red colour, with deeper veins radiating from the centre to the margins. The side lobes at the base stand erect, one on each side of the bright yellow disc, with purple warts, while at the very base is a raised semi-circular callus of shining ivory white, somewhat similar to the boss in the flower of *Cynochilus chlorochilus*.

*Cymbidium rhodocheilum* was introduced from Madagascar by a Belgian collector named Warpur, in the year 1890. One or two plants were sent to Kew. One has now flowered there, and enabled me to furnish this description and explanation. A few other plants were put into commerce, but so far they have not flowered, although they are doing well. In its native state this *Cymbidium* is invariably found growing on masses of Stag's-horn Fern, *Platyserium Madagascariense*. It seems to delight in plenty of peat and a very humid atmosphere, but not too much water. Judging by the Kew specimen, it is an easy plant to grow if one has just the right kind of house, and it is a great pity that only a few plants of it are known.—W.

[A very good illustration of the species accompanies these notes in the "American Florist" of June 28.]

## Tomatoes Under Glass.

**LATE CROPS.**—The early-raised plants trained up the roof of a light, well-ventilated, properly heated house, now nearly cleared of their first heavy crops, may be made to produce ripe fruit in abundance next autumn and winter. Remove much of the old foliage, allow shoots to form on the main stems, and reserve a portion of these for laying in and cropping. If plentiful stop these growths a joint beyond where a cluster of fruit is set, but if somewhat scarce, especially in the case of basal growths, allow them to extend, and train with a view to having the roof thinly covered with fruiting growths. Closely remove all superfluous side shoots. The plants, whether rooting in pots, boxes, or ridges of soil, should have some of the latter removed from the roots, and a top-dressing of fresh fibrous loam and manure applied at once. A free course of air, warm and dry, is a good antidote for diseases of a fungoid nature that infect from the atmosphere.

A house newly cleared of Melons or Cucumbers is just the place for a winter crop of Tomatoes, the young plants being sturdy and ready for planting now. The crops must be set on the plants before the days become short and dull, otherwise they will probably be very light. First give the house a thorough cleaning in order to get rid of insect pests, and freshen up the soil previously used for either Melons or Cucumbers for the Tomatoes. Plant 15in or 16in distance apart, and train to a single stem up the roof, rubbing off all side growths or laterals as they appear. Nothing is gained by disposing the plants more closely together; but, on the contrary, the greatest weight of fruit is borne by those more thinly planted. Frogmore Selected, Chemin Rouge, and Ham Green Favourite are amongst the best for present planting.—A.

## Fruit Trees.

### The Value of Feeding.

The great advantages to be obtained by feeding wall trees when they are carrying heavy crops has long been recognised and acted upon in British gardens, and it is a pity that the practice is not more generally extended to hardy fruits grown as bushes and standards. In the case of young, vigorous trees of Apples and Pears feeding is sometimes unnecessary, if, when the crops are heavy, the fruit is thinned; but when they get older high feeding does wonders in securing samples of high quality, and there are thousands of trees in this country which should be in their prime, yet which only bear inferior fruits simply because they are starved.

A few years ago I saw a large tree carrying one of the heaviest crops of really good, highly coloured Apples that I have ever seen, and, in addition to receiving a good coating of manure after the fruit was set, the tree was watered regularly with liquid manure throughout the season. The variety was Bess Pool, and in a plentiful season they realised a good price in the market. Now, if this tree had received but ordinary attention quite an inferior sample of Apples would have been produced, which probably would scarcely have paid to send to market. This one illustration is quite enough to "point the moral," though many others might be advanced.

Neither Apples nor Pears are generally a heavy crop this year, though in some instances they do occur; and now is the time to make the best of them by feeding liberally so as to swell them up to full size. In gardens, and in some orchards, liquid manure can be easily applied, because it is near at hand. In such cases nothing is better for the purpose, as it acts quickly on both fruit and trees, giving vigour to the one, and size and colour to the other. Two or three applications during the season would work wonders with such trees, provided the liquid is given in sufficient quantities to thoroughly moisten the soil as far as the branches extend, and that it is not used in too strong a state. Judgment in this respect is necessary; sometimes it may be used at half strength, at others it needs diluting with from four to six times its bulk of water. In large plantations watering with liquid manure is, of course, not practicable, neither can the trees in some private gardens have such attention, but dung or artificial manure can generally be applied. A thin coating of the former in a well-decayed state would conserve the moisture in the soil, and, by bringing active roots to the surface, keep the fruit swelling freely. A heavy dressing of manure is not to be commended, as it prevents the sun and air from acting on the soil, and, in a cold season, retards the colouring of the fruits.

Among chemical manures fish guano is excellent for assisting fruit trees carrying a heavy crop. It should be applied, if possible, when the soil is damp, at from 4oz to 6oz per yard. As a substitute superphosphate (four parts) and sulphate of ammonia (one part) may be mixed together, and applied at the rate of 3oz per yard. One ounce of nitrate of soda per yard if given in showery weather will often prove of great assistance to the swelling fruits, but, of course, it will not do to depend on the nitrate alone year after year. The above remarks on feeding are intended to apply to trees carrying heavy crops, which, therefore, need extra assistance to enable them to produce really good fruit instead of mediocre samples.

This summer feeding ought, however, in no way to interfere with the winter manuring. Nearly all fruit trees, when they begin to bear full crops, are benefited by the application of superphosphate or basic slag, in autumn or winter, in addition to dung, chopped rags, shoddy, or sprats; but judgment is necessary in the matter. Those which continue to grow vigorously should not be manured, while others growing in poor soil sometimes need feeding before they begin to bear much fruit. Each tree must be treated individually if the best results are to be obtained.

As things stand at present, we hear on the one hand complaints about trees making strong sappy growth which dies back during a sharp winter; and, on the other, the cry is that the growth is so stunted that young and middle-aged trees fail to increase in size.—H. D.

## Examination in Horticulture, 1902.

The annual examination in the Principles and Practice of Horticulture was held under the auspices of the Royal Horticultural Society on April 23, 1902, when 229 papers were sent in. Three hundred marks were allotted as a maximum, and all candidates who obtained 200 marks and upwards were placed in the first class. The total number was 97, or about 42.3 per cent. The highest number of marks, 285, was awarded to Miss W. M. Buttenshaw, of the Horticultural College, Swanley, Kent. Those who secured 150 and less than 200 marks were placed in the second class. The number was 98, or about 42.7 per cent. Those who obtained 100 marks and upwards were ranked in the third class. The number was 28, or about 12 per cent. Six candidates obtaining less than 100 marks were not placed.

A slight increase in the number of entries has occurred, 225 being that of 1901; but still it falls considerably short of that in 1900, viz., 236. The percentage of the first class was 48 in 1901, so that it has somewhat fallen; while that of the second class has risen from about 38 to 42. The percentage of the third class is nearly stationary, having only slightly improved from 11 to 12.

The lowering of the percentage of the first class, as well as only two candidates obtaining more marks than 275, is attributable to the somewhat higher standard in the character of the questions. Some students had evidently prepared themselves for meeting such questions as might be asked upon the revised "Requirements."

In the "Principles" there were no serious mistakes, but merely varying degrees of knowledge upon the matter treated of in the replies. The answers as a whole were well expressed, showing considerable care in preparation.

In the horticultural practice department the candidates kept well to the questions they had to deal with, except in the one relating to landscape gardening; on this subject there is considerable room for improvement. It is a subject that might be dealt with in various phases, and some of the candidates were fully alive to the main points they were asked to deal with. Some of the other questions were not so much dealt with in detail as they ought to have been; owing to this very few obtained the full number of marks. Upon the whole the answers were very satisfactory, and, as the questions were rather more difficult than on previous occasions, the result is quite as good as we expected.

Examiners { GEORGE HENSLOW.  
JAMES DOUGLAS.

### FIRST CLASS.

|   | No. of Marks gained. |
|---|----------------------|
| 1. Buttenshaw, W. M., Swanley College ... ..                    | 285                  |
| 2. Moore, Harold, 17, Mundania Road, Honor Oak, S.E. ...        | 280                  |

|      | Robson, H. F., R.H.S. Gardens, Chiswick, W.                   | 110 |
| 219. | Chapman, G. M., Cornwall House, Leopold Road, Wimbledon       | 105 |
|      | James, R. H., Gorphwysfa, Dinas Powis, Cardiff                | 105 |
|      | Kneller, P. C., Laureldan, Petersfield, Hants                 | 105 |
|      | Spencer, J., 40, Lower Church Street, Warwick                 | 105 |
| 223. | Luxford, C., 3, James Street, Illey Road, Oxford              | 100 |

#### A Rose-covered Corridor.

During my rustic rambles recently I met with a delightful feature in a garden which perhaps impressed me all the more because it came to view quite suddenly. After turning a sharp corner I saw before me a long glowing line of pink Roses, connecting the house with the entrance from the road. This I found to be a substantially built corridor 20 or 30 yards in length. The roof, which was covered with tiles, was supported on strong pillars, placed 9ft to 12ft apart. Against each pillar a strong growing Rose had been planted, and these have thrived so well as to entirely cover the pillars and roof of the covered way. There were several varieties of Roses, but as all were pink or rose in colour the effect was most imposing. I had no opportunity of closely inspecting them, but as far as I could see the varieties were Pink Roamer, Jessica, and Dundee Rambler. The thought struck me after seeing this display, that no one should tolerate a building with a bare roof in the dressed garden, but should cover it as quickly as possible with some attractive, strong growing Rose. The old and beautiful flesh coloured Ayrshire Ruga, will do this as rapidly as any climber I know of.—H. D.

#### Roses for Cutting.

The national flower of England has certainly been well chosen, seeing how constantly its popularity has been maintained, and how well it responds to good culture in widely separated lands. Wherever Englishmen go the Rose seems to follow, and speak in fragrance and beauty of the "old home across the sea." The present year of grace will undoubtedly give a great impetus to Rose growing in other lands, seeing how many "sons of the Empire" have been visiting the old home at a time when the Rose is in full glory. Some of them will have visited the great Rose shows and prominent gardens when Roses are a feature, and will leave behind orders for "England's best" in the shape of Rose trees, wherewith to adorn the homes of their adoption, with a souvenir of a momentous year. Our welcomed visitors will, no doubt, have already made their choice from specimens which took their fancy, and although all Roses are good for cutting some are better than others, because of their general floriferousness, stiffness of stem, and distinct or taking colour. I therefore propose to deal briefly with the varieties specially suitable for that purpose; such remarks will of course appeal to Rose lovers at home as well as abroad.

I will deal with the Hybrid Perpetuals first, because they are so hardy and always give a sure return when liberally treated. Mrs. J. Laing is very hard to beat among the soft pink kinds, as it grows strongly, and the finely shaped fragrant flowers stand up boldly. Madame Gabriel Luizet, somewhat paler in colour, the flowers being sweet and prettily cupped, is also a lady to be relied upon, always pleasing and of sound constitution. Baroness Rothschild, rose coloured, and Captain Christy, flesh coloured, are grand sorts to grow for cutting, although the former lacks perfume. La France, the most beautiful of all in regard to form, has one weak point, viz., that it is often too thin in the stem; nevertheless it is worth growing in quantity, as by thinning the growths freely and growing it in an open position the stems strengthen considerably. Général Jacqueminot, is universally popular because of its bright crimson colour—it flowers freely, and needs plenty of feeding to get it strong in the stem. Both this and crimson-scarlet Duke of Edinburgh are varieties to grow in quantity. Suzanne Marie Rodocanachi, although not generally considered as a Rose to grow for cutting, should, in my opinion, receive more attention, as the growth is strong and both flowers and foliage grand. Captain Hayward, bright red, is also grand. For producing extra large blooms the following are not easily beaten: Ulrich Brunner (cherry red), Margaret Dickson (white-tinted flesh), Merveille de Lyon (white-tinted pink), and Her Majesty (flesh).

The Hybrid Teas form a popular class which during recent years have received several grand additions, two of the best being Mrs. W. J. Grant and Kaiserin Augusta Victoria. The former is a sulphury white, the latter rich pink. Marquis Litta, with its long pointed crimson buds, is also a superb Rose for cutting. Among older kinds, Lady Mary Fitzwilliam (flesh), Viscountess Folkestone (creamy white), Grace Darling, and Madame Caroline Testont, are all worthy of being largely grown. The rich velvety crimson Liberty, I should have included among the newer varieties. Although the flowers are by no means large, it has this season proved one of the most popular Roses grown. For growing under glass the Teas are, of course, in the greatest request, but there is no reason why they should not be grown more largely in the open air. Severe weather

during the winter and spring necessarily affects them considerably, but with a little protection and late pruning the risks are reduced to a minimum, and when good flowers are secured the hearts of all rosarians go out to the lovely, delicately perfumed Teas.

The following are fine hardy varieties which usually give good results in the open air, when grown as bushes, or against low walls and fences: Bridesmaid (deep pink), Catherine Mermet (salmon rose), Ernest Metz (carmine rose), and Souvenir d'un Ami. These, to my mind, are decidedly the best of their respective shades of colour. Isabella Sprunt (lemon yellow), Perle des Jardins (rich yellow), and Madame Hoste (yellowish white) are the pick of the yellows for their hardiness and free flowering qualities. Homère (rose, small), Hon. Edith Gifford (flesh), Madame Lambert (bright red), Madame Bremont (coppery yellow), Rubens (rose and white), and Sunset (deep apricot) are all good. The Bride and Souvenir de S. A. Prince cannot, I think, be beaten among the whites. No garden should be considered complete without a few Moss Roses, for in the bud state they are delightful additions to any arrangement of cut Roses. Here are a few good varieties: Cristata (pink), Old Moss (pink), White Bath, Blanche Moreau (white), and Eugénie Verdier (crimson).

In establishments, when large quantities of cut flowers are required, it is an excellent practice to grow considerable numbers of Rose bushes in the reserve garden, as it always seems a pity to destroy the beauty of a Rose garden by cutting the flowers wholesale when the garden should look at its best. Another advantage secured by following the plan advised is, that special attention can be given to feeding during the summer, so as to secure blooms of very high quality.—WARWICK.

#### Planting Roses too Deeply.

We have recently lifted a lot of standard Roses that had been planted some three or four years and had not succeeded too well. The reason of their doing badly was not far to seek. They were planted from 1ft to 18in in the earth. This state of things is not at all uncommon, especially with the work of that genus known as the jobbing gardener. Plants so put in cannot be expected to do well. The few roots they have are in the least fertile of the soil, and whatever manure is afterwards used may not reach them.

Standard Roses should have the roots just covered only, and to prevent dryness a mulch of manure ought to be spread around the stems during the summer. Considering the amount of top a Rose has it is astonishing how few roots we find to support it; therefore, it is necessary that every fibre should be in perfect health. Plant shallow and securely stake should be the rule with standard Roses. Dwarfs, again, are often planted too deep. The roots should be spread out to their full length in a wide, shallow hole rather than thrust straight into a narrow one. We like to just cover the junction of stock and scion when the work of planting is finished. Always mulch newly-planted Roses. This not only protects them from hard weather, but keeps the plants in position. It is well, too, to shorten any shoot of undue length; these only become a means for wind to loosen the whole plant if left.—H. S.

#### Roses at Kew.

No one passing through the Rose-dene near the pagoda at Kew can do so without stopping to peer into the great mass of Crimson Rambler which forms such a gorgeous semi-circular group on the left hand side going west. Its frontage runs to 55yds, but the whole plantation is so arranged as to be visible in one splendid view. This dene, or little dell, was a gravel pit some years ago, but by the use of clayey soil and manure, and the employment of large tree-roots, a perfectly adapted site for Rambler, and climbing Roses generally, was obtained. The climbing kinds were planted all along the back of this prepared site, and here and there a mass or group was brought forward to the central path, which is laid in grass and is slightly curved. There is no entire view from end to end, the object being advisedly to display only a portion of the splendid collection at a time. Large bays are formed for Briar Roses at intervals on the right hand side, the Crimson Rambler group occupying nearly the whole of the opposite side, as I have said.

In planting this huge mass of so handsome a Rose, the back parts were raised in order that the floral exhibition could all be seen from the pathway, and the long, robust shoots hang down over the roots and faggots at the front edge in rich profusion. The feature might very well be copied on many other gardens, even if the same amount of space could not be given.

Amongst others of the Roses in groups and masses here we have noted the Austrian and Harrisoni Briars, the rugosas and numerous hybrid forms, as rugosa x Wichuriana, rugosa x Général Jacqueminot, or, again, the weeping Wichuriana and Général Jacqueminot Hybrid Perpetual. The Prairie Rose (*R. setigera*), with *R. cehroleuca*, Noisette Fellenberg, Carmine Pillar, Flora, the Dawson Rose, and many others further contribute towards the interest and beauty of the collection.—J. H. D.

# NOTES & NOTICES

## The Midland Carnation and Picotee Society.

At a committee meeting held on Thursday last, it was decided, on account of the lateness of the season, to postpone the exhibition of the above society till Thursday and Friday, August 7 and 8, instead of July 30 and 31, as originally fixed.

## Crystal Palace Fruit Show.

The Royal Horticultural Society's ninth great annual show of British grown fruit will be held at the Crystal Palace on September 18, 19, and 20. For schedule of prizes, including special ones for bottled and preserved fruits, and full particulars, apply to the Sec., R.H.S., 117, Victoria Street, S.W.

## South Shields and Northern Counties Chrysanthemum Society.

We are asked to draw attention to an advertisement under "Shows" on the second page, wherein are offered good prizes by the above society. Its show is being resuscitated after a lapse of a few years, and we cordially wish that fine weather may prevail for this year's exhibition, and that in every way it may be successful.

## United Horticultural Benefit and Provident Society.

The usual monthly committee meeting of this society was held on Monday evening last, at the Caledonian Hotel, Adelphi Terrace, W.C., Mr. C. H. Curtis in the chair. After the minutes of the last meeting were read and signed four new members were elected. The death of a member was reported, and the amount standing to his credit in the ledger was granted to his nominee. A request for assistance from the convalescent was granted to a member who has been ill a long time. Four members were reported on the sick fund.

## Queen Victoria's Cottage at Kew Gardens.

On July 7 the Richmond Town Council resolved to request the member for Richmond to call the attention of Parliament to the non-compliance with the wish of the late Queen Victoria that the ground surrounding the Queen's Cottage in Kew Gardens should be opened to the public. It was true, Councillor Hasler said, that a path had lately been opened through the grounds, but that was all. [There is plenty of ground for the public to roam at pleasure in the gardens themselves, and as a quiet sanatorium for bird life during the nesting season, and also for wild gardening, we think the director does well to keep visitors from the Queen's Cottage grounds.]

## Echoes from Hamilton.

When the days are darkest and the looming clouds are deepest, oft the silver streaming gleams of sunshine pent up in gloom break out precipitately upon the earth, and dispel the sickly pallor everywhere umbered, in such circumstances, on the face of Nature. It was thus, as the month of June was on the eve of taking its departure. The long timed leaden clouds which obscured the usual genial rays of sunshine, so peculiar to this month, broke suddenly asunder, and, without the least sign or symptom, man, beast, and plant were rushed into a subtropical atmosphere. On two or three occasions the temperature rose to 80deg Fah. in the shade, a rather trying ordeal to pass through after a protracted subjection to a temperature not very much above winter. Pat was not very wide of the mark when he said in reference to June "that he saw a summer like this last winter." But, alas! the change, if drastic, was equally short lived, and all that we have experienced of the present month has been of a very spasmodic character—one day or so good and the other bad or indifferent. To-day (12th) as we write, the outlook is extremely gloomy. The elements pour forth their fury in wind and rain incessantly since early morning, and the air is cold and chilly—a feature associated indeed with the night temperature of the season. But we must not be gloomy, for man was created for a higher purpose. The wells of hope deposited in his bosom amply assure us of that fact, for truly they are commensurate with the springs of life itself. Therefore we, the sons of the soil, must hope, though the days are dismal and the dark impending clouds are threatening, that behind all lies the proverbial silver lining.—D. C.

## National Carnation and Picotee Society.

The National Carnation and Picotee Society will hold their annual show on Tuesday, July 22, in the Drill Hall, Buckingham Gate, Westminster, one to six p.m.

## Success of Dundee Florists.

Roses, in common with other flowers, are a fortnight later than usual this season, and on this account Scottish growers have been unable to attend any of the early Rose shows. On the 11th, however, at Ulverston Rose Show, Messrs. D. and W. Croll, Dundee, were enabled to enter an appearance, and were successful in carrying off second prizes for each of seventy-two blooms, thirty-six blooms, and eighteen blooms, against English growers.

## The Comfort of Canadian Voyagers.

A novel idea has been put into practice by Messrs. Elder, Dempster, and Co., which might well be followed by the railway companies, though the suggestion will probably be considered too Utopian yet. The Beaver liner Lake Ontario, which arrived at Liverpool from Canada on July 13th, had on board a considerable number of passengers, and, on the instructions of Sir Alfred L. Jones, the carriages of the special train conveying the City bound passengers to London from Riverside Station were decorated with flowers, and baskets of fruit were also provided for the consumption of the fortunate travellers.

## Great Hyacinth and Tulip Competition for 1903.

The Royal Bulb Growing Society of Haarlem have offered, and the Royal Horticultural Society have accepted, a grand prize for Hyacinths, and another for Tulips, to be competed for at the Drill Hall, on or about March 24, 1903, as follows:—120 Hyacinths, in pots (single spikes), in forty varieties, not more than three pots of any one variety. Open. First prize, £7; second prize, £5; third prize, £3. 100 pots of Tulips, in fifty varieties, three plants of the same variety in each pot, and not more than two pots of any one variety. Open. First prize, £4; second prize, £3; third prize, £2.

## Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, July 22, in the Drill Hall, Buckingham Gate, Westminster, one to six p.m. At this meeting plants—other than for certificate—can only be shown in very small groups, and only then by pre-arrangement with the superintendent. A lecture on "The Botanic Gardens and Flora of Malta," illustrated by limelight, will be given by the Rev. Prof. Geo. Henslow, M.A., V.M.H., at three o'clock. At a general meeting of the Royal Horticultural Society, held on Tuesday, July 8, seventy-four new Fellows were elected, amongst them being Vicountess Strathallan; Lady Fermoy, Lady Savile, Lady Clementi-Smith, Sir Cecil Clementi-Smith, K.C.M.G., Col. Carruthers, and the Hon. Cecil Campbell, making a total of 826 elected since the beginning of the present year.

## The Agricultural Association of Hungary.

This association, in co-operation with the Pozsony County Agricultural Association, and with the council of the town of Pozsony, holds its second national agricultural exhibition at Pozsony (Hungary, near Vienna), from the 7th to the 14th of September, 1902. The exhibition will be connected with agriculture, wine growing, horticulture, &c., also conferences and excursions. The exhibition will consist of the following six branches:—I. Exhibition of stock (horses, cattle, swine, sheep, dogs, poultry, bee farming, rearing of the silkworm, and on fishery). II. Growing of plants (seeds, exhibition of Wheats, forage plants, geology of the soil, retrospective and collective exhibition). III. Wine growing and farming, wine dressing, pomology, horticulture. IV. International exhibition of agricultural implements. V. Domestic industry: people's industry; exhibition of articles. VI. Exhibition referring to forestry and the chase. Pozsony may be reached from Vienna in an hour on railway. There come trains from Vienna to Pozsony twelve times daily, and two steamers on the Danube daily. Hungarian agriculture in all its branches is in its most developed state in Pozsony (in German called Pressburg) and surrounding counties. Pozsony, with an old castle, the Danube, and the surrounding hills, is one of the loveliest parts of Hungary. Special attention will be given to English-speaking visitors, and English-speaking officials will be present in the exhibition.

## Poisons for Industrial Purposes.

Will you kindly allow me to bring under the notice of your numerous readers the action that is being taken by and on behalf of a number of important traders who are interested in the sale of poisons for other than medical purposes? Agricultural agents, farmers, fruit growers, seedsmen, ironmongers, druggists, and many others are concerned, and to some of these the subject of this letter may not be unfamiliar, while to others, who have not had their attention directed specially to it, it may be both new and interesting as well as important. To put it briefly, the question at issue is the right and the desirability of poisonous compounds required for trading and industrial purposes being sold by other than dispensing chemists and druggists. The latter possess, under the Act of 1868, the monopoly of all such sales, and occasionally the Pharmaceutical Society, acting in their behalf, institutes prosecutions for the recovery of penalties with the object of asserting this monopoly. It is for the purpose of relieving traders of the liability of being proceeded against, and thereby meeting the convenience of the public at large, that an organisation entitled "The Traders in Poisons or Poisonous Compounds for Technical or Trade Purposes Protection Society" has been formed. The society, of which I have the honour to be secretary, was formed in March, 1900, since which date it has been very successful in organising the various traders who are directly concerned in the sale of poisonous compounds for industrial purposes. Upon the eve of the last general election it communicated with most of the Parliamentary candidates, and 90 per cent. of the replies received were favourable to the society's objects. Briefly put, the object is to secure an amendment of the existing law. Effectual and energetic steps are being taken to secure immunity from prosecutions. This is largely due to the great and sustained interest taken in the protection society by its treasurer (Mr. G. H. Richards, of XL All fame). There are many reasons why the Pharmacy Act of 1868, already alluded to, should be amended. In the first place, it is evident, from the preamble, that it was intended more particularly to ensure the safety of the public by insisting that only competent persons having practical knowledge of the properties of poisons should have the dispensing of the same. That is reasonable enough. But in the days when the measure became law there were not in existence the multitudinous packages and bottles of preparations compounded by the manufacturer ready for immediate use for horticultural, agricultural, and other trade purposes, which are now to be met with all over the country. As regards these, the ordinary chemist and druggist has no more practical knowledge than the man in the moon. The manufacturer tells him—and the public at large—by advertisement that this or that mixture, or sheep dip, weed killer or powder, is an excellent remedy for this or that disorder, and the purchaser, like the chemist, takes it on trust for some specific purpose, the chemist being merely the channel through which the manufacturer reaches the customer. There is no skilled practical knowledge of poisons required to dispose of a sealed packet or vessel which the chemist receives from the manufacturer, who alone undertakes the responsibility of declaring that a compound of poisonous articles, of a certain strength, is effective for a certain purpose. The purchaser might just as well buy what he wants from any other tradesman, so far as the skilled knowledge of the chemist is brought to bear upon the article disposed of. Indeed, in most cases it would be distinctly advantageous to the buyer if he went to some person who had practical experience of the preparation required. Take, for instance, the case of an insecticide (such as XL All) containing poison. Would not a seedsman or horticultural agent be more likely to give valuable advice to a purchaser, based upon practical experience, than a chemist, whose principal employment is the dispensing of drugs intended to cure all the ills that flesh is heir to? The same argument applies to sheep dips, weed killers, &c. If there is any risk to public safety involved in the proposed freer sale it is not increased by disposal through a seedsman nor minimised by being handed over a chemist's counter. The new vapourisers and insecticides which have come into such general use in recent years have been invented by members of the horticultural trade, and people who are accustomed to their application are naturally the best advisers of purchasers, not chemists, who know nothing of them beyond the label on each packet. A measure such as is contemplated would also enable photographic requisites containing poison to be sold by others than chemists.

It is to the benefit of traders in all parts of the country that the society to which I have referred is exerting itself, and I am glad to inform you that the reasonableness of its demand has been admitted by the Privy Council, who last year appointed a Poisons Committee to investigate the matter and report on the evidence submitted to them. Already that committee has held three sittings, at which witnesses were heard on behalf of the Pharmaceutical Society on the one hand and our protection society on the other, besides some independent skilled and

departmental witnesses, and there is good reason for believing that the committee may recommend the adoption of a third schedule to the Pharmacy Act, which will provide where poisonous compounds are sold in sealed packages for agriculture, horticultural, disinfecting, and other trade or technical purposes by persons other than chemists, who shall be duly licensed, and, being respectable and responsible individuals, they shall be lawfully entitled to sell such articles. It must be understood, however, that this desired result can only be obtained by the traders concerned bestirring themselves, and bringing pressure to bear upon the members of Parliament in their respective districts, pointing out to them the desirability of the Government being urged to bring in an Amendment Bill for the purposes above indicated. For every fully qualified chemist there must be a large number of agricultural agents, horticulturists, seedsmen, oil and colourmen, ironmongers, hardware dealers, and the like who would benefit by an amendment of the law which enabled them to sell, without fear of prosecution, many articles in great demand in town and country alike. I therefore hope that this trade protection society will receive their cordial support in its attack upon a monopoly, and will attract the continued and extended interest of all those who wish to see that monopoly broken down. If other information is desired on this important subject it will be readily furnished by—Yours faithfully, THOS. G. DOBBS, Secretary, 24, Sansome Street, Worcester.

## Conservatory Walls Clothed with Ferns.

I think if more of our amateur friends knew how easy it was to establish Ferns on the ordinary upright brick walls of conservatories or greenhouses many would be anxious to do so. I enclose a photograph of the well-known *Adiantum Capillus-Veneris*, which had been placed on the wall of a conservatory in the gardens of which I then had charge (Clarence House, East Cowes) just two years previous to the taking of the photograph. I thought it might interest the readers of the Journal if I briefly describe the method of procedure to obtain success.

It must be remembered that all Ferns producing rhizomes such as the one mentioned above are far more suitable for the purpose, as under proper treatment they attach themselves to the wall, and hold their own without assistance. Select plants growing in any size of pot, from a 48 (5in) upwards, and turn them out if possible during the last week in February or the first week in March. Lay them on their sides, and cut off the upper portion or crown to a depth of about 2in with a sharp dinner-knife or similar instrument; it will then be in just the condition for placing against the wall, flat, with just sufficient root action to give it a good start.

Then comes the question of making fast to the wall, which is best done by means of 14 gauge galvanised wire, made fast by small staples across the crown of the plants in a neat style, so that it would scarcely be visible once the fronds started to grow. According to the size of plant or crown so the distance apart of plants should be determined. For instance, the majority of the plants we put on in this fashion were turned out of pots averaging 10in in diameter and placed on the wall 2ft apart, which became completely furnished in about two years. After the plants have been made secure mix up two parts of clay with one of cow manure, encircling the outside of each crown, which, if kept moist, will give the roots a good chance of adhering to it, the cow manure acting in the double capacity of preventing the clay from cracking and acting as a mild stimulant to the plant when growth commences.

The only necessary precaution to be taken afterwards is never to allow the wall to become dry. This can be kept moist daily either by syringing or, if it be a low wall, by running along a small spout can at the top and allowing the water to run down to the bottom. Or a better plan still (if the grower has a water main at his or her disposal) is to fix a small perforated pipe the whole length of the wall, turning it on for about a quarter of an hour to saturate the whole. The effect produced in a good structure used for general plant growing, and the valuable aid which this variety renders when the *Cuneatums* are resting, previous to starting in the spring, cannot be over-estimated. The whole length of wall covered in the photograph, including two ends and side, was 75ft.—C. MARTIN.

## Improvements in Hardy Plants.

(Concluded from page 27.)

Among the *Heucheras* there is a possibility of very great improvement. A crimson *H. erubescens* would make a charming plant, and as these are easily crossed and the results quickly seen would be a nice family for some impatient enthusiast to take up. *H. zabeliana*, a Continental introduction, is one of the first hybrids we have, and a very good plant it is. *H. sanguinea* appears to be degenerating. Even the variety *splendens* does not come up to the standard of what I grew in my private garden at Tottenham. Originally there were six plants—one died on the road—brought by Dr. Murray from Lower Mexico, which he gave to me. The description he gave of this species growing wild was of a plant 3ft or 4ft high, with flowers more than double the size, and scores of branching spikes emanating from quite small clumps, and when he saw them at Tottenham for the first time he was more than disappointed, and did not consider the plant worth the trouble he had bestowed upon it. The spikes he saw at Tottenham were far more beautiful than those usually seen in English gardens.

The *Iris* present a fine field for the hybridiser, although they are not so easily managed as one might suppose. They have always been popular. We have had a few new varieties of *Germanica*, a good many new varieties of the *obliquata*, and a few hybrids of *Max Leichtlin* and *Sir Michael Foster*, and a few others are the nett proceeds of the last twenty years. There has never been much done in the way of hybridising, *Max Leichtlin* being one of the first. One of the best of his was *Warei*, a cross between *I. susiana* and one of the *Germanica* sections, but he does not appear to have been very successful with them. *Sir Michael Foster* has many hybrids, some most charming, and he appears to be crossing everything. His *monspur* sections are good, the result of crossing *Monnieri* and *spuria*. *Parsam*, a cross between *paradoxa* and *sambucina*, is very pretty, and there are many others that we know little about. I had almost forgotten the *Iris Kämpferi*. A marvellous change has taken place in these since the late Baron von Siebold introduced his first set from Japan. These had quite small flowers, and were not worth growing by the side of those now in cultivation. I believe the first information we had of these large ones was at Tokenhouse Yard, when Messrs. Protheroe and Morris offered some thirty or forty clumps, one or two plants of each variety, accompanied with the usual Japanese drawings. These caused quite a sensation, and realised several pounds a clump. The Japanese were not slow in sending over many more, and for the last twenty years a regular trade has been done in them, but I do not think we have any more varieties now than then. *Iberis*, *Inulas*, *Lathyrus*, *Linum*, and *Linarias* we must pass. All are good popular families, from which improved varieties could be obtained.

The *Megasea* has received a fair share of attention, Mr. Smith of Newry, having raised a great number of seedlings, some very interesting, but there are not enough whites and light shades of colour. Unfortunately, this family has never been very popular with the public.

The Evening Primroses present many opportunities for hybridising and selection. Sooner or later we shall have some one finding a white *microcarpa* or *fruticosa*, both of which would be eagerly sought after, and if whites, why not roses and reds?

Has anyone seriously attempted to cross this family? I have never heard of one, and I feel sure they would pay well for a little attention.

I must not pass the *Pentstemons* without mentioning *P. heterophylla*, a lovely Californian species of a beautiful blue colour. I see no reason why we could not get blue ones among the hybrids, seeing both are very similar in growth.

*Potentillas*.—What a wealth of colour we have in the hybrid *Potentillas*. The combinations are marvellous, but all spoilt by the lazy habit of the plant. Could we not obtain a new set, less rampant in growth and erect? If we could it would be a great boon, for we have no other family possessing so much brilliancy of colour as these.

*Scabiosa caucasica* is now producing a nice range of colour, and, as they can be propagated by division, will become very useful. Unfortunately, they are slow in increasing, and it will be some years before we see much of them. Some of the new shades are delightful.

The *Spiræas* are an important family and great favourites, and there is no question that many improvements can be made in them, especially in point of colour. A coloured variety of *S. japonica* or *S. Aruncus* would cause quite a sensation. I would not say they can be obtained, but I know they are well worth trying.

We have a good pink variety of *Spiræa gigantea*, and I remember having offered to me a bright pink variety of *S. filipendula*, but such a fabulous price was asked that it was impossible to secure it. Twenty-five years ago this class of plant was at a very low ebb. What became of it I never knew, but I can see it in my mind's eye now, and should like an opportunity of obtaining it.

*Sedum spectabile* contains many points of great merit, and if we could get a batch of seedlings, improvement only in colour would be a great commercial success.

The *Statice* are becoming more popular now attention has been given to selection, &c. In *S. limonium* we have a very variable species, varying from the purest white to all shades of blue and pink, with dense heads of flower 2ft across. The individual flowers are smaller than those of *S. latifolia*, but far more graceful for cutting. These are much sought after for this purpose.

There are hundreds of other families that could be mentioned, all of more or less interest, and from past experience with other families feel sure similar

results could be obtained. It will be useless for anyone to take up this matter unless it is done systematically, keeping to the object in view and working to obtain it.

There must be nothing left to chance, as the cost of planting out, say, 1,000 *Aster* chance seedlings is great, especially if you get no results; whereas twenty carefully selected might produce one or two worth keeping, if only for further trial. One is not going to get novelties the first time of asking. It is a question of close watching and perseverance, and if only one or two are taken up by anyone here to-night with an idea of improvement, my work this evening will not have been thrown away.—(A paper read by Mr. Amos Perry, of Winchmore Hill, London, N., before the Horticultural Club.)

### Nostell Priory, near Wakefield.

"Since you visited here," writes Mr. Easter, "our old range of glass houses is all cleared away, and the new range in its place is nearly completed, by Boulton and Paul. There are eight houses in all—two Palm houses, two Melon houses, forcing house, vinery, Carnation, and plant house."

Conservatory wall clothed with Ferns.

## Cypella Herberti.

The Cypellas, with few exceptions, are not cultivated in gardens, partly because some of the Irises are showier and probably easier to manage than the Cypellas are, and also because the claims of the latter are not sufficiently emphasised in the Press. The species we illustrate in this issue on page 63 is recognised as one of the best, and is more generally grown. The Iris-like flowers are "yellow, varying in shade to a deep chrome tint." They are sparingly produced, however, and their beauty-excellence may not be regarded as sufficiently satisfying to induce a liberal addition of this species. Cypellas are half-hardy, bulbous plants, and may be included along with Hypoxis, Sparaxis, Freesias, Anogonanthus, Scillas, and such other plants which are not generally hardy enough to be left out of doors. They thrive in a light soil. C. Herberti flowers in July.—F.

## Hardy Flower Notes.

Almost all the Acænas, or New Zealand Burs, are desirable plants for the rockery, though it must be said that several are of an aggressive habit if left alone and permitted to ramble at will. I often wonder, however, that they are so little used as carpeting plants for summer planting, for which they are well adapted on account of the close, creeping habit of so many of the genus and the pretty hues some of them present. We have in A. Buchananii one of these, and one, too, which has been but little grown in gardens. For the rock garden it is a little gem, with its pea-green foliage, in which its charm consists. "Pea-green" is the nearest one can come to the precise shade, but it wants to be seen to be appreciated. The flowers are inconspicuous, as are the "burs," or fruits. It is of slightly trailing habit, and it seems to like a little moisture and also to thrive well in shade. It is a native of New Zealand, and is quite hardy. By the way, I recently received this Acæna under the name of A. Berteri, and promptly notified the sender, who said he had it from a good source. This I do not doubt, but the name Buchananii is, I have good reason to know, the true one of the plant of which I speak.

### Achillea mongolica.

Not a new plant, this Milfoil is yet one which ought to be grown in many gardens where it is yet unknown because of the value for cutting of its charming single flowers of pure white, as well as for the beauty of the whole plant as cultivated in the borders. The foliage in itself is neat, and when to this is added the summit of its beauties in the shape of flowers we have a plant worthy to take a place in the most select border of hardy flowers. It is of neat habit, too, its height of about a foot and a half only enabling it, as a rule, to dispense with tying in sheltered gardens, a benefit in the case of an elegant plant like this. It will grow in any common soil, but it ought to have a sunny position. A. mongolica is perfectly hardy, and may be raised from seeds or increased by divisions. It is easily obtainable from most good hardy plant nurseries.

### Mertensia sibirica.

In this pretty flower, introduced so long ago as 1801, we have an instance of a plant much prized at one time sinking, with so many other hardy flowers, into neglect, and now once more sought after and appreciated. That it is now prized is due, however, not to any gaudy colouring or monstrous blooms. It is, on the contrary, a flower liable to be overlooked by the casual visitor to gardens—the one who strolls along and merely glances at a flower without taking true notice of its character. There is in the colouring of its leaves and flowers a kind of subtle harmony instead of a contrast, which tends to prevent the colour of the blooms striking the ordinary visitor to a garden. If, however, the flowers themselves are examined, then the pretty colouring, sometimes described as blue, sometimes as heliotrope, is unreservedly praised. I do not know that either of these terms are expressive enough, for there is about it some of the lustre on the neck of a blue pigeon, such as one sometimes sees in lustre glass or silk. Then the arching habit of the branches is graceful, as well as the drooping of the flowers in their tube-blossomed cymes. In addition to the ordinary form of Mertensia sibirica, there are also two pretty varieties, named respectively alba, which has white flowers, and atro-cerulea, which had darker blue blooms. This Siberian Mertensia grows from 6in to 18in in height, and flowers generally from May to July. One advantage it possesses is that it likes shade and it will grow in common soil, though I find it prefers a moist, peaty one. In full sun it is least satisfactory, especially if the soil is dry and sandy.—S. ARNOTT.

## The Judas Tree.

Regarding your note in this week's issue on Cercis siliquastrum, there is a good specimen here (Glliffaes Gardens, Crickhowell, Brecon) quite 12ft high.—J. R. Ecob.

## Eucalyptus globulus in the South.

You will please find enclosed branches and flowers of Eucalyptus globulus (or Blue Gum tree). It is not a common occurrence to be seen in bloom in this country, and I should like your opinion, or some of your correspondents, on the subject in your Journal. The plant is about thirteen or fourteen years old, is over 30ft high, and it is the second time it has bloomed. You will also observe that on the young shoots flower-buds are forming, which will come in bloom next year.—T. J. POLKINGHORNE, The Gardens, Bodmin, July 14, 1902.

## Gardeners' Bothies.

There has lately appeared in the Journal, and also in some of its contemporaries, a deal of sentimental writing about bothies and bothy life. Some writers went so far as to describe bothies as moral nuisances. Not having read much of what has appeared in print on the subject, I am not going to discuss it in any shape or form. But herewith enclose you a photo of the bothy at Nostell Priory Gardens, which accommodates five hands, and a woman is kept to attend to it and the men. Where such is the case they are very comfortable, and much appreciated by those occupying them, and I consider the bothy an indispensable adjunct to any pretentious garden establishment, and in some localities I cannot see how they could be dispensed with as some seem to think.—JOHN EASTER, Nostell Priory Gardens.

I quite agree with your correspondent, Mr. R. Russell, in his remarks in your valuable Journal of July 3, and as I have lived both in bothies and in lodgings, and for years I have had young men working under me living in bothies, I claim some experience in that mode of life. One of the advantages in living in or near the garden is that there is a much better opportunity for improvement than is usually found in the sort of lodgings that a young gardener can afford to pay for. When I lived in lodgings in Edinburgh I had my food prepared for me and my room put straight; but I was not supposed to be in my lodgings except for meals and to sleep. Now, where was my opportunity for study, even if I had the books which I could not afford to purchase out of 12s. per week? When I have had to engage young men for the garden, in nearly every case the first question asked of me was, "Is there a bothy?" and that generally settled the engagement. Therefore, I think if there were a poll taken of young gardeners, the majority would be for the bothy, as there is a much better opportunity to study for those who are inclined to do so, and for the collecting of botanical specimens, which every young gardener ought to do, in order to make himself familiar with every plant he may come across. There is nothing more humiliating than when a gentleman asks his gardener the name of a plant and he has to say, "I don't know."

One thing I should like to see more in practice, which would be of great advantage to young men, and that is the naming of plants in our public gardens. It would not only be a benefit to the profession, but interesting to the public generally. I visited a so-called botanic garden in the Midlands not long ago, in the hope that I might learn something; but I could see nothing to learn from, as there were no labels visible, so I concluded they were all in the offices having their spring cleaning done. It was not much loss to me, but for young men desirous of qualifying for the battle of a horticultural life it is an injustice to them, as there are not many young men in the country that have an opportunity of going to Kew or Cambridge where they can run and read the names and orders of plants unknown to them. It is no easy task for a young beginner in botany to find out the names of plants that he does not know, even if he has a Loudon or a Lindley by him, whereas if our public gardens were better supplied with labels it would be a boon and a blessing to bothy men, and give them a better opportunity of improving themselves in their leisure hours, which would be much more profitable in

the long run than making a study of sporting life. And I should like to impress upon young men in the garden that when they seek for an appointment as head gardener they will not be asked if they know the name of the horse that is to win the Derby; but rather if they have a thorough knowledge of their profession in all its branches; and that knowledge can be acquired by a perseverance and study in a well conducted bothy in the quiet of a gentleman's garden much better than in a lodging-house where all sorts and conditions of men are put up.—D. DONALD.

### Rose Frau Karl Druschki.

We are interested to read your appreciation of this Rose as shown on the 8th inst., and as the first exhibitors of it, at the meeting of the Royal Horticultural Society on the 8th April last (although we did not enter it then for an award of merit), we think that your readers may like to know something of its history. It was raised by Mr. P. Lambert, of Trèves, in Rhenish Prussia, as the result of a cross between Merveille de Lyon and Caroline Testout, and made its début at the show of the German Rose Association at Trèves in June, 1900, when it was named after the wife of the esteemed president of the association on that occasion. Our Mr. Arthur William Paul, who attended the show in question in the capacity of a judge, saw the Rose also growing in the grounds of the raiser, and was thus enabled to correctly estimate its merits on the spot, and as a result we secured an early supply of plants. It is without doubt one of the most valuable white Roses; the flowers are large, with beautifully-shaped petals, while the semi-climbing habit of growth and freedom in blooming render it most effective for garden decoration. As a white forcing Rose it is excellent.—WM. PAUL AND SON, Waltham Cross.

### Culinary Peas.

Perhaps a slightly lengthy reply to "N. N.'s" kindly criticism made on page 557 of last volume may be permitted, as the subject is one of prime importance. I may say I am not at all surprised that "N. N." should hold on to Ne Plus Ultra against all others, especially as he cultivates a carefully selected strain, and no one I am sure would venture to dispute the sterling good qualities of that variety. At the same time, if he continues to grow Autocrat, and treats it according to its individual wants, I have no hesitation in saying he will find it the better variety. Two years is too short trial. How long I have grown Autocrat I cannot well say; but Mr. Ward, writing in the "Gardeners' Chronicle" last winter, mentions having seen it here seventeen years ago, a proof that I ought to know the good and bad qualities of the Pea by this time. I am quite at one with "N. N." as regards the varying effects produced by different soils, and, I might add, climate too, though I see Mr. W. P. Wright, Kent, the other day named Autocrat as the best late variety; so that we may conclude it succeeds in a widely varying climate too. But in addition to these items, there is another feature of this Pea it is essential to study, which I may be allowed to call its personal peculiarities. I discovered long ago that Autocrat and Ne Plus Ultra required, in one point at least, different treatment. The latter can be sown a week later than the former, and if they are sown both together at the latest dates suitable to Ne Plus Ultra, Autocrat most certainly will fail. I, in fact, sow it twice, at intervals of ten days, that is for late gathering, and its habit of flowering continuously secures that plants from the earliest sowing continue bearing as long as those sown later.

The main drawback to securing late Peas here are late autumn frosts. Annually the late Peas are cut down bearing abundant crops of pods, as well as quantities of bloom, and in the treatment of this crop it is of the utmost importance to produce a hardy plant. It is a marked peculiarity of Peas that when young in spring they come unscathed, or little damaged, through a frost that annihilates them in autumn. Another point about early Peas is that it is decidedly advantageous to employ manure for the crop in order to carry it successfully through the dry, hot weather they have to encounter when podding. In the case of late Peas I fail to discover any good reason for applying manure in any form to the soil. Its effect is to cause a stronger and less hardy growth, which is in this case just what is not required. If the seeds are sown a little deeper than usual, to insure against root dryness, that is generally sufficient, though in a hot, dry season like last year, watering could not be avoided in July. As to depth of soil, that is a consideration of much importance, but the seed should not be placed on a loose substratum. If the ground is prepared for the crop just previous to sowing, and the soil is at all light, then it ought to suffer compression first. This, too, is an aid to sturdy growth.

Thin seeding is no doubt all-important. I sow in double lines, with the seeds at 3in apart in the lines. As to tall Peas,

I feel so little pleasure in them, that aspiring tops are invariably switched off by means of a hook. In addition to preserving them in a desirable medium as to height, this treatment has also the effect of causing the Peas to swell and to induce the production of a larger quantity of bloom than occurs with Peas left to climb unchecked. There is just another point I wish to indicate. Whoever wishes to have late Peas in quantity sufficient to produce one or two dishes daily must largely increase the sowing beyond that usual for summer uses. I have 350 yards run of Autocrat coming on for late use, which allows 50 yards for each day, and a week to elapse before it is again gathered. Great care in gathering is needful, because if any but full swelled pods are gathered, the supply will be certain to suffer later. It is, moreover, a commendable practice, should frost appear imminent, to gather as many full pods as possible and place them in the fruit room or other perfectly cool building until required. If the frost does no harm, nothing is lost; while, on the other hand, if sufficiently hard to destroy the crop, the supply will be insured for a week or a fortnight longer.—R. P. BROTHERSTON.

### Sir Thomas More's Mulberry Tree.

The daily journals have noted the fact that Beaufort Street, Chelsea, built early in the reign of George III., which has some curious old-fashioned gardens, is now doomed. Amongst the trees and shrubs to be removed is "More's Mulberry Tree." Certainly this street crosses the site of Beaufort House and part of its gardens, but it is doubtful whether the tree dates back to the days of More. Probably it is a descendant of one existing in the reign of Henry VIII. There is, or was, another old, twisted Mulberry in the grounds attached to the Clockhouse, which had also once belonged to the Beaufort House Gardens, and contained a "herbary," with various interesting plants and fruit trees. In the garden of Chelsea Rectory there is another ancient Mulberry—indeed, the village was formerly famous for this tree, and over at Chelsea Park about 2,000 were planted by James I., a few of which yet exist. It has been suggested that the Romans brought the Mulberry to Britain, but we have no mention of it in books till the sixteenth century. The oldest trees are (or were) three at Sion House, Middlesex, and one at Canterbury, Kent, these have been estimated at 300 or 350 years old. Some assert the Mulberry may attain to the age of 400 years. It is singular to how many of these trees has attached a tradition that Queen Elizabeth sat under them and regaled herself upon their fruits.—C.

### Points about Vines.

In his remarks under the heading, "Seasonable Hints on Vines," page 24, July 10, "H. D." states the following: "In case of a bad attack of red spider which is general throughout the house, a strong fumigating with XL All on two successive nights will usually kill every red spider present." This is quite the contrary to my experience. I have frequently vaporised Melons with XL All compound at double strength to that recommended on bottle, also Black Hamburg Vines at extra strength on successive nights, but I was never able to kill red spider with this otherwise indispensable insecticide. I found also that Adiantum cuneatum, A. Farleyense, Muscats, and Lady Downe's Vines are very seriously injured if vaporised with XL All nicotine compound. Even when the leaves are fairly ripe on these varieties of Grapes, they will curl, and the edges for an inch in depth will dry up. Anyone who has to fill vineries containing these two varieties of Grapes with Chrysanthemums in October can easily put my assertion to the test, if they vaporise the Chrysanthemums in them to destroy green fly, which generally infests these autumn flowering plants after being housed. I had some young Crotons in a propagating case on which were a goodly number of red spiders. In the case was, perhaps twenty cubic feet of space. I put enough XL All compound in the vessel to kill green fly in a 1,000 cubic feet house or pit, and strange though true, the red spider was still alive and frisky when examined next morning. I should be glad if "H. D." would state the size of his vineries and quantity of XL All used, in which he caused red spider to succumb so easily.

A remarkable fact which may interest some readers may be worth noting, and prove that spiders of a larger size are also difficult to kill. After clearing out the early lot of Melons from some heated pits last month, and as a precaution against red spider being present when replanting immediately, we burnt a quantity of flowers of sulphur on some hot coals taken from the boiler fire, and quite filled the pits with the fumes. The same evening, on lifting up the lights, there were two large spiders in their webs in the corners of the brickwork as full of life and vigour as possible. I think the fumes would have suffocated any human being in fifty minutes.—A. JEFFERIES, Moor Hall Gardens, Essex.

## Societies.

### Wolverhampton, July 8th, 9th, and 10th.

Typical King's weather characterised the opening day of this popular Midland horticultural exhibition, and since its inception, fourteen years ago, its popularity has increased, with also a corresponding financial prosperity. The aggregate profits have realised a sum of £6,407 5s. 1d., and the Committee of Management have handed to the Parks and Baths Committee of the Corporation about £4,000 for additions and improvements at the East and West Parks. The prize money was increased to £800, and the entries on the present occasion numbered 736, a record number, the highest previously being in 1899, when there were 734. The exhibits were staged in seven large marquees, and, viewed as a whole, the show was probably the finest ever held at Wolverhampton. It was held in conjunction with the Art and Industrial Exhibition. The public luncheon, held in Connaught Restaurant, belonging to the latter, was presided over by the Mayor (Councillor Plant), and the toast to the judges was responded to by Mr. Owen Thomas and Mr. Richard Dean in apropos sentiments.

The individual features of the show were so numerous and meritorious that it would be almost invidious to particularise. The exhibits, however, as a whole, of hardy garden flowers contributed by competitors and the trade might readily claim the foremost position. The silver challenge trophy, value £25, and cash £5, was won outright by Mr. J. H. White, Woreester, with a magnificent display of cut flowers and plants. Sweet Peas formed another very great attraction, and more especially the splendid collection of the veteran Mr. Eckford. There was an evident marked improvement generally in the arrangement of the Sweet Peas in the vases and glasses, and a decided leaning towards using own foliage or otherwise instead of Maiden-hair Fern fronds. Prior mention of the foregoing subjects does not in the least detract from the excellence of the grand display of Roses. Considering the incidence of the weather, the quality of the Roses on the whole proved superior to anticipation.

Fruit was more numerously represented than usual, excepting, strangely, Strawberries, there being no exhibit in the special competitive class, and only one or two dishes (Royal Sovereign) in the collections of fruit. The black Grape section was very well represented, more especially by the Madresfield Court variety, notably by Mr. S. Barker, gardener to the Duke of Newcastle, Clumber Park, Notts, who had a pair of very fine bunches, with large even-sized berries beautifully finished, in competition for the prizes for any black variety. Unfortunately, however, considerable damage was occasioned to one of the bunches by the accidental upsetting of the box during transit, thus putting the exhibit "out of court," but the judges signified their appreciation of the evident high culture by giving an extra award. Several examples of white Grapes were fairly well staged but the Museat of Alexandria variety—though fine in bunch and size of berry—lacked, probably owing to the long absence of sunshine, that desideratum, the amber colouration, and in this respect were eclipsed by such as Buckland Sweet-water. Peaches and Nectarines were unusually good, both in size and colour. Figs also fine, whilst Melons made a brave show.

Vegetables were numerously staged, and their quality evoked much admiration amongst the visitors.

The trade element, as usual, was greatly in evidence, more especially in regard to plants and cut flowers. Messrs. James Veitch, Chelsea, had an excellent exhibit of their plant specialities. Messrs. Webb and Sons, Wordsley, were represented by an attractive arrangement of Sweet Peas, Gloxinias, *Lilium Harrisii*, Begonias, and hardy garden flowers. Messrs. Richard Smith, Woreester, also contributed a fine exhibit of hardy garden flowers, &c. Messrs. Dickson and Co., Chester, displayed a good assortment of hardy flowers, &c. Messrs. J. Hill and Sons, Lower Edmonton, contributed almost an unique collection of exotic Ferns, forming a highly interesting feature in the show. Messrs. Jarman and Co., Chard, displayed a fine assortment of Sweet Peas, Roses, Begonias, &c. Messrs. George Jackman and Co., Woking (who were new exhibitors here), had a new assortment of Delphiniums, Carnations, and other flowers. Messrs. Hinton and Co., Warwick, a fine collection of Sweet Peas. Mr. John Forbes, Hawick, a superb collection of herbaceous Phloxes and Pentstemons. Messrs. Dobbie and Co. sustained their reputation with a grand exhibit of Sweet Peas, Violas, and Fancy Pansies. Messrs. Blackmore and Langdon, Bath, submitted a superb collection of Begonias. Mr. Bason, of Finchfield, an excellent assortment of Sweet Peas. The Violas of Messrs. Pattison, Shrewsbury, maintained this firm's reputation. Hardy garden flowers were well staged by Messrs. Hewitt, Solihull, Birmingham; whilst such more local growers as Mr. R. Lowe, Messrs. Tom B. Dobbs, and Mr. John E. Knight, all of Wolverhampton, materially contributed with their respective exhibits to the enhancement of this grand

exposition of horticultural produce. Mention also in this respect must be made of the fine group of Caladiums, white Lilies, and Begonias contributed by Mr. Webster, curator of the West Park, and to which a gold medal was awarded. Much credit is also due to him for beautiful designs of carpet bedding and other bedding arrangements, contrasting so pleasingly with the floral contributions beneath the exhibition marquees. Much credit was due to Mr. Barnett, the courteous secretary, and his colleagues for the efficient arrangements of the exhibition.

### The Competitive Exhibits.

Commencing with the schedule of prizes, groups of plants arranged for effect (open to all) come first, and, as might have been expected, Messrs. Cypher and Sons, Cheltenham, were accorded first honours for one of their well-known artistic effects, and so similar have they of late years been in character that to readers of the Journal a detailed description here would prove a superfluity to past readers; sufficient to say that the recent display compared favourably with some of their best former ones, and a similar remark also applies to that of Mr. J. V. Macdonald, gardener to H. Kenrick, Esq., Edgbaston, and who has more than once closely rivalled his formidable antagonists. The third position was accorded the undaunted Mr. W. Vause, Leamington Spa, and whose exhibit lacked comparative floral colouration.

Messrs. Cypher, as usual, were again to the fore with a fine complement of sixteen stove and greenhouse plants (first prize £20), chiefly notable being huge specimens of *Phenocoma prolifer* Barnesii, *Stephanotis floribunda* (very fine), *Statice intermedia*, *Ixora Williamsii*, *Dracophyllum gracile*, *Erica ventricosa*, *Bothwelliana*, *Ixora regina*, *Erica Candolleana*, *Statice profusa*, *Bougainvillea glabra* (fine), *Codiaeum Montfontainensis*, *Codiaeum Chelsoni*, and four large Palms in variety. The second prize was accorded Mr. W. Vause and the third Mr. W. Finch, Coventry, but neither were up to their usual standard of merit. There was only one exhibit in the class for a collection of Orchids, the second prize being awarded to Messrs. Cypher. Exotic Ferns were very well exhibited by Mr. J. V. Macdonald and Mr. R. Sharpe, gardener to H. Lovatt, Esq., Low Hill, Bushbury, the prizes falling as in the order named.

For twenty specimen plants in pots not exceeding 8in Messrs. Cypher were placed first; second, Mr. H. Blakeney, gardener to the new baronet, Sir A. Muntz, M.P., Rugby; and third, Mr. J. V. Macdonald.

For twelve plants, six in bloom, Orchids excluded, Messrs. Cypher and Mr. W. Vause were the respective winners. The winners for a collection of Begonia in pots were Mr. F. Davies (Pershore), Mr. T. G. Baker, and Mr. J. V. Macdonald, all with meritorious examples.

Roses were naturally one of the leading features. For seventy-two distinct varieties the coveted honours fell to Messrs. F. Cant and Co., second Messrs. B. R. Cant and Sons, third Messrs. Harkness, fourth Messrs. D. Prior, and extra prize to the King's Acre Nurseries, making altogether a grand display, and including many of the newest varieties extant.

For forty-eight blooms, distinct, Messrs. B. R. Cant were to the fore, and Messrs. Harkness, Prior, and Townsend (Worcester), as in order named. For eight distinct varieties Messrs. B. R. Cant scored with Frau Karl Druschke, Lady Mary Fitzwilliam, A. K. Williams, Gustave Piganeau, Mr. John Laing, Mrs. Cocker, Ulrich Brunner, and Suzanne Marie Rodocanachi; second Messrs. F. Cant and Co., third Mr. Prior, and fourth Messrs. Harkness. For twelve bunches with foliage and buds as cut from the plants, any varieties, in vases, Mr. G. Prince, Messrs. F. Cant, and Messrs. J. Townsend were the respective winners, making altogether an effective display. For twenty-four distinct varieties by exhibitors not included in the class of seventy-two varieties—first prize £4 (including special prize of two guineas offered by Alderman Craddock)—Mr. G. Prince, Messrs. Perkins and Sons (Coventry), and Messrs. Townsend (Worcester) were the winners as in the order named. In the class for twelve blooms distinctly named new varieties of the last three years—first prize a gold medal value £3 and cash £2—Messrs. B. R. Cant led, second Messrs. F. Cant, and third Messrs. Perkins. Messrs. B. R. Cant's varieties were Liberty, Bessie Brown, Mamie, Ulster, Frau Karl Druschke, Rosslyn, Exquisite, Papa Lambert, Mrs. Cocker, Mrs. Edward Mawley, Duchess of Portland, and Mrs. B. R. Cant.

For twelve dark Roses, one variety, Messrs. B. R. Cant won with comparatively fair blooms of A. K. Williams; second, Messrs. D. Prior; and third, Messrs. F. Cant, with the foregoing variety. For twelve light Roses, one variety, Messrs. T. Townsend, D. Prior, and F. Cant were the respective winners with Bessie Brown.

For twelve blooms of Tea Roses, distinct, Mr. G. Prince was the victor with Mrs. Edward Mawley, Comtesse de Nadaillac, Souv. d'Elise Vardon, Bridesmaid, Maman Cochet, Madame Cousin, Souv. de S. A. Prince, Mons. Furtado, Catherine Mermet, Madame de Watteville, The Bride, and White Maman Cochet.

The second prize was awarded Messrs. D. Prior and Son. For six vases of distinct varieties of Sweet Briars, not more than seven trusses in a vase, Mr. G. Prince was placed first, Messrs. Perkins second, and Messrs. Townsend third. For nine distinct varieties of Teas and Noisettes, to be staged in nine vases, seven blooms of each, Mr. G. Prince was placed first with *The Bride*, *Madame Cusin*, *Souv. de S. A. Prince*, *Bridesmaid*, *White Maman Cochet*, *Souv. d'un Ami*, *Innocente Pirola*, *Maman Cochet*, and others; the second prize to Messrs. Townsend with unnamed varieties.

Bouquets were as a whole well shown, and, in fact, the most uniform display of the kind ever presented for adjudication at Wolverhampton. For a bouquet for the band Messrs. Perkins, Leamington, won the coveted prize with an extremely graceful arrangement of *Odontoglossum crispum* and *Lælio-Cattleya* sprays, and *Asparagus* fringing. The second prize was awarded to Messrs. Jenkinson and Sons, Newcastle, Staffs, for a considerably larger and heavier arrangement, composed of *Odontoglossum crispum*, two varieties, and *Epidendrum vitellinum*, with *Asparagus* fringing; third, Messrs. Tucker and Son, Oxford. For a bridal bouquet Messrs. Jenkinson secured the first prize with an exquisite composition of *Odontoglossum crispum* and pure white

days, the first prize was accorded Mr. T. G. Baker; second, Messrs. Harkness and Son.

Prizes were offered for a group of plants in flower, to consist of one species only to a group. The first prize was awarded to Mr. J. V. Macdonald for a showy lot of *Hydrangea Hortensia*; second, Mr. R. Sharpe, gardener to H. Lovatt, Esq., for a beautiful display of *Malmaison* Carnations; and third, Mr. T. G. Baker, Waterdale, Compton, with *Show Pelargoniums*. It may be remarked that the Carnation group held the highest position in the visitors' estimation, for obvious reasons.

For an arrangement of Sweet Peas for effect, gold, silver, and bronze medals were offered. Messrs. Jones and Son, Shrewsbury, won the gold medal, and Messrs. Gilbert and Sons, Bourne, the silver medal; no other competitor.

For eighteen bunches of Sweet Peas, in distinct variety, the first prize fell to Mr. E. Watkins, gardener to R. Piazzani, Esq.; second, Messrs. Jones and Sons; third, Messrs. Gilbert and Sons; commended Mr. W. Marple, Parkridge. For six bunches of Carnations, not less than three varieties, Mr. J. P. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, won the first prize.

Photo by

Fairburn, Nostell.

Gardener's Bothy at Nostell Priory.

*Phalænopsis*, with *Asparagus* and *Maidenhair Fern* accompaniments; second, Messrs. Perkins with a superb example; third, Messrs. G. and H. Suckling, Wolverhampton. For a bridesmaid's bouquet Messrs. Perkins were to the front with a tasteful arrangement of *Odontoglossum* and *Lælio-Cattleya*; second, Messrs. Jenkinson; and third, Messrs. Tucker.

In the class for an arrangement of hardy border flowers there was a lively contest. Two equal first prizes were awarded to Messrs. R. Wallae and Co., Colchester, and Messrs. Harkness, Bedale; second, Messrs. G. Gibson and Co.; third, Messrs. Barr and Sons, London. Dinner-table decorations were unusually good. The first prize was awarded Messrs. Jenkinson and Sons, the decoration being composed of Orchids, principally arranged lightly and blending exquisitely; the second prize to Messrs. Suckling with a tasty arrangement of pink Carnations, a *Lily of the Valley*, *Smilax*, and *Asparagus* fronds; third, Mr. W. Vause; and fourth, Messrs. Jones and Sons, Shrewsbury.

For a collection of decorative plants and bunches of cut flowers, &c., arranged for effective display on staging, not to exceed 6ft by 4ft, Mr. W. Finch secured the first prize; second, Mr. G. Hancox, West Bromwich; third, Mr. E. Simpson, gardener to C. T. Mander, Esq., The Mount, Tettenhall Wood. For the most tasteful arrangement of Pansies and *Violas* set up in such a way that they will remain in a fresh condition for three

Mr. V. B. Johnstone, Wolverhampton, secured Mr. Henry Eckford's special first prize for twelve varieties of his Sweet Peas, and Mr. W. Shropshire, Market Drayton, got Mr. Robert Sydenham's special first prize of £1 10s. and large silver medal for twelve bunches of his own varieties.

In the gardeners' and amateurs' section, groups of plants arranged for effect were noted for considerable merit. The first prize was awarded to Mr. R. Sharpe, gardener to H. Lovatt, Esq., Bushbury; second, Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston. Mr. Cryer was also successful in several other classes. Mr. E. Simpson obtained the first prize for twelve varieties of cut flowers, stove or greenhouse; and Mr. J. V. Macdonald the second prize. Space prohibits mention of the numerous other exhibits of plants and flowers. The cottagers' classes, as usual, were most creditably represented.

Collections of forced fruits in the open classes were highly creditable. For eight dishes, to include two varieties of Grapes, one black and one white, three bunches of each, one Melon (*Pines* excluded), first prize £10, the first prize was accorded Mr. J. Doe, gardener to Lord Savile, Rufford Abbey, Notts, with grand *Madresfield Court* and *Muscat of Alexandria* Grapes; *Crawford Early Peaches*, *Barrington ditto*, *Violette Hâtive Nectarines*, *Best of All Melon* (fine), *Brown Turkey Figs*, and *Royal Sovereign Strawberries*. Mr. J. H. Goodacre, Elvaston Castle Gardens,

second with very good Black Hamburgh Grapes, Muscat of Alexandria wanting in colour, Brown Turkey Figs, Bellegarde Peaches, Lord Napier and Spencer Nectarines, a large Melon, and a very fine dish of Royal Sovereign Strawberries; the third prize to Mr. R. Dawes, gardener to the Hon. Mrs. M. Ingram, Temple Newsam, Leeds. For four bunches Grapes, distinct, two black and two white, there was a keen competition, and first honours were awarded to Mr. J. Doe, gardener to Lord Savile, with an excellent exhibit of Black Hamburgh, Madresfield Court, Muscat of Alexandria, and Foster's Seedling; second, Mr. S. Barker, gardener to the Duke of Newcastle, Clumber Park, with very good examples of Black Hamburgh, Madresfield Court, Buckland Sweetwater, and Foster's Seedling; third, Mr. J. Read, gardener to Earl of Carnarvon, Brethby Park; and fourth, Mr. T. Bannerman, gardener to Lord Bagot, Blithfield Hall. For two bunches black Grapes the first prize fell to Mr. W. Dawes, gardener to Lord Trevor, Chirk Castle, with two superb bunches of Black Hamburgh, large in berry and of perfect finish; second, Mr. J. Doe, with grand examples of Madresfield Court; third, Mr. J. Leadbetter, with fine Black Hamburgh; and fourth, Mr. S. Barker.

For two bunches of white Grapes Mr. J. Doe scored with remarkably fine Muscat of Alexandria so far as bunch and berry were concerned as to size, and very well ripened considering the season; second, Mr. R. Lawly, gardener to W. Darby, Esq., Baschurch, Salop, with very fine examples of Buckland Sweetwater, thoroughly ripened; third, Mr. S. Bremmell, gardener to H. H. France Hayhurst, Esq., Wellington, Salop, with Muscat of Alexandria.

For a green flesh Melon Mr. T. Somerford, gardener to the Earl of Shrewsbury, Ingestre Hall, Staffs, was awarded the first prize for Earl of Latham variety; second, Mr. J. Read, with Countess; third, Mr. J. H. Goodacre. For a scarlet flesh, Mr. R. Dawes, with Scarlet Seedling, was awarded the first position; second, Mr. T. Bannerman; and third, Mr. J. Read.

Peaches were pretty numerous, and of very good colour. Mr. T. Bannerman scored with a finely coloured dish of Royal George; second, Mr. W. L. Bastin, gardener to Sir Alexander Henderson, M.P., West Stafford; third, Mr. F. Somerford. For six Nectarines, Mr. J. Read won with highly coloured Violette Hâtive; second, Mr. J. Doe, with Lord Napier; and third, Mr. T. Bannerman with Violette Hâtive. For three dishes of Tomatoes Mr. J. Read led with Magnum Bonum; Mr. G. Gibson, gardener to R. W. Hudson, Esq., Marlow, second; and Mr. B. Ashton, third.

In the gardeners' class prizes were offered for a collection of six varieties of fruit (Pines excluded). Mr. T. Bannerman further distinguished himself by securing the first prize with fine examples Black Hamburgh, Muscat of Alexandria Grapes, Royal George Peaches, Lord Napier Nectarines, Brown Turkey Figs, and a Lord Latham Melon; second, Mr. J. Read; and third, Mr. J. H. Goodacre.

For a collection of ten varieties of vegetables Mr. E. Beckett, gardener to Lord Aldenham, Elstree, scored with beautiful examples of Sutton's Magnum Bonum Cauliflowers, Green Globe Artichokes, New Red Carrots, Perfection Vegetable Marrow, Early Snowball Turnip, Edwin Beckett Peas, Canadian Wonder Beans, Ideal Potatoes, Tomatoes, and Onions. Second, Mr. J. Gibson, gardener to R. W. Hudson, Esq., Marlow, with also an excellent exhibit; and third, Mr. W. L. Bastin. Special prizes for vegetables were offered by Messrs. Sutton and Sons, Reading, for the best collection. Mr. J. Gibson was placed first with a remarkably fine lot; second, Mr. B. Ashton, gardener to Earl of Latham; third Mr. W. L. Bastin; fourth, Mr. J. Reed; and fifth, Mr. W. Waldron, Kingswinford. In competition for Messrs. Webb and Sons' prizes Mr. W. L. Bastin was first, Mr. E. Beckett second, Mr. J. Read third, and Mr. R. A. Newell, Wellington, fourth.—W. G.

#### Medals Awarded and Certificates.

**GOLD.**—Messrs. Dobbie and Co.; Messrs. J. Veitch and Sons; Messrs. E. Webb and Sons; Mr. Henry Eckford; Messrs. T. Hill and Sons; Mr. L. J. Ching; Mr. Webster, superintendent, West Park, Wolverhampton; Messrs. Blackmore and Langford; Messrs. Richard Smith and Co., Worcester; and Messrs. Dickson, Chester.

**SILVER.**—Mr. Robert Sydenham, Birmingham; Messrs. Howitt and Co., Birmingham; Messrs. Geo. Jackson and Son, Woking; Messrs. Hinton Bros., Warwick; Messrs. Jones and Sons, Shrewsbury; Messrs. Jarman and Co., Chard; Messrs. Tom B. Dobbs and Co., Wolverhampton.

**BRONZE.**—Mr. W. L. Pattison, Shrewsbury.

**CERTIFICATES OF MERIT.**—The Vineries, Limited, Acocks Green; Mr. W. Waters, Acocks Green.

**CERTIFICATED PLANTS.**—Messrs. Dobbie and Co., Rothesay, for Sweet Peas White Queen, Jessie Cuthbertson, and Britannia; Messrs. Hill and Son, Edmonton, for Pteris Wimsetti multiceps; Mr. Robert Greenfield, jun., Leamington Spa, for Asparagus myriocladus.

### Beckenham Horticultural, July 9th.

Situated in a very good district, and having the support of all the residents, the committee and other officials of this society generally find success attending their efforts. They provide a varied programme of events in connection with the show, having a good military band, horse-leaping, &c., and in other ways do what they can to provide amusement. The summer show, held on Wednesday, July 9, was good in all respects, and the day was fine at first but rained heavily in the afternoon. Lord Raglan opened the exhibition at 2.30. An hour earlier the committee, judges, exhibitors, and friends of the society met at luncheon.

Class 1, for a group of plants arranged for effect, brought out a number of exhibits, but Mr. W. Potter's group (gardener, Mr. Cogger), of Stinside, Lawn Road, was incomparably superior to the others. *Humea elegans* and *Gloriosa superba* furnished a light back to the group, and brightly coloured *Crotons* in varieties formed the body of the arrangement. We noticed *Miltonia vexillaria*, *Thunias*, *Dendrobium densiflorum*, and *Selenicpeidium grande*, all of them good samples, and the racemes of *Francoa ramosa*, the *Cannas*, and fine *Gloxinias* further contributed toward furnishing an effective group of plants. Second award fell to Mr. D. Spearer (gardener, Mr. T. Hopkins), South Lowe, Chislehurst, with a heavy, dull display. For a lesser group of plants in Class 2 the premier award was deservedly carried off by Mr. J. Boyle Woodey, Selwood, Hayne Road; second, Mr. C. Termin, Langley Road; and third, Mr. Bartholomew, Grassington, Hayne Road.

Mr. E. J. Preston, Kelsey Park, carried off leading honours for six table plants, and they were well grown, though everyday sorts; and Mr. W. C. Gunn was second. Mr. Boyle Woodey led for three of the same, and Mr. W. Rogers came second. With half a dozen fair *Gloxinias* Mr. M. Bartholomew easily beat his opponent for three flowering stove or greenhouse plants, with Mr. Gunn second.

*Achimenes* were only staged by two entrants, but their quality was very superior, notwithstanding the slack competition, and Mr. Potter's plants, in large pans, were literally massed with blooms. For three *Zonals*, well-grown on the whole, but rather poorly flowered, Mr. H. Crowther, Broadclyst, Wickham Road, received first prize; while for three Ivy-leaved *Pelargoniums* (or *Geraniums*, as they are wrongly named in the schedule) he also led. His varieties *Galilee* and *Souv. de Chas. Turner* were effective, though not developed to the fullest.

It is a delight to see *Fuchsias* at their best, and good plants demand great patience for their culture and training. Here, in Class 16, Mr. W. Cobbett, of Winterdyne, Lawn Road, beat Mr. J. Moreland, each with creditable plants. For one specimen plant in flower (Class 9) Mr. H. F. Simonds, Woodthorpe, Southend Road, was in advance with a well-flowered hybrid *Cattleya*; and second Mr. Crowther, with *Odontoglossum luteo-purpureum*, with a fourteen-flowered raceme.

Ferns are evidently favourites down Beckenham way, and many really good representative plants were on view. For three exotic species Mr. W. Rogers was in the run, with Mr. Boyle Woodey second. The former staged a very fine *Lygodium*. For four distinct ditto Mr. Potter again won, and his *A. Farleyense* was a perfect specimen. Mr. W. Cobbett came second with good but smaller Ferns. Specimen foliage plants were poor, the first award in Class 10 going to Mr. E. J. Preston with a huge *Cycas*; second, Mr. Simonds, Woodthorpe, with *Anthurium crystallinum*; and third, Mr. Crowther, with a large basket containing *Asparagus Sprengeri*. In Class 12, also for a specimen foliage plant, Mr. Woodey led with a typical *Dracæna* (*Cordylina*) *Veitchii*, and Mr. Moreland second with a *Kentia*. Mr. A. Baker, Elderslie, beat Mr. Fergusson, Storthholme, Rectory Road, in Class 8, for six miscellaneous plants, and each showed well-grown plants, comprising *Anthurium Scherzerianum*, *Croton Heathi elegans*, *Acalypha hispida*, *Hydrangea Hortensia*, *Cobœa scandens*, *Calocasia antiquorum*, and *Begonias*. Mr. A. Baker's *Selaginellas*, in Class 25, were really attractive; and Mr. Thompson's four plants (Class 7), which beat those of Mrs. Clark, were also worthy of notice. In Class 11 Mr. J. Moreland had the best specimen flowering plant—a good *Lantana*. For three flowering stove or greenhouse plants Mr. A. Barker deserved the premier place, which he won, with really fine *Hydrangea*, double *Tuberous Begonia*, and *Anthurium*, Mr. Simonds following.

The *Petunias* entered for Class 23 were fine samples of culture, and Mr. Thompson, Lindifferon, Rectory Road, must have felt proud of his victory. The *Begonias* were very large and inclined to be ungainly, though Mr. Crowther's three in bloom, taking first in Class 15, were creditable, though the flowers were hardly expanded. Mr. Thompson's specimen *Fuchsia* stood nearly 6ft high, and tapered conically in fine form; second, Mr. Moreland. The latter had it all his own way for a couple of *Coleus*, and seldom have we seen better

plants at any local show. Mr. Crowther came second with good samples.

#### Roses, &c.

In Class 50, for the forty-eight distinct varieties, the leading honours went to Messrs. Bunyard and Co., of Maidstone, with fair average blooms; and second, Messrs. G. and W. H. Burch, Peterborough. Four entered. Messrs. Burch were first in the succeeding class for the eighteen H.P.'s in twelve varieties, and staged an even set; Messrs. Bunyard came second, and Mr. E. Anderson, Shirley Cottage, Shirley, third. Messrs. D. Prior and Son, Colchester, led in Class 52, for eighteen Teas and Noisettes, by far the best bloom being Maman Cochet; and second, Messrs. Bunyard. Mr. A. Merridew, gardener at Shirley Cottage, beat Mr. Herbert Rogers for twelve Roses in six sorts.

Shirley Poppies with a class to themselves we have not previously seen at a show, but the beauty of the flowers undoubtedly deserves such special recognition. Mrs. Stilwell, 14, Southend Road, led for three vases, and Mrs. Vincent, The Pines, followed second. Sweet Peas made a brilliant display, and Mr. W. H. Stone, Donnington, Sydenham, was first for a dozen distinct sorts. For a collection of six kinds of Salads Mr. F. Sinnock was first.

Fruit and vegetables were a minor feature. For two bunches of black Grapes Mr. Preston led, and for a collection of four dishes of hardy fruits the first award went to Mr. Moreland. For three dishes of the same Mrs. Clark was first. For the dish of Peaches or Nectarines, first, Mr. Bayer. A collection of Strawberries from Mr. E. J. Preston, Kelsey Park, received a commendation.

#### Trade Exhibits.

Messrs. Surman, Victory Nursery, Beckenham, staged a large group of their fine strain of Petunias, and were awarded a silver-gilt medal.

Being within a get-at-able distance from Beckenham, the Messrs. Laing, of Forest Hill, London, exhibited somewhat largely, and among other things we noted how fine were their Streptocarpus of the multiflora hybrid strain; also their double Begonias, Gloxinias, and Caladiums. For this group they received a silver-gilt medal. They had also a very large assortment of cut Rose blooms and garden Roses in bunches, Mrs. John Laing being very prominent. Hardy plants were also contributed.

Messrs. Cannell and Sons, Swanley, set up a group of the far-famed Cannas ("Cannell's Cannas"), among which were the varieties Osear Dannecker; Duke Ernst, Mrs. G. A. Stroblein, and Victory. The new Kochia scoparia lined the front. Near by they had a table of border flowers. (Silver-gilt medal.)

Some delightful floral arrangements, executed with great taste, came from Mr. J. Horsman, Beckenham, and received a silver medal.

Messrs. Carter, of High Holborn, had a large collection of hardy flowers, among which Delphiniums were prominent. (Silver medal.)

Mr. Bates, gardener to Mr. E. Dennis, staged a magnificent group of Gloxinias, and was awarded a silver medal.

A miscellaneous group of flowering and foliage was contributed by Mr. G. E. Day, gardener to Mr. H. F. Simonds, receiving a silver-gilt medal.

Mr. John R. Box, West Wickham and Croydon, staged a lovely group of single and double-flowered Tuberous Begonias, those with light colours and fimbriated edge being most admired. He also had hardy Alpine plants and herbaceous cut flowers.

Messrs. Bunyard and Co. contributed garden Roses and good hardy flowers, and were awarded a silver medal.

Towards the south end of one of the large tents Messrs. J. Peed and Son, West Norwood, London, set up an exceptionally fine group of Caladiums, well grown and well staged. Their Silver Cloud, Mrs. Harry Veitch, Arassanhy. Ernst Nenbert, and Golden Queen, among others, were charming.

### Thornton Heath, July 9th.

Unfortunately for the success of the second annual Rose and general horticultural exhibition, the rain which fell just after five o'clock practically spoilt all interest or enjoyment of it. The Rose section was devoid of any support from the nurserymen, who were exceedingly busy during last week. The amateurs' and gardeners' classes, however, were strongly supported on the whole. Fruit and vegetables were placed in two separate tents, and some very good entries were noticeable, although we failed to find a representative collection of vegetables, the best (six kinds) coming from Mr. W. Child.

In Class 5 for twelve H.P. Roses, distinct, the N.R.S. bronze medal and 15s. as first prize, was secured by Mrs. West, Rydal Grange Road, Sutton, the best blooms being M. Verdier and Clio; second award became the property of Mrs. W. H. Lascelles,

Sydenham Road, Croydon, with strong blooms, which must have run the first set very closely; third came Mr. G. A. Schofield, of Sutton. There were five entries.

Mr. J. Heading's four distinct Roses, three trusses of each, were judged superior to those of Mr. G. Prebble, gardener to Miss Thrale, of Shirley, but neither were very striking. Nine competitors came forward in Class 8, for six H.P.'s, the premier place being filled by Mr. K. H. Gifford, of Edenoor, Sutton, with good samples of Francois Michelin, Mrs. J. Laing, Suzanne Marie Rodocanachi, Horace Vernet, Her Majesty, and Comtesse de Ludre. Mr. Herbert Molyneux, 75, Galderden Road, Balham, followed second with good Killarney, Charles Lefebvre, and Duke of Wellington.

Eight competitors ranged up for the six distinct Teas, but all were small in size, though mostly of good form and colour. Mr. West was first with Innocente Pirola, Maman Cochet, The Bride, Bridesmaid, White Maman Cochet, and Mrs. Edward Mawley. The succeeding place was awarded to Mr. Lascelles, and third Mr. Schofield. Again nine entrants contested the merits of their blooms in Class 10 for six flowers of one sort, the premier honour eventually falling to Mr. K. H. Gifford with superb blooms of Mrs. John Laing. These were of moderate size but of splendid form and good colour. The silver medal for the best bloom in this division also fell here. Mr. Lascelles came next with the same variety, but the blooms were much weaker; and third Mr. West, again with Mrs. J. Laing.

The groups of plants compared favourably with those seen at other local exhibitions, there being eight altogether, the first place being captured in Class 9, by Mr. J. Galvin, gardener to H. Butcher, Esq., of Purley. There were no fewer than seventeen tables of floral decorations, which goes to prove how great an interest the ladies take in their flower show. Class 64A, also for table decorations by gentlemen. Miss May Dart won in the larger Class (59) for table decorations, but her arrangement seemed somewhat too thick and heavy, with a superabundance of pink Sweet Peas and grass. The second award we could not discover, and third Miss West. For the following class Miss Pearson beat Miss M. Dart for a bouquet, she using Niphetos Roses, and Miss Dart had mauve and white Sultans. For three gentlemen's buttonholes Mr. T. Cook, jun., displayed the better skill, and Miss Fenn followed second. This gentleman, however, was second to Miss Dart in Class 64A, with a decorated table, the former employing Shirley Poppies alone, and Mr. Cook used pale lavender Sweet Peas, which furnished a cool and pleasing feature. For two ladies' sprays, Miss M. N. Hill beat Miss West.

Hardy flowers and Sweet Peas filled the whole of one long side of the large tent, the best collection being that in Class 56, from Mr. W. E. Carr, 78, Windmill Road, who included Epilobium angustifolium, Centranthus longifolius, Spiraea palmata, Gladiolus The Bride, and other choice border flowers. He was also first in Class 35, under Division II., for another collection.

The entries for Sydenham's prizes offered for Sweet Peas were not at all so attractive as they might have been, there being no white paper beneath the vases, and instead of being glass vases, they were earthenware. A strong competition resulted all the same, and some fine bunches were displayed.

The plants furnished a centre of interest, the six Ferns in Class 29 securing first prize being thoroughly good samples. Miss Mortimer, of Neil Lane, was the winner, and staged a fine Lomaria gibba, one good Dicksonia squarrosa, and a representative Adiantum Pacotti. Miss Perrett's six Fuchsias in Class 18, however, were small. Other exhibits did not call for special attention.

#### Trade Exhibits.

Mr. Henry Eckford, of Wem, Shropshire, was present with a display of Sweet Peas all beautifully arranged, and which furnished one of the great features of the exhibition. Set up in tall glasses tier above tier, over white paper, the bunches were delightful, and we noticed the new pure white Dorothy Eckford, a white seeded variety, which comes consistently true, and is certainly the best white now extant. There were also Othello, Emily Eckford, Gorgeous, Miss Wilmott, Prince Edward of York, Peach Blossom, Captain of the Blues, Hon. E. Bouverie, Mars, Lady Gresil Hamilton, Princess of Wales, George Gordon, and Black Knight among others. (Silver medal.)

Mr. G. H. Cooper, Sydenham Road, Croydon, staged a handsome group of well-flowered Show Pelargoniums; a very creditable display.

From Mr. C. A. Blogg, Brighton Road, came a collection of Caeti.

Mr. McArthur, Flower and Vegetable Gardens, Thornton Heath, contributed Cupid Sweet Peas in pots, showing their suitability for small gardens. He had also a display of Strawberry fruits and cut flowers, such as Sweet Peas, Delphiniums, Shirley Poppies, and Pelargoniums. His new Zonal Pelargonium Mrs. McArthur, with white centre and bright scarlet-crimson edge, is very showy.

### Ipswich, July 9th.

This show which was held as usual of late years in the Upper Arboretum, was unfortunate in the matter of weather. A smart shower fell in the morning, and from about 4 p.m. it rained steadily till dark. The society is by no means so popular or well patronised as it should be in such a place as Ipswich, at the best of times, and I fear the very small amount of gate money received will have a bad effect upon the finances.

Competition in the Rose classes was very poor; in the open classes Messrs. B. R. Cant and Co. were almost the only exhibitors. The quality of the blooms exhibited by this firm was pretty good. In the thirty-six the new Ben Cant was noticeable, and also the new Frau Karl Druschki, which looks like being quite the best white H.P. in fine weather; Marie Baumann and Xavier Olibo were also fine. The new Exquisite H.T. did not look like a very good show Rose. In trebles, besides the varieties named, Papa Lambert H.T. was conspicuous, wanting one more day of dry heat to be fine indeed. And there was also good trebles of S. M. Rodocanachi, Fisher Holmes, and Gustave Piganeau. The same firm had also no competitor in twelve Teas, which were indifferent. In six similar Roses the same exhibitor won with S. M. Rodocanachi, Mr. R. C. Notcutt being second with Marquise Litta—often a disappointing Rose to show. In garden Roses Messrs. B. R. Cant and Co. were again first; L. Holden, Esq., second.

These was competition in the amateur classes, but it was principally confined to two exhibitors. In 24 Rev. A. Foster-Melliar was first with a huge Mildred Grant a little split in the centre, and Horace Vernet, Dr. Andry, and Comte Raimbaud in good condition; Rev. H. A. Berners was second with good samples of Horace Vernet and Mrs. W. J. Grant. In twelve Teas Mr. Foster-Melliar was first, having good samples of Souv. d'Elise, Bridesmaid, Anna Olivier, Madame Cusin, and White Maman Cochet; Mr. Berners was second, having Maman Cochet and Madame Cusin as his best. The same order was observed in six trebles, Mr. Foster-Melliar having a very good triplet of Madame Cusin (which likes hot weather), Kaiserin A. Victoria, and White Maman Cochet; Mr. Berners showed a good triplet of Mrs. Sharman Crawford; the Hon. W. Lowther was third. The procession continued in the same order in twelve Roses, Mr. Foster-Melliar showing François Michelin, Comte de Raimbaud, Bessie Brown, and Catherine Mermet well. Mr. Berners had a very good Duke of Edinburgh and a nice A. K. Williams, and Mr. Lowther had Kaiserin A. Victoria as his best. In six H.P.'s of one variety Mr. Berners was first with Mrs. Sharman Crawford, Mr. F. Corder second with Ulrich Brunner, and Mr. Foster-Melliar third with Marquise Litta. In six Teas of one variety Mr. Berners was first with Madame Hoste and Mr. Foster-Melliar second with Mrs. E. Mawley (which likes cooler weather). In another class for twelve Roses Mr. Foster-Melliar was first, having Catherine Mermet as his best, and Mr. Corder second.

The display of garden Roses was not very good, and in the amateur classes many of the bunches were not named. I noticed, however, one that was. It was in an exhibit where the glass jars for the Roses had evidently been previously devoted to other purposes—a bunch of white Polyanthas was very clearly and distinctly labelled "Blackberry Jam."

Herbaceous flowers were a great feature of the show, particularly the class for thirty-six bunches, in which Mr. C. Jacobi, Henley Road Nurseries, Ipswich, was placed first with a very bright assortment. Iris Monnieri, Delphinium Jacobi, Heuchera macrantha, and Oenothera speciosa being the most noticeable bunches. Mr. R. C. Notcutt was second with a collection, but slightly inferior, his best bunches being Campanula persicifolia Morrheimi, Gladiolus delicatissima, and Agrostemma Walkeri.

Sweet Peas made an interesting display. For twelve bunches Mr. E. Abbott, Ardleigh, was first, having Lovely, Othello, Queen Victoria, Earliest of All, Salopian, Lady Grisell Hamilton, Lady Mary Currie, Navy Blue, Prince Edward of York, Aurora, Duke of Westminster, and Lottie Hutchins. Mr. A. Creek, gardener to Sir Cecil Domville, The Chantry, Ipswich, was second with a stand in which the new varieties Coccinea, Miss Wilmott, and The Hon. Mrs. Kenyon were conspicuous.

Pot plants were, on the whole, poor, and call for no special comment. Competition was good in the fruit classes, some fine Grapes, Peaches, Nectarines, and Strawberries being staged.

For a collection of fruit Mr. W. Messenger, gardener to Mr. C. H. Berners, Woolverstone Park, was first with Black Hamburgh and Foster's Seedling Grapes, Ne Plus Ultra Melon, Dymond Peaches, Pineapple Nectarine, and Brown Turkey Figs. Mr. J. Barson, gardener to the Earl of Sandwich, Hitchingbroke, Huntingdon, was second. Other prizewinners in the fruit classes were Hon. W. Lowther, Campsea Ashe; Sir C. Domville, Mr. D. Ford Goddard, M.P., and the Right Hon. James Round, M.P.

Messrs. W. Cutbush and Son, of Highgate, staged a fine lot of cut Carnations, not for competition. These included Cecilia, the lovely new yellow border kind, and several fine Malmaisons, such as Mrs. Trelawny, Nautilus, and Lady Rose.

Mr. R. C. Notcutt put up a small group of the new annual *Arctotis grandis*, which did not appreciate the wet weather, the flowers remaining closed all the afternoon. Many beautiful designs were noticed among the table decorations which space will not permit us to describe.—E. C.

### Woodbridge, July 10th.

This very popular show, so thoroughly well supported by the good people of Woodbridge, has earned quite a reputation for its good fortune in the very important matter of weather. In more than twenty years I think I can only recall one occasion on which rain fell, and then but slightly; but it was a heavy and severe thunderstorm which visited the show ground at the most critical time for visitors (about 3.15 p.m.), and I am afraid the whole business must have suffered considerably in consequence.

There was a good competition in all the Rose classes, and the standard was fairly high. In the open section the three Colchester nurserymen competed, though most, if not all of them, were also exhibiting at Brentwood or elsewhere. For the handsome challenge cup (thirty-six Roses) Messrs. B. R. Cant and Sons were first, having Mrs. J. Laing, Mrs. Cocker, Xavier Olibo, A. K. Williams, and Marie Van Houtte (grand in size and colour) as their best flowers. Messrs. D. Prior and Son followed quite closely with good examples of Mrs. J. Laing, Comte de Raimbaud, Duchesse de Morny, and Charles Darwin. Messrs. F. Cant and Co. were third with rather smaller and more passée flowers, among which a good Killarney might be seen. For twenty-four, however, this exhibitor was first, having in this box a very fine, though not extra, large specimen of Mildred Grant, and Mrs. Cocker and Fisher Holmes good. Messrs. D. Prior and Son were second, with Bessie Brown and Mrs. J. Laing as best, and Messrs. B. Cant and Sons third, showing a really fine Le Havre and a good Marie Baumann. In twelve Roses Messrs. B. Cant and Sons were first, Marie Baumann, Frau Karl Druschki, and Bessie Brown being among their best; Messrs. D. Prior and Son were second with a fine Maman Cochet, and Messrs. Frank Cant and Co. third. The latter was the only exhibitor of garden Roses in this section, and a very good exhibit it was.

Five amateurs showed stands of twenty-four, Mr. Orpen being first with small blooms, fairly neat and clean, but by no means up to his standard, his best Roses being presumably at Brentwood. White Maman Cochet was probably his best. Mr. Foster-Melliar was second, White Lady and Muriel Grahame being his best. Among the six exhibitors of twelve Roses Mr. Foster-Melliar was first, Charles Lefebvre, Catherine Mermet, and Mrs. E. Mawley being good; Mr. Orpen was second with Madame Cusin and Comtesse de Ludre in good order and Mr. Curtis, of Wormingford, third. Seven amateurs showed six Roses, Mr. Orpen being first, Mr. Cook (of Birch) second, and Mr. Foster-Melliar third.

There was this year no class for dissimilar Teas, a strange omission for a show like Woodbridge. I do not remember ever attending a Rose show before where there was no class for Teas. For six Teas of one variety Mr. R. Steward was first with Mrs. E. Mawley, Mr. Orpen second with Madame Cusin, and Mr. Curtis third with Maman Cochet. The competition was good in this class. In garden Roses Mr. Orpen was first, and Miss Youell second with a poorly arranged stand.

There was good competition and a fine exhibition in all sections of the show, the decorations being, as usual, a popular feature. Some may perhaps think that this sort of thing may be rather overdone, and probably the omission in future of such classes as "best decorated plate handles, ribbons allowed," and "most tastefully floral decorated lady's sunshade, suitable for garden party, ribbons allowed," would not cause Woodbridge Show to suffer from any loss of dignity.—W. R. RAILLEM.

### Bath, July 10th.

The fates of this popular society was found once again, on the 10th, in an element of uncertainty as regards weather. The morning after the heavy storms of the previous day was of a fitful nature, alternating between sunshine and cloud, and the concern of the executive was manifested in the frequent inquiry of the prophets, Are we to have a fine day? This unfortunately was in part denied them, for the early afternoon found thunder, storm, and wind, each in effort thwarting would-be patrons in their venture to review the exceedingly fine show of flowers prepared by so many willing and interested hands.

There were unanimous exclamations of the great excellence and extent of the Rose display. Indeed, Bath excelled itself, despite the untoward weather of such long standing.

The reputation of the Ireland Roses were well maintained. Once again the Messrs. A. Dickson and Sons, Newtownards, carried off the principal prizes for seventy-two varieties and thirty-six trebles. In the first-named there were a great evenness of bloom and freshness and diversity of colour, while variety embraced some of the firm's own introductions and novelties. The following kinds were staged:—A. K. Williams, Innocente Pirola, Shardon, Comtesse de Turenne, Marquis de Litta, Caroline Testout, Chas. Lefebvre, Lady Clanmoire, Ulrich Brunner, Margaret Dickson, Marquis of Dufferin, Tom Wood, Gladys Harkness, Tom Mills, Horace Vernet, Edith D'Ombrian, Mamie, Lady Arthur Hill, Kaiserin A. Victoria, Duke of Wellington, Bertha Gieman, Marie Baumann, Merville de Lyon, Mrs. J. Laing, Duchess of Portland, Marie Rady, Madame G. Luizet, Duke of Teck, Florence Pemberton, Louis Van Houtte (fine), lady Ashtown (new), Mrs. R. G. Sharman-Crawford, Duc de Rohan, G. Piganeau, Avoca, S. M. Rodocanachi, Mildred Grant (Silver Medal N.R.S.), Liberty, Souv. de S. A. Prince, Général Jacqueminot, Danmark, Ed. Herve, Marchioness of

**Cypella Herberti.** (See page 56.)

Downshire, Heinrich Schultheis, Killarney, Xavier Olibo, Mrs. Cocker, Duchess of Bedford (fine), Her Majesty, Alfred Colomb, Mrs. Ed. Mawley, Earl Dufferin, Ernest Metz, Madame Delville, Medea, Mrs. W. J. Grant, Countess of Caledon, François Michelin, Baroness Rothschild, Prosper Langier, White Lady, Beauty of Waltham, Ulster, Comte Raimbaud, Robert Scott, Dr. Andry, Ledbury, Alphonse Soupert, and Bessie Brown (extra). The King's Acre Nurseries, Limited, was second, their best blooms being Lady Sheffield, Madame Chas. Wood, Reynolds Hole, Sultan of Zanzibar, Horace Vernet, and Abel Carrière. Messrs. Cooling, Bath, were third; Victor Hugo and Gladys Harkness in this stand were extra fine. There were seven entries.

In the succeeding class there is necessarily a repetition of the foregoing names, which the Messrs. Dicksons staged in their well-known form, the most striking blooms being Mrs. W. J. Grant, A. K. Williams, Caroline Testout, and Louis Van Houtte, the latter extra fine. Again the King's Acre Nurseries, Limited, were a good second, Marie Rady, Jean Ducher, Duke of Fife, Mildred Grant, and Kaiserin A. Victoria representing the best. Messrs. Cooling took the remaining prize. For eighteen trebles

Mr. George Prince, Oxford, well won the first prize, which included fine Maman Cochet, Mrs. Grant, Fisher Holmes, The Bride, Madame de Watteville, White Maman Cochet, Innocente Pirola, Bridesmaid, Bessie Brown, and Marie Baumann; second, Mr. John Mattock, Oxford, with Amazon, Le Havre, Muriel Grahame, Marie Rady, Medea, and White M. Cochet as his finest; third, Messrs. Townsend and Sons, Worcester. The latter were in good form in the next class for thirty-six distinct, staging J. Dickson, Tom Wood, Killarney, Clio, Capt. Hayward, Bladud, Mrs. Crawford splendidly. Mr. George Prince followed closely, Reynolds Hole being a conspicuous blossom in his stand. Mr. J. Mattock was an excellent third.

Mr. G. Prince scored again in a class of eighteen distinct Teas or Noisettes, and with a fine bloom of Ernest Metz won the silver medal of the N.R.S. for the best bloom in that section. Golden Gate was another striking flower in this stand. Mr. J. Mattock staged well for second place, Princess of Wales, Souv. d'Elise Vardon, Bridesmaid, and Etoile de Lyon being conspicuous flowers. Messrs. Dicksons were third among several other exhibits.

Staged in vases with long stems, twelve varieties, five of each, made a distinct feature, Mr. Mattock leading with good blooms of Mrs. Laing, Catherine Mermet, Maman Cochet, Louis Van Houtte, The Bride, and Muriel Grahame. Mr. G. Prince was second with a well-arranged exhibit, unnamed; third, Mr. Geo. Mount, Canterbury. With twelve single trusses of any Rose Messrs. Dicksons won with fine blooms of Mildred Grant; Messrs. Townsend and Son second. Messrs. Tresseder and Sons, Cardiff, and J. Mattock won with Medea the prizes given for twelve yellow varieties. Messrs. G. Mount and Dickson, with Général Jacqueminot and Tom Wood, took the prizes for twelve crimson Roses. Mildred Grant, for Messrs. Dickson, proved the winner among new Roses, six trusses.

In the amateurs' division there were some noteworthy stands, the best twenty-four distinct varieties coming from Conway Jones, Esq., Gloucester, and with a fine bloom of Prince Arthur secured the silver medal of the N.R.S.; A. Hill Gray, Esq., Bath, second, in whose stand Princess Beatrice was a noteworthy bloom; third, Mrs. R. Rust, Swanswick. For twelve trebles the same positions were held by the foregoing exhibitors, and with eighteen distinct varieties Mr. R. Foley Hobbs, Worcester led the way. Several other classes were represented by local growers, and it is worthy of note that no inferior stand in the open or amateur sections were on view.

Begonias and Strawberries are amalgamated in the title of the Bath Summer Show, and though the former in a competitive sense was no great feature, Messrs. Blackmore and Langdon's exhibit was sufficient justification for the co-equality. Their double blooms, a foretaste of which has been already reported from the R.H.S.'s Holland Park festival, and well illustrated in a recent number of this Journal. Briefly, they were superb. The Rev. Yorke Faucett was the principal exhibitor of both single and double specimen plants and also cut blooms, Mrs. Sims, also of Bath, taking other prizes.

Strawberries were finely staged, every dish having a high merit. For six dishes Mr. J. Ricketts won in a keen contest, Messrs. Porter and E. J. Ricketts being made equal second. Mr. W. Vilven, Bathford Nurseries (Mr. Button manager), staged in finely developed berries the new Trafalgar, Climax, and Royal Sovereign, the Messrs. Ricketts sharing the remaining honours with good fruit. In the single dish Mr. C. Burridge put up the finest dish of Sir Joseph Paxton we have seen for a long time. Leader produced the heaviest fruit in a class for twelve berries.

Decorated tables by lady competitors numbered twelve, which made a fine floral feature. The same tent accommodated Sweet Peas in great perfection, bouquets and baskets of Roses, vases of Roses, sprays for ladies' wear, and herbaceous flowers, all in great profusion and finest quality. The garden Roses must not be omitted from these in dressed tables. Bunches of separate sorts, single and moss kinds, all contributed to the splendour of the Queen of the West, a title given the largest tent. In these Messrs. Cooling again proved invincible. Such exhibits, displayed as they are so well, are more fascinating even than the more conventional show bloom to a large section of the garden lover and public patron.

Non-competitive exhibits occupied much space, Mr. Godfrey, Exmouth, staging Cannas, Carnations, and Zonal Pelargoniums in pots; Sweet Peas, Campanulas, Delphiniums, and Phloxes in a cut state; and, needless to say, all of high standard. Messrs. House and Son, Westbury-on-Trym, had a large exhibit of their newer Sweet Peas, herbaceous flowers, Violas, and Pansies, including an intensely interesting vase of the old double black Pansy.

Much credit devolves on Messrs. Pearson and Jeffery, who, with their chairman of committee, R. B. Cater, Esq., guide everything with smoothness and business-like tact, and the popularity of the Bath Shows, despite frequent untoward weather, is well maintained.

### Southend (Essex) Rose, July 12th.

The Rose exhibition on Saturday last held, for the first time at Southend, we believe, though of small compass, was of the very highest merit. The first class, for forty-eight blooms in the nurserymen's section, brought forward better flowers than have been seen by us at any Rose show this year, the metropolitan exhibition of the N.R.S. included. It was an instance of a battle of the giants, and these almost alone, with no detractors. The prizes were sufficiently good to attract the best men, and Southend is both get-at-able and interesting, especially the grounds named The Shrubbery, in which the tents were pitched. The attendance of visitors was encouraging, and none but the more genteel element were noted. The band of the School of Gunnery, from Shoeburyness, supplied the music. After judging was completed, the promoters, with the exhibitors and others, met together at luncheon, but of the proceedings there we are unable to speak, as we had not the pleasure of participating in that function. The hon. secretary was the Rev. F. R. Burnside, Great Stambidge Rectory, Rochford.

#### Nurserymen.

Two capital boxes, containing forty-eight blooms, in Class 1 were staged by Messrs. B. R. Cant and Sons, Colchester, there being only a few flowers that one could criticise, and even then the lower petals alone were at fault. They staged perfect blooms of Ulrich Brunner, Horace Vernet, Duke of Edinburgh, Général Jacqueminot, Ulster, Carl Druschki, Reynolds Hole, Madame Cusin, Comte de Raimbaud, Marie Verdier, A. K. Williams (very rich), Suzanne Marie Rodocanachi of brilliant colour, and a splendid flower of Xavier Olibo. The reds were particularly handsome, being all so deeply coloured and every bloom so clean. The set certainly drew forth considerable admiration. The second prize collection was from Messrs. R. Harkness and Co., Hitchin, and, though lacking in size, they were all clean flowers of good size and form. Gustave Piganeau, at the top left-hand corner, was an ideal flower; Bessie Brown and Horace Vernet were each of great merit, and Liberty was shown to perfection. When seen at its best this flower is splendid. Does not Ulster run Mrs. W. J. Grant very close in colour and general character? It is difficult to tell them at times. Grand Mogul was another giant in one of the boxes. Messrs. D. Prior and Son were third, with blooms that would have won at many shows, but which were scarcely fresh enough for Southend. Their Liberty, Horace Vernet, and Victor Hugo and a Princee Camille de Rohan were each show Roses. Five competitors entered.

For eighteen trebles the Harkness firm were here to the fore with brilliantly coloured blooms, but which had suffered from wind and weather. Mrs. J. Laing, Bessie Brown, and Alfred Colomb were each good. Second came Messrs. D. Prior and Son, with splendid Horace Vernets; and third out of five came Messrs. B. R. Cant and Sons with small flowers.

#### TEAS AND NOISETTES.

These were by no means so fine as the flowers in the two foregoing classes. Messrs. D. Prior and Son, Colchester, led with a fair collection of eighteen in Class 7, the freshest being Maréchal Niel, Maman Cochet, Niphotos, and The Bride. There were four collections, and Messrs. F. Cant and Co. followed next with a dark red Madame Cusin, good Bridesmaid, and Ethel Brownlow. Third, Messrs. B. R. Cant and Sons.

Only three firms contested in Class 8 for a dozen Teas in trebles, the Priors, of Colchester, again leading the way. Their flowers here were much cleaner, and on the whole more even. Messrs. F. Cant and Co. formed a good second, and third Messrs. B. R. Cant and Co. The blooms in each set were not of the best form.

#### GARDEN OR DECORATIVE ROSES.

Messrs. Paul and Son, of Cheshunt, led the way against Messrs. F. Cant and Co. and B. R. Cant and Sons (in this order) for twelve bunches of garden Roses, the Cheshunt firm staging very large and imposing bunches, as is their usual practice. Their bunch of H.T. Lady Battersea, for instance, comprised over fifty well-developed flowers and buds. Amongst others shown were Madame Jules Grolez, Alistair Stella Gray, Crimson Rambler, Camoens, Liberty, Madame Pernet Ducher, Marquis de Salisbury, Madame Ravary, W. Allen Richardson, Killarney (rather weak), and the beautiful semi-double H.T. Dawn.

#### Amateurs and Gardeners.

Classes 3 to 6 and 9 to 11 were reserved for amateurs and gardeners, and when the names of the prizewinners, as given hereafter, are scanned the high merit of the collections will be taken for granted. Thus, for instance, we find the redoubtable Mr. E. B. Lindsell, Bearton, Hitchin, leading for two dozen singles with an even lot, comprising Duke of Wellington, almost perfect in form and finish, and winning the N.R.S. silver medal for the best H.P. Alfred Colomb and Horace Vernet were each

charming, but all the light-coloured Roses were below par. Mr. O. G. Orpen must have closely followed his successful antagonist, and his set were really good. Killarney was here ideal, and fine representative blooms of Bessie Brown, Mrs. John Laing, and S. M. Rodocanachi were also included; while Mr. R. Foley Hobbs, Worcester, though distinctly behind his leaders, still showed strongly. Bessie Brown showed up well, and so did Mrs. J. Laing. Seven entrants contested for honours, the aggregate of blooms here being 168.

Mr. Lindsell was again foremost for a dozen varieties in threes, and the blooms were all large and of superior merit. Mr. Foley Hobbs came second and Rev. J. H. Pemberton, Romford, followed as a close third, there being little to choose amongst the three.

For twelve Roses, distinct, Mr. O. G. Orpen beat Mr. E. M. Bethune, Horsham, and third Miss Beatrice Langton, Hendon, there being six collections. In Class 6, for half a dozen flowers, Mr. G. H. Baxter, Hutton Park, Brentwood, took the lead, Mr. Herbert E. Molyneux, of Balham, coming second.

#### TEAS AND NOISETTES.

Competition was again keen in Class 9, for the dozen distinct Teas and Noisettes, the premier honours falling to that king of the amateur Tea growers, Mr. O. G. Orpen, with the best set in the exhibition. He included Maman Cochet, Muriel Grahame, Mrs. Edward Mawley, White Maman Cochet, Medea, Catherine Mermet, Comtesse de Nadaillac, Souv. de S. A. Prince, Ernest Metz, Innocente Pirola, Madame Cusin, and The Bride. The Horsham grower, Mr. Bethune, made a capital second, and third Mr. Lindsell. Mr. Hobbs beat Mr. Baxter for the half-dozen Teas, and in Class 11, for the same number of varieties in trebles, Mr. E. M. Bethune led with good blooms, beating Mr. O. G. Orpen, who had Mrs. Mawley in fine form; and third, Rev. F. R. Burnside, Great Stambidge Rectory. The blooms were all superior.

#### DECORATIVE ROSES.

For twelve bunches of decorative Roses Mr. Pemberton just managed to lead against Mr. Orpen, and third came Miss B. Langton. The best vases were those of H.T. Gustave Regis, H.T. Liberty, R. macrantha, R. multiflora grandiflora, Lady Penzance, H.S.B., R. mosehata, and the old Red Provence.

#### Open Classes.

For twelve blooms of any dark Rose first came B. R. Cant and Sons with A. K. Williams, and second R. Harkness and Co. with Fisher Holmes, Messrs. F. Cant third with the same variety. For a dozen light Roses Mr. Orpen led with perfect blooms of White Maman Cochet, the best bloom here securing the N.R.S. silver medal for Teas, and, indeed, this was a perfect Rose. Messrs. F. Cant came second with Bessie Brown (fair); and third, Mrs. J. T. Thompson, The Laurels, Bounds Green, N., with Mrs. J. Laing. Messrs. Prior alone entered in Class 14, for a dozen of a yellow Rose, staging Maréchal Niel; but five competed in the next class, for a dozen trusses of any Tea or Noisette, Mr. Lindsell winning with a selected twelve of Madame Cusin, of grand form, deep colour and substance, but marked here and there on the lower petals. With Maman Cochet Mr. Bethune was a strong second, and Mr. Orpen third with White Maman Cochet, lacking in size.

#### Local Classes.

The local classes were all but a failure.

#### Miscellaneous.

Mr. William G. Hatch, Cromwell Road Nursery, Prittwell, staged Sweet Peas in variety, but too crowdedly and without much taste. Messrs. F. Cant and Co. had an exhibit of their new Gold Medal Tea Rose Lady Roberts.

### National Sweet Pea, July 15th and 16th.

Rosarians debate on the advisability, or the opposite, of holding a two-days Rose show, and yet the Rose lasts equally as well as the Sweet Pea; and we find the N.S.P. Society extend their exhibition to two days. In the case of the baskets and other floral designs done in this flower, the result is very pitiful about mid-afternoon on the first day, but otherwise the exhibits remain passably fresh. Held within the Royal Aquarium at Westminster, on Tuesday and Wednesday last, the show was in every way a great success. The flowers were good on the whole, and particularly so in Classes 7 and 8. A number of seedlings and novelties were noted here and there, particularly bright being Burpee's New Countess, lighter than either Countess of Radnor or Lady Grévil Hamilton. Countess Spenser, which received a certificate last year, was shown splendidly by Mr. Silas Cole; it is one of the finest half-dozen Sweet Peas.

Much regret was expressed at the unavoidable absence of Mr. Henry Eckford, who had intended to fill a whole table, but had had to wire from Wem on the Monday to cancel his entry. A

local storm may have dealt destruction to the fine collection at Wem, and if that were so we heartily sympathise with the firm in their unfortunate position. At the luncheon one of the speakers drew attention to the confusion of names already observable. In the interests of the trade as a whole, this matter should at once be checked.

#### Open to All.

The leading class in the open section enticed four competitors to test their skill as growers and exhibitors, and so good was the general mass that perhaps a more central position might have advantageously been furnished for the long table. The leading place was captured by Mr. W. Simpson, gardener to R. C. Forster, Esq., J.P., The Grange, Sutton, who staged his brown coloured vases upon wood blocks. These were of three sizes, those at the back being about 1ft high, and the second set 6in; the front row were less still. We still persist in thinking glasses would enhance the beauty of such displays. Mr. Simpson's flowers were of good quality all through, the number of sprays in each vase being limited by the rules of the schedule to one score. The admixture of colour was wonderfully effective, and certainly to secure good contrasts or harmonies is an art in itself, and demands considerable exercise of judgment. In the back row he staged Salopian, Hon. Mrs. E. Kenyon, Black Knight, Triumph, Mrs. Sankey, Countess of Radnor, Chancellor, Lady Ormsby Gore, Monarch (very good), Royal Rose, Blanche Burpee, and Lord Rosebery. Second row: Lady G. Hamilton, Lottie Hutchins (good colour), Mars, Prima Donna, Emily Eckford, Queen Victoria (very sweet), Miss Willmott (one of the best), Princess of Wales, Prince of Wales, Lady Nina Balfour, Captain of the Blues, and Aurora. Front row: Prince Edward of York, Hon. F. Bouverie, Gaiety, Sadie Burpee (rather poor), Miss Dugdale, Senator, Lovely, Lady Mary Currie (runs Miss Willmott), Dorothy Tennant, Emily Henderson, Lottie Eckford, and the brilliant Gorgeous. Jones and Sons followed second, but theirs lost the rich effect of Simpson's; and third, Mr. L. Brown.

The second class to us was unattractive, for there was a great lack of that exquisite grace which Sweet Peas can present when arranged in glasses lightly and loosely over a white cloth or white paper. Messrs. Isaac House and Son, Westbury-on-Trym, Bristol, were placed first, and their flowers, with an accompanying abundance of foliage and stem, were good in themselves, being deeply coloured, large in size, and of fine substance. Yet surely the "mist" of Gypsophila was too heavy? Their best bunches were Lord Rosebery, mauve-cerise; Golden Rose, a washy colour; Miss Willmott, bright scarlet cerise; Gracie Greenwood, salmon pink; and Burpee's New Countess, after Countess of Radnor type and colour. Geo. Gordon is another distinctive flower. Messrs. Jones and Sons, Shrewsbury, with a very poorly staged collection, followed second, having Miss Willmott, America, Emily Eckford, Mars (not unlike Geo. Gordon), and the lovely salmon red Countess of Powis as their best. Little Dorritt, with standards too much notched, was nevertheless very pleasing, and Lovely indeed well deserved its name. The succeeding award fell to Mr. L. Brown, Brentwood.

The dozen distinct bunches succeeding the foregoing class brought four entrants, and Messrs. Jones' efforts, which gave them the leading place, was infinitely to be preferred to the dull and sparse disposal of the flowers in Class 2. The bunches here were large and spread out in a loose and free manner, with a minimum of foliage, and glasses were used in place of dark earthenware vases. The selection is worth naming, which we do as follows: Prince of Wales, Jeannie Gordon, Hon. Mrs. E. Kenyon, Black Knight, New Countess (very telling), Miss Willmott, White Seedling (large and meritorious), Mars, Duke of Westminster, Venus, Puck Friar, Baden-Powell (the deep violet blue), and Duke of Westminster. The second place was accorded to Messrs. I. House and Son, whose flowers were good, but the superabundance of greenery destroyed their fullest effect. Coccinea they staged in splendid style, and when seen at its best this is a handsome flower. The New Countess is seen to be a bright lavender, and one of the most graceful of the quieter coloured Peas. Gracie Greenwood was here again most pleasing, and very sweet indeed. It is one of the best exhibition Sweet Peas. Third in the lists came Mr. Chas. W. Breadmore, seedsman, 120, High Street, Winchester, and a showy set he had. His Miss Willmott was better coloured than any we saw, and it would be interesting to learn the kind of soil and the amount of sunshine Mr. Breadmore's plants enjoy. Lord Rosebery is large and rich, and so was Duke of Westminster, which shone in purple and violet. He was weak in really good light Peas, and larger bunches and better staging would have helped him forward.

#### Trade Excluded.

The fourth and fifth classes between them drew nine competitors, the aggregate of bunches being 264. For thirty-six distinct sorts in bunches, Mr. F. J. Clark, Wistow Hall, Leicester, was first; Mr. F. Ackland, Hapsford House, Frome, second; and third, Mr. C. Osman, South Metropolitan District School, Sutton. A fourth went to Mr. T. Leith, Basingstoke.

For two dozen bunches, the Rev. L. Knight Smith, Brighstone, Isle of Wight, beat Mr. F. J. Clark; third, Mr. T. Stanton,

Sion Hill Place, Bath; and fourth, Mr. J. G. Ward, High Street, Brentwood.

Twelve bunches distinct (class 6), first, Mr. Silas Cole; second, Mr. G. Hughes, of Kingston; and third, Mr. Aubrey Hooten, College Road, Epsom, there being fourteen entries, and nearly all of them highly superior. For nine ditto, Mr. H. A. Needs led the way; second, Mr. E. Beck, Sherborne House, Hoddesden; and third, Mr. S. Cole. The latter also led for the half dozen, followed by Rev. L. Knight Smith and H. A. Needs, out of thirteen in this order.

#### Twos, in Distinct Colours.

The succeeding classes were for two bunches, each in distinct colours. We give the first prize winners only. Class 9, two of white, six entries, House and Son, with Sadie Burpee, and a white seedling. Scarlet or crimson, Mr. C. W. Breadmore, with Mars and Salopian. Yellow or buff, House and Son, with Hon. E. Kenyon and Lady Ormsby Gore. Pink, Mr. Silas Cole, with Prima Donna and Countess of Spencer. Rose, House and Son, with Lord Rosebery and Jeannie Gordon. Mauve, House and Son, with Burpee's New Countess and Lady Grisel Hamilton. Blue, Mr. J. Watson, jun., Orford House, Ham Common, with Emily Eckford and Captain of the Blues. Striped, Mr. F. Brewer, of Bickley, with America and Princess of Wales.

A class was provided for Cupid Sweet Peas in pots, but "Cupid" was not at home; no entries.

#### Floral Decorations.

Seven joined in Class 18 for the decoration of a dinner table (6ft by 3ft). The majority were pleasing, but nearly all were overcrowded. Mr. H. A. Needs led, and Mr. F. H. Barnes, Hornchurch, Essex, was second. In Class 19 for the same, open to all, Mr. D. B. Crane, of Highgate, was first; and second, Jones and Son, Shrewsbury. In the next two classes the latter were first, viz., for an epergne and a basket, eight competing in both cases. Miss C. B. Cole, of Feltham, won for a bouquet of Sweet Peas out of nine; and Mr. Leonard Brown, Brentwood, was first in Class 23 with a cross. For three buttonholes Mr. C. W. Breadmore beat his six rivals. Four entered for two vases of Everlasting Peas, Miss F. Harwood, of Colchester, beating Mr. R. Dean.

#### Non-Competitive.

We cannot describe all the trade exhibits. Sweet Peas do not vary so very much, and the same varieties are found in all the stands.

Messrs. Dobbies and Co., Rothesay, N.B., had the largest group, which was excellently arranged. Mr. Jones, of Lewisham, and Hobbies, Limited, arranged theirs at the west end of the hall, under the organ, both being imposing features. Jones and Son, of Shrewsbury, were forward, and so were Isaac House and Son, E. W. King and Co., Geo. Stark and Son, Great Ryburgh; J. Peed and Son (with hardy flowers as well); and J. Williams, of Ealing.

#### Medals.

The following awards were accorded to non-competitive exhibits. Messrs. Dobbie and Co., Rothesay, large Gold Medal; Gold medals to H. J. Jones, Ryecroft, Lewisham, S.E.; Hobbies, Limited, and Jones and Sons, Shrewsbury. Silver Medals to King and Co., Coggeshall; I. House and Son, Bristol; G. Stark and Son, Great Ryburgh; J. Peed and Son, Norwood; and J. Williams, Ealing. Mr. Towell received a commendation.

#### R.H.S., Scientific Committee, July 8th.

Present: Dr. M. T. Masters (in the chair); Messrs. Druery, Hooper, Saunders, Worsdell, and Elwes; Drs. Rendle and Müller, Prof. Boulger, Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.

*Beech Trees with Phyllaphis.*—Mr. Saunders reported as follows upon the communication received from Mr. White: "The insect is *Phyllaphis fagi*, which infests the lower branches more than the upper. They feed on the under side of the leaves, and the honeydew which they deposit falls on the leaves below. The pest may be destroyed on a small tree by spraying the under sides of the leaves with paraffin emulsion."

*Clubbing and Gas Lime.*—Mr. Wilks described his experience with gas lime as a remedy, without success. Three inches in depth were dug in last November. Cabbages were planted in March, and grew well at first, but proved to be very badly affected. Mr. Saunders undertook to examine the roots.

*Athyrium attacked by Grubs.*—Mr. Druery exhibited specimens attacked by some maggot, which ate the interior of the rachis. Mr. Saunders undertook to examine them.

*Digitalis malformed.*—Mr. Holmes exhibited a spike in which the corollas were split and the segments antheriferous. A similar monstrosity was described by Rev. G. Henslow in "Journ. Lin. Soc." vol. xix., p. 216.

*Pear diseased.*—Mr. Hooper showed specimens of Pears, apparently attacked by some fly, with leaves blistered by the *Phytoptus pyri*. Mr. Saunders reports that they are attacked by the grubs of the Pear

Midge, *Diprosis pyrivora*. It lays its eggs among the stamens, and the grub feeds on the young fruit. The chrysalis is found about an inch below the ground. 1½ in. of soil should be pared off and burnt, or the surface soil may be buried 5 in. deep.

*Crinum* sp.—Mr. Elwes exhibited an umbel of very fine flowers, which have the perianth white, with a median crimson stripe. It came from Brazil, and it appears that Mr. Goodman found it also in Jamaica. He suggested that it might be *C. Kirkei* from Zanzibar. Mr. Elwes remarked upon the wide diffusion of several African bulb plants in the last century.

*Iris malformed*.—Mr. C. T. B. Crews, of Wokingham, sent a specimen with double flowers. Dr. Masters undertook to examine it.

*Leucadendron malformed*.—Mr. Henslow showed an inflorescence in which, instead of flowers, the peduncles were covered with bracts like the "wheat-ear" Carnation. It was from a bush growing on the flanks of Table Mountain.

*Apple-leaf Blister*.—In reply to Mr. H. F. Gettling's inquiry, Dr. M. C. Cooke observes that this is as great a mystery as ever, as there is no trace of fungus. There are abnormal tufts of hairs, probably induced by minute insects. Further observations on *Erineum pyrinum*, a possible cause, will appear in the "Journ. Hort. Soc."

*Stameniferous Fig*.—Mr. Henslow called attention to the variety Pingo de Mel, from Portugal, which is an exception to the rule that nearly all edible Figs are female, while this bears stamens, though without pollen. The female flowers had globular ovaries (gall-flowers), so that it appeared to be an edible variety of the *Caprificus*, or wild Fig, which is always infested by the minute wasp, *Blastophaga grossorum*.

*Sycamore Fig*.—Mr. Henslow showed specimens of this Fig which is always infested with *Sycophaga crassipes*. To remove them, the Fig is cut open by a peculiar hook-shaped instrument; the process also causes the Fig to acquire great sweetness. The Figs are only cut open and eaten by the poorer classes in Egypt, but the process is the same now as described by Theophrastus in the 5th century B.C. Three forms of Fig-cutters were shown.

*Apples diseased*.—Mr. Saunders observed on some small Apples shown, that they had been attacked by some insect, probably the Apple sawfly, *Hoplocampa testudinea*. When mature, the grubs bury themselves, so that not only should all the little Apples that fall naturally or when the tree is well shaken, be burnt, but the surface soil should be burnt or buried deeply. The soil should be dressed with kainit (½ lb. per square yard) between the middle and end of June, just before or after rain. If very dry, the dressing should be watered.

## The Cucumber Supply.

Attention to routine operations is important for the continued bearing of the plants. The growths should be thinned as occasion requires, looking the plants over twice a week, it being easy to rub off a starting shoot in the wrong place, or one for which there is no room, and the points of unruly growths may be nipped off without prejudice. It is different when the manipulations are distant, then the amount of trimming is considerable, the wounds are correspondingly large, and the foliage impaired by the previous crowding and afterwards sudden exposure. This is how Cucumbers are weakened and less able to contend with their enemies.

Remove exhausted growths to make room for young bearing shoots. Keep the shoots well stopped to one joint beyond the fruit, or at the fruit if the plants are vigorous and showing no signs of exhaustion. Always allow weakly plants more extension, and crop them lightly. Remove bad leaves as they appear, always having an eye to the first speck of abnormality on the foliage, whether caused by red spider, thrips, white fly, or mildew. These pests have an abhorrence of sulphur, especially the fumes which are given off more or less under the solar heat acting on surfaces more or less coated with the flowers of sulphur. Mildew spores are just now very abundant in the atmosphere, many wild plants being quite white with the over-spreading mycelium, erect hyphæ, and shed conidia. Have an eye, therefore, to Cucumber plants, preferably dusting a little sulphur on the plants, or where the sun can act on it, as a precautionary measure. Maintain a steady root action by top-dressings of fresh compost from time to time, and sprinkle on a little fertiliser occasionally. Secure a top heat of 65deg to 70deg at night, 70deg to 75deg by day, 80deg to 85deg in the sun, closing early to increase to 90deg, 95deg, or 100deg. Syringe in the afternoon of hot days, avoiding late syringing, for the foliage should be dry before sunset so as not to be unduly prejudiced by incumbent water. Commence ventilating, it being important that the foliage be dry before the sun acts powerfully upon it. Shade over to prevent scorching and flagging. The

plants for autumn fruiting should now, or soon be, placed on hillocks or ridges moderately firm, maintaining a moist, genial atmosphere, and they will soon grow sturdily and show fruit abundantly.

I would now allude to a parasitic fungus, *Cercospora melonis*, which riddles the leaves into holes and destroys them, also infesting the foliage of Melons. It is not by any means new, but has only recently been certified as a determinate parasite on Cucurbitaceous plants. It produces or causes dry brownish spots to appear on the leaves and often on the petioles and stems. The spots or blotches are of irregular form, often running together and involving the whole leaf. It is most abundant in damp weather, and on structures kept very close and moist, and spreads with astounding rapidity. Spraying with a solution of permanganate of potassium, 1oz of the crystals to 3 gallons of water, arrests the disease, not only treating the plant but also the soil. The solution, however, discolours white paint, still the parasite must be combated. Probably the disease is accelerated by the moist and close conditions under which Cucumbers are grown, for where plenty of air is admitted the parasite makes little progress.—G. A.

## February Savoys.

In the garden Savoys are considered an important autumn and winter crop, and justly so; for when the summer vegetables are over, and cold takes the place of solar warmth, something of a hardy nature is at once called into use to take up the succession. Their employment is not justified so long as other autumn vegetables are holding out; indeed, a common expression is that Savoys are not in condition until they have been seasoned with frost. It is thus clear that weather influence, at one stroke as it were, switch one section off and the other—the winter one—on. While there is a natural pride and satisfaction in the maturity of a good breadth of this winter vegetable by the time frosty nights become the rule, there does not seem the same keenness in providing for the later months of the winter. True, Savoys become tiring to the palate after a use of three or four months, but Savoys are, I find, particularly useful in February, when they are available, and this is specially true should there have been severe weather up to that time. Savoys which have become full-hearted by the end of October will not long endure bad weather without decay. With much rain, too, they burst badly, which expose them to untoward weather not without ill consequence.

A succession of Savoys for three or four months imply a necessity of sowing at intervals during May and early June. Many sow in April, some even in March; but there is no necessity of so early a start, because there is often no space for planting them in private gardens when raised thus early, and no demand for them when ready at an early period of the winter. The June sowing is that which is most likely to provide for February, and if they have a value at that time they should receive some encouragement in their advance from the seed bed, and an open site where they may grow sturdily and hardy. From this late sowing they may appear disappointing when compared with the early winter stock, but it is somewhat remarkable how apparently unsatisfactory plants in November develop by February, given normal treatment and wintry weather. I have often chafed when these have passed under review in late autumn, fearing that their edible qualities will not satisfy later; but almost invariably this passes off, and an element of satisfaction takes its place when earlier beds are cleared off and there yet remain material for daily use.

While the full-hearted Savoy succumb to severe frost or heavy rains, these unmaturing plants progress unscathed, a point that it is well to bear in mind both at sowing and planting times. I have often seen Savoys being planted when my seed yet remained unsealed in the packet, but I have not found that the early "racers" served a better purpose or supplied more useful material in bulk or quality than when less time is meted out to them. When severely stunted in the seed bed awaiting an opportunity for planting they are a long time in making a start. With this procrastination in evidence the younger unstarved plantling gets a footing and is soon well on the road, keeping pace or even superseding its older companion in the race for time.

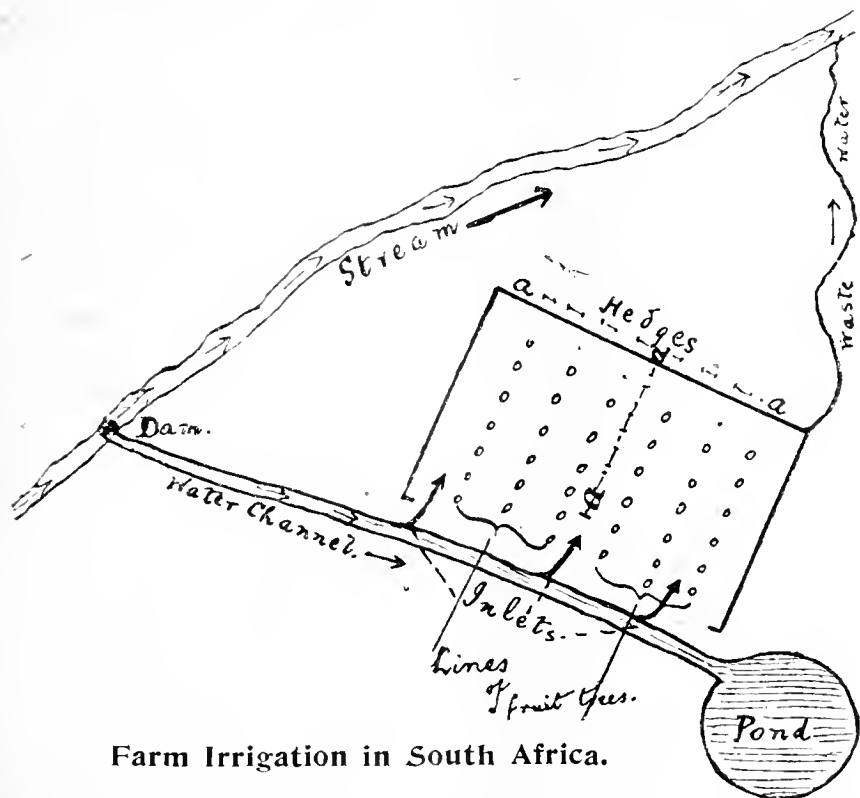

A variety I have found reliable for late cutting is Sutton's New Year. It is reliable because hardy, and is accommodating because late planting is made a necessary condition. Pressure of space often keeps strong plants in the seed bed doing themselves more harm than good, to say nothing of the great labour involved in their planting. As ground is cleared of successive summer crops it becomes available for these late winter ones.—W. S.

## Notes from the Transvaal.

The following letter from a soldier, we feel sure will be read with much interest:—

"I received your letter dated May 18. By the time you receive this, I hope we will have orders for home. The burghers are coming in all right, and one of Kemp's commando was telling me that there would be close on 20,000 when they all came in, which time will tell. Most of them are very hard up for clothes and boots. I was speaking to some of Delaray's mob, and they all give Methuen a very good name, and say his capture was a piece of misfortune. One old man gave us cigars and said he would fight for Britain any time after this. They all seem to be glad the war is over. One said that they get on best with Scotchmen—as Scotchmen pick up the Dutch (or rather Taal) language very quickly.

"The way the old Boer farmers do with the Kaffirs is to allow the latter so much land to grow whatever they like in return for their labour on the farm. Most of the farmers are content with growing a few mealies (Indian Corn) and Pumpkins, and sometimes Tobacco. Most of them build their farms near some stream or spring, and generally build a big dam to throw the water into the channels made for irrigation purposes. Very few have windlasses, as they are expensive and the Boers are not a progressive lot. Most of the houses have draw-wells next to

Farm Irrigation in South Africa.

them, and the farmers don't seem to have to sink them far to get water. I see our Government had a lot of experts out here to report on the best methods of irrigation.

"About six months ago I saw in the 'Bloemfontein Post' a prospectus of a company being formed to pump water from the Orange River to the Karoo desert in Cape Colony for vineyards, &c. I prefer either Natal or the Transvaal to Orange River Colony or Cape Colony for anything either in farming or other industry. In the Western Transvaal are found splendid agricultural districts, especially round by Rustenburg. Near by Pretoria the districts are rich in minerals, and this continues so right up to Middelburg. In the 'New Scotland' district round by Botheville and Steynsdorp in E. Transvaal we passed a number of splendid farms, mostly owned by Scotchmen. Most of the soil seems to be very sandy in all parts of the country.

"The great drawback, according to my idea on farms out here, is the scarcity of good grazing during the winter. The grass gets burned and withered, and has no substance whatever, and affects stock greatly. Cattle grow to an enormous size, however, and with nothing but the simple grazing to fatten them. I have seen some draught oxen which I am sure would weigh nearly 16cwt or 18cwt. Of course I may be mistaken, but I think an average bullock at home is about 10cwt or 11cwt, and I was judging by appearances. Farmers out here have to spend considerable sums on fencing, and a great many use slabs of stone instead of wooden posts. Others plant rows of trees, as ants leave growing trees alone. Round gardens or orchards they generally make hedges of Prickly Pears (*Opuntia vulgaris*) or Quince bushes. The most general wage out here for mine employes, tradesmen, &c., is £1 a day. Prices for lodgings vary, but in Johannesburg and Pretoria they are much the same, and generally range from 30s. a week upwards. A suit of clothes costs about £6 or £7. One is a great deal better off at home with 30s. or 35s. a week than with £1 a day out here. With these few notes in the meantime I conclude.—W. D., Pretoria, Transvaal, South Africa. June 15, 1902."

## Fruit Forcing.

**PEACHES AND NECTARINES: EARLY FORCED HOUSES.**—Trees of Alexander, Waterloo, and Early Louise Peaches, Advance, Cardinal, and Early Rivers Nectarines, will now, or by the end of the month, have the buds sufficiently plumped and the wood matured to admit the roof lights being removed. This is a commendable practice, as it prevents over-maturity in the buds, lessens the danger of their dropping, and the trees are cleansed and refreshed by the dews and rains in the autumn. Where the lights are not moveable air should be admitted constantly to the fullest extent, the border properly watered, and the trees syringed occasionally, so as to keep the foliage free from red spider. The second early varieties, such as Hale's Early, A Bee, Early Alfred, and Dr. Hogg Peaches, Lord Napier, Darwin, and Rivers' White Nectarines, which were started at the new year, will not be so forward, and the mid-season varieties, Stirling Castle, Royal George, Dymond, Noblesse, Grosse Mignonne, and Bellegarde Peaches, with Stanwick Elruge, Humboldt, and Dryden Nectarines, will be later still, but all cleared of their fruit. Wood in which the fruit was borne will have been removed, reserving extensions; all superfluous growths have also been cut away, so that the trees have the full benefit of light and air by the foliage being fully exposed, influences essential to forming and perfecting the blossom buds and the thorough maturation of the wood. Syringe the trees and cleanse them of insects if necessary by the prompt application of an insecticide, and supply water, or in case of weakly trees, top-dressings of artificial fertilisers washed in, or liquid manure at the roots. Mulching will also tend to keep the roots active at the surface and prevent the premature ripening of the foliage. Admit air to the fullest extent. When buds are plumped and the wood hard and brown where exposed to the sun, the roof lights may advantageously be removed.

**SUCCESSION HOUSES.**—Trees started in February and being of the approved standard second early and midseason varieties, which are much better than the very early sorts for general cultivation, have the fruit ripe and ripening. As the sun acts fiercely on the apex of the fruit it often ripens or even shrivels these before the lower part becomes soft. To obviate a slight shade from powerful sun is an advantage, preventing the defect mentioned and insuring more even ripening. As the fruit is cleared off the trees, cut out the wood that has borne fruit and then the growths where too close, or where the foliage cannot have the essential exposure to atmospheric influences. Cleanse the trees of dust and red spider or insect pests by means of the syringe or engine, if necessary using an insecticide. Keep the border thoroughly moist, feeding trees that have carried heavy crops or are at all weakly. Avoid, however, making the soil sodden by thick and heavy applications of liquid manure, or inducing growth by too abundant top-dressings of the advertised fertilisers. Stop laterals to one joint, or allow a little extension if the trees are weakly or have the buds in an advanced state, thus preventing the foliage ripening prematurely by continuing the root action with growth. When the buds are well formed the roof lights may be removed in showery weather, and where this cannot be done the fullest amount of air should be given. The exposure to rains and dews has an invigorating effect, doing no harm except where the trees are too vigorous and the wood ripening unkindly.

**HOUSES WITH FRUIT SWELLING.**—Trees started in March have the fruits in a forward condition where they have stoned satisfactorily, as they do when the growth is not too luxuriant or improperly formed and matured. The leaves overhanging the fruit should be drawn aside, and depending specimens raised by means of laths placed across the trellis wires so that the apex will be to the light. Water the borders copiously as required, and feed with liquid manure or top-dressings of the advertised fertilisers washed in. Keep the surface mulched with short, sweetened, or spent manure in a lumpy state, just a little to keep the surface uniformly moist and encourage surface roots. Avoid a thick mulch of material likely to form a close soapy mass and exclude air. Ventilate early; in fact leave a little air on constantly, syringing by 7 a.m., and through the early part of the day ventilate freely. When the sun commences to lose power in the afternoon reduce the ventilation, and raise the temperature to 85deg or 90deg by its agency about 4 p.m., with a good syringing and damping, but it must be done with judgment, for when the water hangs for any length of time on the fruit during the last swelling process it is liable to damage the skin, causing it to crack, and giving the fruit a

musty flavour; therefore have the fruit dry before nightfall, and when the day is likely to be dull omit the morning syringing. Directly the fruit commences ripening cease syringing, but afford air moisture by damping the paths and borders in the morning and afternoon, ventilating rather freely in the daytime, and sufficiently at night to insure a circulation of air.

**LATE HOUSES.**—In order to assist the swelling of the fruit observe the conditions advised in the preceding paragraph. If wanted to accelerate the ripening ventilate rather freely in the early part of the day and up to 1 p.m., then keep the heat obtained by reducing the ventilation so as to secure 80deg to 85deg, and at about 4 p.m. close the house, syringing well, and no harm will come if the temperature rise to 90deg, ventilating about 6 p.m., so as to let the pent-up moisture escape and the temperature gradually cool down. Keep the shoots tied down as they advance, allowing no more than are necessary for next year's bearing or for furnishing the tree. Let all have space for development, with full exposure of the foliage to light and air. Keep laterals stopped to one leaf, also retain growth to attract the sap to the fruit. If there are any gross shoots which push laterals from the leaf buds, cut them back to where the buds remain intact, or if likely to derange the equilibrium of the tree and the equalisation of the sap, cut them off altogether, as they only tend to promote gumming, imperfect setting, and certain casting of the fruit in stoning. Draw the leaves aside or away from the fruit, and let it have as much light as possible, the sun acting directly on the apex. This will be uppermost when the fruit is put up for sale or dislied, hence the necessity of having the chief colouring there, and as the colouring is so is the flavour in the case of Peaches and Nectarines.

**UNHEATED HOUSES OR WALL CASES.**—Where there are early varieties in these structures, such as Alexander, Waterloo, Early Louise, and Early Rivers Peaches, Cardinal and Advance Nectarines, the fruits will be ripening. These should not be syringed, but the trees must not lack water at the roots, and the borders should be damped, as moisture is necessary for the health of the foliage. Afford top-dressings of the advertised fertilisers washed in, or supply liquid manure from tanks properly diluted, adding about 4oz of superphosphate to each gallon of strong liquid and diluting this with five or six times the bulk of water. House sewage may be used for this purpose, and its unpleasant smell may be subdued by using 1lb sulphate of iron to 10 gallons of undiluted sewage, this afterwards being diluted five or six times with water, mixing well a few days before use. This will convert the sewage into a more or less double sulphate of ammonia and iron, the latter being ammoniated, and then it loses any deleterious properties it might otherwise have in the large amount given. Iron is an essential plant food, but often worse than useless on the soil for lack of nitrogenous matter for ammoniation. Even without the direct application of the sulphate the sewage causes the foliage to assume a dark glossy hue, and this—the amount of chlorophyll in the leaves—practically determines the colour (when properly exposed to the light) and quality of the fruit. Keep the growths thin, every shoot having space for development and proper exposure to light and air. Syringe about 7 a.m., the house having a little air constantly; increase the ventilation with the advancing temperature, contriving to have it full at 75deg, or if it is desired to accelerate the ripening keep through the day at 80deg to 85deg, but always with ventilation, and close early to maintain the temperature, but not to raise it above 90deg. Syringe again in the afternoon about 5 p.m. This attended to, and the operation being effective, there will not be any red spider, the roots being well supplied with water and nourishment. Timely thinning increases the size of the fruits retained, and having been attended to early the fruit is a good size by the time the stoning is completed, when the final thinning should be given. It is a mistake, however, to leave many more for stoning than will be ultimately allowed to ripen, for it is really the stoning that is the exhausting process.—**ST. ALBANS.**

### Kitchen Garden.

**BROCCOLI.**—Early mid-season and late Broccoli plants ought all to be planted in the course of the present month, dealing first with those varieties intended to come into use in late autumn and early winter. Broccoli likes stiff, firm, but good ground, as in such soil the most desirable growth is made which is able to withstand the rigours of any untoward weather which may occur. Such plants produce thick substantial leaves, which are able to fold well over the centres and enclose the flower head as it develops. With such leaves and thick woody stems the plants are sure to be productive sooner or later. The best plants are those which have been gaining strength in nursery beds where they were pricked out previously for that purpose, but plants thinly grown in the seed beds are also suitable ground, for Broccoli ought to be selected in an open position. That which was liberally manured and dug in the spring, and is now firm, is the best, but any rich and fertile ground, however firm, can be utilised. Of course it is more difficult to insert the plants

where the ground is hard, but Broccoli does well even when inserted with a crowbar, watering the plants with liquid manure to afford them a start. Carefully pricked out plants are usually furnished with a mass of fibrous roots with soil adhering which it is desirable to retain; therefore, form a trench with a spade, place the plants at the proper distance therein, and make the soil as firm as possible about them. The distance between the rows should not be less than 2ft, and need not exceed 30in, the plants being 15in to 18in apart. Give surface cultivation by hoeing to keep down weeds and encourage growth.

**SAVOYS.**—A good breadth of Savoys ought to be planted forthwith, as upon the whole they are a most useful vegetable, supplementing and extending the supply for a long period. The small, compact varieties come into use early. The medium-sized and the larger sorts are invaluable during hard, severe weather, when other green vegetables may be scarce, while of course they are equally serviceable as a change during mild periods. Plant as good a selection as possible. The smaller varieties may be planted closer together than the larger. Some will do a foot apart in the rows, and that distance between the rows.

**CAULIFLOWERS.**—These and Cauliflower Broccoli, which come into use in autumn, must be encouraged with copious waterings of liquid manure. Remove yellow and decaying leaves.

**TOMATOES.**—Afford systematic and regular attention to Tomatoes growing against walls and fences. One or two main stems to each plant are ample, dispensing with the side growths, which appear in the axils of the leaves. Strong plants must be kept moist at the roots, and as roots of a fibrous character multiply, and bunches of fruit set and swell, the need for a mulching of manure will be apparent. In addition the plants must be assisted to support the increasing burden of fruit by applications of liquid manure, weak in character at first, but increasing in strength as the crop becomes heavier. Denuding the plants of foliage to a large extent is a mistake, until the foliage turns yellow and is useless. It is far better to encourage root action, and give ample support, then the crop will be satisfactory.

**CUCUMBERS IN FRAMES.**—With continued cropping and growth the plants become to a certain extent overcrowded and somewhat exhausted. It is a good plan, therefore, to go over the entire frame, cutting out the exhausted growths and yellow leaves, also any weakly growths, and regulate afresh. This will give an opportunity to top-dress with a mixture of good soil, having a dash of artificial manure in it. A fresh impetus to growth will thus be given, and the plants will produce fruit abundantly again, especially if the conditions which favour healthy growth are maintained, namely, a moist atmosphere.—**EAST KENT.**

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

| Date.        | Direction of Wind. | Temperature of the Air. |           |           |           | Rain.       | Temperature of the Soil.<br>At 9 A.M. |                |                | Lowest Temperature on Grass. |

The first part of the week was very warm. Thunderstorms occurred on the 9th and 10th, since which time the weather has been dull and cool.

### Sweet Peas from Canterbury.

Mr. Geo. Mount, nurseryman, Canterbury, sends a consignment of Sweet Peas, from among the varieties of which we select the following:—Miss Willmott, bright salmon rose; Lovely, a beautiful shade of mauve-pink; Blanche Burpee, white; Black Knight, rich violet-maroon; Queen Victoria, pale tea coloured; Emily Eckford, violet-blue, and Prince of Wales, mauve-crimson. Each of these are very beautiful and distinctive.

\* \* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy—Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**HYDRANGEA "SPORT" (J. Blackburn).**—As you say, the plant is a very ornamental one for pot culture. It is a distinct variety of *Hydrangea hortensis*, and is named *variegata*.

**TOMATO LEAVES CURLING (E. D'Olier).**—The most probable cause of the leaves curling is too dry an atmosphere and an insufficient supply of water at the roots, but the old leaves usually curl more or less, and some plants are more given to it, as you note, than others. Mulch with short manure, supply water abundantly at the roots, and keep the house a little closer.

**ROSES FOR GREENHOUSE (H.).**—Your request implies that you need Roses for training up the roof, but you do not say so. For this purpose we doubt if any will give greater satisfaction than *Maréchal Niel* and *Gloire de Dijon*; the best red variety for the same purpose is probably *Reine Marie Henriette*. As a rule they are far better planted in good soil than kept in pots. Two good Roses for growing in pots for forming bushes are *La France* and *Niphetos*, of which strong plants well cultivated give a wonderful quantity of acceptable flowers.

**INSECT TO NAME (East Ham).**—It is the creature known by various popular names, such as *Reve Beetle*, on account of its wandering habits and quick movements; *Cocktail Beetle*, from its custom of elevating the abdomen when alarmed or angry; and *Devil's Coach-horse*, from its blackness and sinister appearance. Its proper name is *Ocypus olens*. It is a predacious beetle, and the larva is as predacious as the perfect beetle, and when food is scarce or the appetite keen has not the slightest hesitation in feeding on its own species. It is not injurious to vegetation, but a friend of the horticulturist, as it destroys some of his worst enemies, your having found it feeding on slug being much in its favour.

**USES OF WATER LILIES (J. H.).**—The leaves and stems of these plants and their relatives are generally stringent and bitter, the roots possessing these qualities very strongly developed. The rootstocks of *Nymphaea alba*, the common White Water Lily, contain a quantity of starch and mucilage, with tannin and a narcotic principle that is removed by washing, the roots being then used as food in some countries, particularly in Sweden. We do not, however, think the petals would be very beneficial for the purpose you name. The flowers of the yellow Water Lily, *Nymphaea lutea*, are said to possess a narcotic property, and in some parts of England they are called *Brandy Bottles*, from the resemblance of their odour to brandy. In Turkey a cooling drink is prepared from them.

**RASPBERRIES FOR AUTUMN BEARING (Anon.).**—October Red is the best, withstanding wet better than most others, Large Monthly being dwarf-growing and an abundant bearer, but the fruit is not so large as October Red or Belle de Fontenay. Orange d'Automne is very large, yellow or orange, and good in flavour; but October Yellow, though less in size of fruit, is more prolific. By double bearing we presume is meant the fruit borne sometimes on the canes of the current year's growth, which is usually most common when the season is moist and the canes make vigorous growth. These have been scarce with us this season, but have been usually sufficient to give a supply as an accompaniment for Red Currants in tarts and dessert until the autumn-bearing sorts continued the supply until the approach of winter.

**GORDIUS AQUATICUS (G. U.).**—The above is the name of the singular creature which children call horsehair worms, and we suppose many thousands of horse hairs have been placed in water by them under the erroneous notion that they be converted into the worms; hence the common name that is applied to them. They are found in many parts of Great Britain, but whether "all over" it or not we are unable to say. Their distribution, however, is general, not partial merely.

**SECOND CROP FIGS—PAULOWNIA IMPERIALIS (R. H.).**—It is not possible for you to preserve the Figs, which are now larger than Filberts, on a tree in the open air so that they will ripen next year. They will all shrivel and drop off whatever you may do to secure them. Nor is it practicable to protect the flower spikes of this tree so that the blooms will expand at this late season of the year. The nights are too cold for that to be accomplished, and such buds as you have sent will shortly fall. We are not able to state definitely the cause of the brown patches on the leaves. If you have not had a shower of hail in your district they have probably been caused by the puncture of an insect. The red Apple you have sent is *Fearn's Pippin*, the other *Keddlestone Pippin*.

**FRUIT FOR AUGUST AND SEPTEMBER (Constant Reader).**—If you have a warm position out of doors we should not plant Apricots in the house, but should add the *Moorpark* to those you name, and plant against a wall with south aspect in the open air. Some of the best Plums for exhibition are *Goliath*, also called *Emperor*, end of August; *Pond's Seedling*, end of September; *Kirke's*, middle of September; *Jefferson*, middle of September; *Transparent Gage*, beginning of September; *Huling's Superb*, end of August; *Denniston's Superb*, middle of August; and *Washington*, middle of September. The exact period of ripening depends on seasons and districts; we have given the usual times of ripening in the open air near London. It is for you to determine in accordance with the climatic character of your district whether you plant any of the trees under glass or not. You may graft the *Black Hamburg*, *Alicante*, *Gros Colman*, or *Madresfield Court* on the *Lady Downe's* stock provided it is healthy.

**ROSES FOR BUTTONHOLES (S. T.).**—Tea Roses are among the most suitable for this purpose, and there are few gardens where the soil is good and the atmosphere pure in which they, with a little protection, may not be grown. Free and good are *Niphetos*, *Madame Falcot*, *Homère*, *Madame Van Houtte*, *Madame Lambard*, *Safrano*, *Perle des Jardins*, *Comtesse Riza du Parc*, *Madame Jules Margottin*, and *Souvenir de Paul Neyron*. The old crimson *China Rose* and *Cramoisi Supérieure* are good for your purpose, as also are the *Noisettes Triomphe de Rennes* and *Aimée Vibert*, with *Baronne de Maynard*, *Boule de Neige*, and *Louise Darzens*. Moss Roses are indispensable—the common, crested, *Moss de Meux* and *Little Gem* (W. Paul), the latter being very charming. Among the most free and suitable of the Hybrid Perpetuals are *Jules Margottin*, *Général Jacqueminot*, and *La France*. We have probably named sufficient for your purpose. The advisability of digging-up and planting your established Roses deeper depends on the depth at which they are planted now. If they grow and flower freely we should let them alone; if not, you might try the plan you suggest, but on this point we cannot advise, since you have not stated the length of the stocks.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (F. M.).—1. *Dendrobium densiflorum*; 2. *Brassia Lanceana longissima*; we found but two flowers. (R. B. Halifax).—1. *Arnica montana*; 2. *Galium hybrid*, probably a cross between *mollugo* and *verum*; 3. *Allium Moly*; 4. *Campanula rotundifolia*; 5. *Orobanchus vernus*; 6. *Campanula persicifolia alba*. (F. L. Edinburgh).—1. *Crepis sibirica*; 2. *Eschscholtzia maritima*; 3. *Eschscholtzia Austineae*; 4. *Lactuca macrophylla*; 5. *Bocconia microcarpa*. (The Burns).—*Platystemon californicus* (Papaveraceae). (J. F.).—1. *Campanula lactiflora*; 2. *C. allariaefolia*; 3. *C. latiloba*; 4. *C. elegans*; 5. *C. pusilla*; 6. *C. garganica hirsuta*. (J. B.).—*Plagianthus Lyali*. (N. B. Kelso).—1. *Lilium croceum*; 2. *Hemerocallis fulva*; 3. *H. aurantiaca*; 4. *Lilium umbellatum*; 5. *Othonopsis cheirifolia*.

"All Cry and Little Wool."

"And my people love to have it so." This is the enlightened twentieth century, and it is the age of adulteration. There is not an article we use or consume which does

not afford to the unscrupulous a fine field for roguery. We have become past masters in the art, and now like evil birds our sins are coming back to roost. There is an outcry for everything cheap, and, dare we add, nasty. Where we wore fine linen and the softest of calicoes, now we resort to the wretched flannellette! We bought suits, and the first question was: "Is it all wool? Will it bear and keep this colour?" Now, if the "cut" is about right, we do not mind what sort of shoddy clothes our persons. The working man rejoiced in good serviceable fustian, now forsooth he must have a cloth suit like his employer (not his master)—the term is obsolete. It is one of the factors that keep him poor, for he has constantly to renew his garments.

Why are we so bitter just now? We are beginning to wake up a little to the fact that we are in this wool business robbing ourselves twice over. In the first place, there is no market for this great product of ours; and, in the second, by consenting to wear shoddy made garments we are effectually keeping closed our wool markets. What on earth is the use of merchants buying our wool if we are quite content with cheap substitutes? In olden days to encourage the home manufacture, the law was that all corpses should be wrapped in woollen cloth. If dead bodies needed wool, our poor living ones need it far more.

Last week we had the great Royal Show, when representative farmers gathered from the ends of the earth. We might almost use the list of names to be found in Act II., 9, 10, 11; in fact, it might be rather a long list, and among these men is a strong contingent of sheep fanciers and breeders. They have their International Conference, and this topic of adulterated wool is the first on the list of subjects for discussion. We must quote at length from the first speaker, Mr. A. Mansell, Shropshire. He says: "That in a drive of thirty miles around Bradford there are not only but scores of mills where for every bale of wool used, ten bales, and often more, are used of shoddy, mungo, stockings, and cotton, and that in the heavy woollen district of Yorkshire there are dozens of manufacturers who never buy a single bale of raw wool, and yet are known and acknowledged as influential manufacturers of woollen goods. Woollen," he says further, "may mean anything—shoddy, mungo, cotton." "All wool" is the only sure guarantee one can accept when buying would-be woollen garments. When we read of woollen stuff, 54in wide, and sold at 1s. 1d. per yard, what can we look for? If we will have such cheapness, we must be cheated. Mr. Mansell tells of an Army contractor for the supply of blankets who was found to be using 50 per cent. of shoddy.

America is just as bad, as shoddy there to the amount of 40 million rounds is displacing 120 million pounds of wool. American woollen fabrics are principally cotton! What a satire! If margarine may not be sold as butter, why in the name of all that's reasonable should woollen goods be sold as "all wool"? There are still many poor simpletons who need to be protected from fraudulent manufacturers.

What is shoddy? This is how the National Live Stock Association of U.S.A. describe it—as being the rotten, cast-off rags of European paupers, having in them all kinds and amounts of filth and disease. Dealing with the production of woollen goods from these materials, the Association writes: "To encourage such a fraud is simply putting the lousy rags of European paupers in competition with the sheep and wool growers of America and elsewhere, and robbing the consumers who wear woollen garments by selling the stuff under a misrepresentation." Those of us who live in the vicinity of seaports have heard a good deal at one time or another of the dangers arising from the importation of foreign rags. Let an epidemic break out on the Continent, then we are all for burning these wretched rags. Let the epidemic subside, and we hear no more about them, and the unholy traffic continues. At the English Conference on Saturday, July 5, one gentleman from Tasmania opined that it was the dear price of wool that encouraged this fraudulence; but really one would have thought the wool price had touched the lowest mark now, and we might have it used in a pure state. The New Zealand representative declared that, as touching this matter of inter-mixture, his country was at present free from blame.

In reference to working up the old rags into new "cloth," a writer in a daily paper recalls a fact in natural history new to us. Perhaps he is "having us," but we will quote it: "When the frog has done wearing his jacket, and crawls

out of it, he is said to roll the old one into a pill and swallow it, doubtless for the gradual manufacture into a new one. He is severely economical." This is the principle on which the great trades of shoddy and mungo have been builded up.

Our next paragraph we might head "A Storm in a Tea Cup," or, "Much Ado About Nothing." After having Free Traded ourselves practically to the verge of ruin, there has been a most tremendous and foolish outcry when, extra taxation being imperative, the trifling impost of 1s. per quarter has been put upon Wheat. It was taxing the poor man's loaf; it was a retrograde movement. The sods over Cobden and Bright had been seen to lift, and we were going back to semi-barbarism. We could hardly realise that there were men, and women too, who could talk such arrant nonsense. We have taxed the poor man beyond what he was able to bear, and so forth, and so on.

Lord Goschen has a word or two to say on the subject. He never loses his head or is carried away by passion, and he has tried to place before the public in plain figures where and how lightly the taxation will fall upon the individual. A bag of flour containing 280lb will be taxed at 1s. 0½d; a sack of flour will make 95 quartern loaves, or 380lb of bread, and the tax is thus a trifle over half a farthing on the quartern loaf. The statistics of the consumption of bread (we quote from a well-known paper) by the population of this country give an average of about 4-5ths of a lb, or 13oz per diem, and this is 9½d. per year per head, so that a family of five will contribute 4s. per year. Now a man cheerfully pays double and treble this duty on his "bacca," and says nothing, and his wife will pay through her tea a duty at the rate of 3s. per head per annum, and she also says nothing.

All the community must take their share in replenishing the National Exchequer, and we cannot think any easier or lighter method could be instituted. To set against this tax which is said to press so heavily on the poor but honest artisan, just let him bear in mind that he now is the only class who gets his children well educated; that is, thoroughly absolutely gratis. Every child costs the Government from 7s. to 10s. annually. Will he be willing to pay that if Sir Michael Hicks-Beach will remit the Corn Tax?

### Work on the Home Farm.

Farmers are notorious for everlasting grumbling, but we must put in a claim to be an exception to that universal rule, for he must indeed be a misanthrope who could quarrel seriously with matters agricultural at the present time. A fine hot week has been favourable to the saving of the crops of Clover, Cow-grass, and Sainfoin, and many meadows are now down in swathe. The root crops were inclined to resent the sudden change to heat and drought, and we had no sooner acquired a longing for a Turnip shower than down came the rain in just the quantity desired. One or two late birds who have Clover still in cock are grumbling, but perhaps they would be less happy had they nothing to grumble about. Certainly the rain has worked marvels, and there must be a fine root crop this season. We own to having made a wrong forecast last year, but one mistake in seven may surely be forgiven.

We are glad to see that Potato spraying is not entirely discarded, for a growing season like this may readily induce a bad attack of disease. It is not yet too late to use the Strawsoniser; in fact, growers who do the thing thoroughly may give their crops two sprayings after this. Of course, much depends on the soil and situation. On low-lying heavy soil, moderately drained, spraying can hardly fail to pay, even if it only keeps the haulm in a growing state for an extra week. On very light soils, and especially in connection with second early kinds, which will meet a forward market, there may be some doubt as to the commercial value of spraying; but, even in such cases, there is a doubt, and it is better to be on the safe side.

With a cessation in haymaking, we can put all hands to Turnip hoeing. The skerry is most useful now, and can hardly be used too much, for every stirring of the soil seems to put fresh vigour into the young plants. It is rather a heavy labour bill we have to meet for weeding. The weather which suits Turnips suits weeds no less, and we must not let them get big and strong, or entire eradication may prove well-nigh impossible. The Mangold, which we had fondly hoped were placed "on the mantelshelf," have required further attention. Weeds which were too small for observation at the last weeding have been lately only too obvious. This is one of the penalties of early sowing. Mangolds which are sown early and grow slowly cost thrice the money for weeding which late-sown Turnips do.

Stock generally are healthy, and good to sell. Pastures are as satisfactory as prices, and we must congratulate our grazier friends on what should be a record season.

ESTABLISHED 1832.

Successors to the late BARON VAN PALLANDT.

# ANT. ROOZEN & SON'S CELEBRATED BULBS

— FOR —

Early Forcing.

ROMAN HYACINTHS,  
ROMAN NARCISSUS,  
PAPER-WHITE NARCISSUS  
&c., &c.

The above are now ready for delivery, and for full descriptive details of the same and other BULBS for forcing, see our CATALOGUE for 1902, which will be sent free on application to our Offices at OVERVEEN, HAARLEM, HOLLAND, or to our General Agents—

Messrs. MERTENS & CO.,  
3, CROSS LANE, LONDON, E.C.

## HARDY WATER LILIES AND OTHER AQUATIC PLANTS.

Great Speciality.—New and Old beautiful varieties delivered by Parcel Post during the Spring and the Summer, which are the best seasons for planting them.

B. LATOUR MARLIAC, Nurseryman,  
TEMPLE-SUR-LOT (Lot-et-Garonne), FRANCE  
Lowest Prices. Catalogue free on application.

## BEGONIAS. GOLD MEDAL COLLECTION!

Four Gold Medals and Four First Prizes in 1901.  
THE BEST COLLECTION. SEE OUR CATALOGUE.

B. R. DAVIS & SONS,  
Yeovil Nurseries, YEOVIL, SOMERSET.

## £20 Cash Prizes

THE FINEST CABBAGE IN THE WORLD.  
DANIELS' DEFIANCE.

A VERY fine, short-legged, compact, mid-early variety, growing to the weight of 10 lb. or 12 lb. each; exceedingly tender and of the most delicate marrow flavour. A grand Cabbage alike for the market or private grower.

We offer £20 in cash prizes for two heads of this variety grown from Seeds sown this season. All purchasers of not less than one ounce of Seed will be eligible to compete. Competitors' vouchers, conditions, and full cultural directions sent with seed. Our own specially selected stock, per oz. 1s. 6d.; per packet 6d., post free.

Catalogue of the best Cabbage, Onion, and other Seeds for present sowing, choice Strawberry Plants, Bulbs for early forcing, &c., post free on receipt of post card.

DANIELS BROS. L<sup>TD</sup>  
BY ROYAL WARRANT  
TO H.M. THE KING NORWICH

FOR PRESENT SOWING.

## MIDDLEHURST'S Reliable Early Flowering Bulbs

EARLY ROMAN HYACINTHS,  
Extra selected Bulbs, averaging 6 inches in circumference.

EARLY TRUMPET DAFFODILS.  
For Christmas Blooming.

EARLY CHRISTMAS DOUBLE DAFFODILS.  
May be had easily in bloom by Christmas.

FREEZIA REFRACTA ALBA.  
Immense Bulbs. Samples free on application.

SOW NOW.

MIDDLEHURST'S SELECTED STRAIN OF  
CALCEOLARIAS.

See page 87.

Illustrated and Descriptive Catalogue of Bulbs ready  
early in August, post free on application.

MANCHESTER STREET, LIVERPOOL.

## CABBAGE SEEDS.

The best and hardiest variety is—

Dicksons Perfection, 6d. pkt., 1/6 oz.

Also highly recommended—

DICKSONS NONSUCH, 4d. per pkt., 1/- per oz.

ELLAM'S EARLY SPRING, 4d. per pkt., 10d. oz.

MEIN'S No. 1, 3d. per pkt., 9d. per oz.

WHEELER'S IMPERIAL, 3d. per pkt., 9d. per oz.

MYATT'S EARLY OFFENHAM, 3d. pkt., 9d. oz.

PRICED CATALOGUE post free of all other Seeds  
for present and later sowing.

DICKSONS SEED GROWERS, CHESTER

EWING'S MILDEW COMPOSITION.—The original, certain, and safe remedy; in bottles, 1/6 and 3/- per gallon, 12/- Sold by all Seedsmen.  
CORY & CO. (Limited), London, E.C.

Journal of Horticulture.

THURSDAY, JULY 24, 1902.

## The Onion.

HE Onion—the bulb of pungent odour and an unmistakeable flavour—is perhaps one of the most important vegetable crops there are. Next to his Potatoes, the humble allotment holder will give his closest attention to, and keep his keenest watch on, the Onion bed, and wherever the working man, who is an amateur horticulturist, has a piece of ground to call his own on which he can grow vegetables, it may safely be asserted that that man's family shall not want for Onions, both for eating in a raw state and eke for flavouring other dishes.

A vegetable of antiquity it is—no modern upstart of a bulb, but one that was valued and appreciated in classic times. Recent discoveries among the pyramids have established the fact that it was well known to the ancient Egyptians four thousand years ago, and in history we may read how, when the Greek and Persian armies faced each other ready to do battle, while the luxurious Persians feasted on the richest viands and drank the choicest wines, the more hardy Greeks made their simple meal of bread and Onions, washed down with pure water, and admirers of the tunicated bulb with a series of concentric coats of fleshy tissue completely surrounding the central axis, or growing point (as the botanists describe it), have gone so far as to say that their favourite vegetable had not a little to do with the subsequent victory of the Greeks. And if it was considered indispensable twenty-two centuries ago, it is no less lightly regarded by many people now, though in these days it generally finds itself in more pretentious company than that of bread and water.

It might seem that Onions and sentiment have little in common. The poet Keats has told us of Isabella weeping over her pot of

READERS are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

Basil, the pathos of the faded Rose and Forget-me-not has often been dwelt on in story and song, and yet we will venture to assert that the useful, prosaic Onion, the bulb of the many tunics, has been the innocent cause of more tears than any other plant that ever was. What a mighty host there would be could all the busy housewives and industrious serving-maids who have wept silent tears as they shredded those concentric coats of fleshy tissue, slicing up an Ailsa Craig or a Bedfordshire Champion even to the central axis, be collected in one place.

It is only to be expected that a plant so universally grown should not be exceedingly difficult to cultivate, though to get it to perfection a certain amount of care is necessary. It delights in a rich, deeply-worked soil of a somewhat retentive nature, one not by any means as strong as the flavour of the Onions themselves, but not too light and sandy, or the yield will not be so heavy. To trench and throw up the soil in ridges the previous autumn, levelling it down and breaking up with a fork before sowing, is the best method of preparation, and a sowing may be made early in March if the ground is in good condition. It is important that the soil should be sufficiently dry, as the bed should be rolled or trodden firmly all over, and, if sticky, a quite unnecessary amount of soil will be moved, and hobnailed boots are not the most recently devised implements for altering the site of a kitchen garden. Treading is preferable to rolling if time can be spared, as the ground is thus better consolidated, and here, if nowhere else, he who takes a small size in foot-gear is at a disadvantage.

We recollect, in a certain private garden, an old labourer whose pedal extremities were, to say the least of it, not less than normal in area. The youngsters sarcastically nicknamed him "Cinderella," and used derisively to ask him if he would like the walks made wider, and why he didn't set up business as a steam-roller; but the old chap was good natured, and only laughed. But when the spring came round and it was time to tread the Onion bed, "Cinderella" tied up his trousers below the knees, took on an air of importance, and began to be mighty in the land. Well, he knew that no one could touch him at that job, for he was a host in himself, and if Onions required a firm root run, a firm root run they should have, or he would know the reason why. With a well consolidated soil, the bulbs are of a more compact habit, less leafy growth takes place, and the necks are thinner, and to possess a neck long and slender, fit to wear the tallest of aristocratic collars, should be the ambition of every high bred Onion.

Spring sown Onions should be put in in drills about 1ft apart, and  $\frac{1}{2}$ in to  $\frac{3}{4}$ in deep, though market growers often find it more profitable to sow them broadcast with other crops, such as Lettuce or Radishes, which, of course, are off the ground before the Onions are very large. As soon as the plants can be conveniently handled they should be gone over and thinned, and later, the product of a second thinning, which will leave them 6in or 7in apart, can be used for salading. The Dutch hoe or scuffle may be kept busy between the rows, especially in dry weather, for weeds on an Onion bed are vegetation distinctly in the wrong place, and, like the wicked, should have no peace. Only the surface should be disturbed, however, as it is essential that the bed should remain solid.

An occasional dressing of nitrogenous or phosphatic manure, or soot, or a mixture of all three (sulphate, superphosphate, and sootiate, we heard a gardener call it once) is very beneficial in stimulating the growth and increasing the weight of the crop. When the bulbs are ripe, which is indicated by the leaves turning yellow, they should be pulled up and laid out with their bases toward the sun, so that they will thoroughly dry before storing. They may be stored in any cool, dry place, either hung in bunches or covered over with straw, and if properly ripened a little frost will not harm them.

Onions may be sown in autumn, in August or early in September, for pulling for salading in spring, or for transplanting about April and growing on. Autumn-sown Onions, thus transplanted, with the roots preserved as much as possible, grow to a large size, and it is thus that those Goliaths of the bulbous world, of portly presence and imposing aspect, which cannot be sold by the pound, are obtained. The growing season may also

be lengthened by sowing the seed in pans or boxes, and placing in heat in the beginning of the year, gradually hardening off in a frame, and planting outdoors in April. Onions thus treated will be larger than if sown outdoors, and, being forwarder, will be less liable to fall a prey to insects, though the method is too expensive to be carried out on a large scale.

Unfortunately the Onion has another ardent admirer, whose persistent attentions are by no means appreciated by gardeners generally, namely, *Anthomyia Ceparum*, commonly known as the Onion fly. This obnoxious little insect is the bane of many Onion growers, its capacity for mischief when allowed to carry on its depredations in peace is remarkable, and continued vigilance is often necessary to circumvent it.

By keeping a careful watch, and adopting preventive measures in time, it can, however, be generally kept under, and no one need despair of raising a crop of Onions in spite of it. Perhaps no grower ever did actually decide not to attempt the culture of this plant because in doubt as to how much of his crop *Anthomyia Ceparum* might be disposed to leave him, though we once met an agricultural student who was convinced that Turnip growing could never end in anything but failure. He had taken copious notes of a lecture on Turnips, and on reading over what he had written on the enemies, entomological, fungoid, and parasitic, to whose attacks they were liable, he found it ran somewhat in this fashion: "Turnip Fly. Only prevention: sow the crop early and hurry on. Turnip Moth. Only prevention: sow the crop late and keep back." And the poor fellow scratched his head and knit his brows, and speculated as to how on earth he was ever to get a crop of Turnips at all.

The insect in its perfect form is a small fly about  $\frac{1}{4}$ in in length, the male being of a blackish-grey colour, and the female having a yellowish tinge. It deposits its eggs about April or May in the axils of the leaves or on the soil close to the Onion, and when these hatch out the larvæ make their way to the base of the bulb, and gnaw into the interior, where they take up their undesirable residence, obtaining food and accommodation free of charge, but at considerable cost to the Onion-grower, whose consent to the arrangement is never asked. Its presence is indicated by the leaves turning yellow and flagging, for it makes itself so much at home that the bulb begins to go rotten. After about fourteen days, having eaten its fill, the larvæ leave the Onion, and, entering the ground, develop into the pupal stage. If they enter this stage in the autumn they hibernate until the following spring, but if in the summer, they emerge perfect insects in two to three weeks time, to deposit more eggs to hatch into more maggots and devour more Onions.

But though destructive enough, there are remedies against it nearly as numerous as the patent medicines we may read of in advertisements, and some of them possibly much more effective than those medicines, and, what is better, there are various preventive measures which can be adopted. One of these is to dig the top soil in after a crop of Onions, thus burying the pupæ, and to destroy any old bulbs left on the ground after the crop is cleared. Wood ashes placed in the drills before sowing will also be of use in keeping the insects away, and if a few plants show signs of turning yellow they should be immediately pulled up and burnt.

Several means are recommended to destroy or drive off the insect when they make their appearance. Soot is a useful insecticide, dusted over the plants when moist with dew, and the Onion fly has an equally strong aversion to salt, in which he differs from the caterpillars which are said to have attacked an old farmer's Lettuce plants. The worthy man was recommended to try both soot and salt, and he declared that while the caterpillars cared nothing for the soot, when he applied the salt they simply picked the leaves, dipped them in it, and ate them with the more relish. Paraffin is useful mixed with water, or sand may be soaked in it and sown along the rows; lime mixed with soot is effective, either dissolved in water or sprinkled over the leaves at intervals of ten to fourteen days. Soapsuds have also been highly recommended. Thus there is no lack of remedies, and if after being choked with soot, pickled in salt, oiled with paraffin, and scorched with lime, they laugh wood ashes to scorn, and cannot be cleansed out of existence with soapsuds, some heroic individual has advocated the use of sulphuric acid as a last resource. Apply this with sufficient liberality and specimens of Onion fly will be scarce in that neighbourhood, and so, very possibly, will Onions.—A. W. D.

*Lælia crispa superba.*

Herein we have an autumn flowering Orchid of high merit. The lip of this variety is velvety purple shading almost to mauve, and is beautifully crisped and fimbriated. *L. crispa*, the species, is a Brazilian plant, and was introduced in 1826 by a Sir Henry Chamberlain, who sent plants to the Royal Horticultural Society's Gardens at Chiswick. The pseudo-bulbs are 8in to 12in high, bearing a stout, solitary leaf nearly a foot in length. The spikes, rising from a yellowish green sheath, carry four to six flowers. The sepals are white, and the petals, which are broader, have wavy and crisped margins, being coloured purplish at the base.

#### The Week's Cultural Notes.

Pleiones are now growing freely, and the roots must not be allowed to suffer for want of water. They like a sunny corner in the intermediate house, and should be looked after as regards insects. Later on the foliage will be seen to turn colour preparatory to falling, and this is the time to slightly decrease the moisture supply. The different species flower consecutively over a long season, and a collection of them is very interesting.

A useful overflow for the cool house now is a frame or pit in a shady corner of the garden. Just an ordinary garden frame may be used, placing a brick under each corner to allow a current of air to pass, and tacking a narrow piece of perforated zinc around this to prevent mice or other small animals entering. The floor must be well covered with sharp ashes, smiths' ashes for preference, and a little soot and lime may be sprinkled over this. The plants themselves may be stood upon inverted flower pots of varying height, to bring them up to the proper level. This will be a capital place for any of the cool species to finish their growth. The crispum and similar species of *Odontoglossum*, *Oncidium* of the macranthum section, *Epidendrum vitellinum*, *Ada aurantiaca*, and many others may be all placed in it to their own benefit, and this will give more room in the house.

The frame should be damped early in the morning, avoiding wetting the surface of the compost wherein the plants are growing. If this is done, it will be difficult to see which plants require water at the roots. These should be seen to fairly early in the day, and watered not with the spout of the can, but with a rose syringe, this forcing the water into the compost, and ensuring a thorough moistening of the whole of the roots. A very fine spray may be given overhead several times daily, and the pots, floor and sides of the frame kept always moist by syringing.

Look out for all the *Dendrobium* as they finish their growth. It is early yet, but in a very few weeks *D. aureum* and others will be finished. As soon as the last leaf has formed, they must be placed in the full light to ripen, and still kept moist. As the foliage turns colour, reduce the water supply, and place the plants in a vinery or greenhouse to pass their resting stage. No *Dendrobium* will flower freely without proper attention to these details.—H. R. R.

#### Orchids of Commercial Value \*

In the past, when the demand for choice flowers and variety was not so great as it is to-day, most of our Orchids belonged to a limited number of private individuals; consequently, few flowers found their way to the flower stores or came before the general public. The few Orchid flowers then to be seen were looked upon more as curiosities than as an article of trade. The price, also, was beyond reach, and although they were much admired for their beauty, it seemed that Orchids never would become popular, as the supply was limited. The grower would not invest capital or spend much of his time on a plant for which he thought there was no market. Difficulty was also experienced in finding a person competent to grow this, then little known, plant. The grower must therefore personally take charge of and look after his plants, and he would rather do that than entrust his comparatively large investment in the hands of an inexperienced or incompetent assistant. The retail merchant or storekeeper was equally careful in buying flowers he had small chances of selling, or to take an order for goods he was not sure to be able to fill. Under those conditions, the risk was naturally great on all sides.

But times have changed in the last ten years. It is hard to say where we are going to stop. Orchid plants number well up in the millions; flowers are cut and sold in much greater number, at a profit to the grower of tens of thousands of dollars, and still the demand is ever increasing.

Plants can never be cheaper, or the supply, I believe, more abundant than at the present time. Here are a few of the reasons:

Orchids cannot be propagated by cuttings to over-production, as is the case with most other plants. It is a very slow process, indeed, to propagate them by division, and it takes several years for the most of them to attain their flowering period from seeds. We must, therefore, depend almost entirely upon importations from their native growing places. But even there the supply is getting smaller year by year, and it is, perhaps, but a question of time when it will become altogether exhausted. The immediate cause is the thoughtless, unconscious and "don't care" Orchid collectors, the cutting down of the forests, and the needs of the ever-increasing population in these districts.

On the strength of this we may, therefore, say that an over-production of this equally interesting and beautiful genera is next to impossible. The opportunity for the Orchid grower was never better than it is to-day. The demand is always increasing, and the supply nearly always limited. Orchid growing has be-

come a trade of no mean reputation. May it continue to prosper, thus making a change in the monotony of the everywhere appearing Rose or Carnation.

Years ago, when I was a little more connected with the commercial world than I am now, not more than 10,000 *Cattleya Trianae* and as many *Cypripedium insigne* sold in Greater New York every year, and all those were grown in the vicinity of New York City. New York, however, is not the only city with a demand for Orchids, and the New York growers are not the only ones that can grow them. No, the field is open over this whole broad land of ours.

We have a long list of varieties, equally as good as the *Cattleya Trianae* and the *Cypripedium insigne*, only waiting to be introduced, and, when that is done, I am positive they will become popular, appreciated, and dearly loved by the intelligent and flower-loving public. In making up a collection it is, of course, necessary to choose such plants or varieties as promise to bloom through the whole or greater part of their respective blooming season.

To be continued.

\* Read by Robt. Karlstrom before the Hartford (Conn.) Florists' Club, January 28, 1902.

*Lælia crispa superba.*

## Gardening Among the Ancient Romans.

The Romans called the garden "hortus" or "ortus," but they gave this name also to their "villas." As such is the case, it may be interesting to give some idea of what a Roman villa was. The place in question appears to have been a nobleman's country seat, where, together with his luxurious gardens, were quite a number of houses, besides the family residence, for the accommodation of slaves and other servants and dependants. Also the stables, farm and its offices, comprising storehouses, barns, graineries, stockyards, &c.

Attaching to the family residence itself were the gardens, tennis courts, and baths, and in close proximity were places for rearing hens, geese, hares, rabbits, ducks, bees, birds, snails (of which the Romans were very fond), and many other similar places with things and animals, which contributed both to the pleasure and utility of the family's requirements. Several acres were set apart as a park for deer and wild beasts. Besides there was the piseina, or fish pond. This, briefly, is something the nature of what was termed a villa and sometimes "hortus." It will be seen that it was a very different place from what we understand by the designation. In some cases the "villa" had more the appearance of a modern village than any resemblance to the isolated building with its scanty flower pots and gilded railings ornamenting its confined frontage, known to us as the ordinary villa of the present time.

The Romans loved their gardens more superbly—passionately, perhaps—than we do, and though they were probably not such good gardeners as ourselves, they brought equally as much zeal and enthusiasm into their art and operations. Indeed, in many cases they brought very much more. If the situation was deficient in a supply of water they spared no expense to bring the necessary commodity into the garden in pipes or open canals. In some cases the water supply took the form of a considerable stream, which was called "nili."

The various references in the Classics to those centres of grandeur and luxury prove that the pleasure derived from a beautiful garden is no modern thing, and that the Roman was no less a diligent gardener than he was a good soldier. If we eliminate the fabulous gardens and the golden Apples of the Hesperides, Adonis, and Alcinous, together with the pensiles horti, or hanging gardens of Cyrus at Babylon, the Classics still afford us evidence of the Roman's zeal for his "hortus."

There were no less than eight noted gardens within the precincts of the city itself, probably no mean centres of the art as then practised. Those were the Horti Cæsaris, H. Martialis, H. Lucelli, H. Neronis, H. Pompeii, H. Salusti—this was the garden of Sallust the historian, and eventually came into the possession of the Emperors—the H. Senecæ and H. Tarquini Superbi—said to have been the oldest garden in the city. The citizens, too, were much interested in the decorations of their windows with flowers and plants.

In the earlier stages of the art of gardening the "Hortus Pinguis," or what is equal to our kitchen garden, engaged the attention of the Roman people. Here was cultivated herbs, fruit trees, vegetables—such as Beans, Peas, Kidney Beans, Lentils, Lettuce, Turnips—and many other things. It is noteworthy to observe that it was the pods or siliquæ of the Turnips which were used. Many of these vegetables, no doubt, would be utilised as food for the slaves, and probably for some of the many animals kept by those people. In ordinary cottage gardening the housewife was the gardener, and then, as now, her capacities for regulating the order of the interior of the domicile was inferred from the taste she displayed in the order and cleanliness of the garden.

Later in the history of the Romans, and as they advanced in refinement and grew wealthy with spoil imported from subjugated nations, the "Hortus Pinguis," gave way to a more luxurious and ornamental style of gardening. This consisted very much of enclosures with arbours, walks with overhanging trees, evergreens, and statues here and there interspersed. The cultivation of evergreens was carried on to a pitch which was at once grotesque and fantastic. These were trimmed into all manner of forms and shapes, the art of which was called "opus topiarum."

Outside the garden proper was another place of no less beauty, and which corresponds to our pleasure grounds. It was called the "Ambulacra," and was more extensive than the garden, having beautiful shady walks traversing it. Here also was a place set apart for the exercising of the manly sports that the Roman people delighted so much in practising.

The Olitor of the Romans, notwithstanding all this show of grandeur and increasing development in his art, as far as can be seen was a slave. And though his ingenuity must have been considerable in perfecting the operations of the topiary, as well as promoting the no less entrancing mysteries of the graft and scion, there is little evidence that any of his efforts were honourably rewarded with a call to the dignity of the higher offices.—D. C. H.

## Dream Faces in Coronation Pansies.

I have always held there is more than appears at first sight in the many visaged little modesties of our gardens; not that they are all modest by any means, as I hope to show by-and-by. And this Coronation year I am all the more convinced of it as the aspects of my favourites seem more defined and individual than ever before. The whole tribe is, in fact, an absolute study, and if carefully read, you can see not only their present but even their past and future! There are virtuous and vicious ones, modest and assertive ones, happy and unhappy ones, cruel and kind ones, laughing and grave ones; and this year of grace, full of hope and pregnant with possibilities, there is also positively a distinct set of royal ones, headed by an impossible-to-be-mistaken king and queen of exceeding beauty.

For the most part I am bound to confess my floral impersonations represent the fair sex, but by no means invariably. Moreover, now and again some special subject is represented and that in a peculiarly vivid manner. No one, for instance, walking round my borders could fail to note my "silver lining to every cloud" one, a Pansy of striking beauty and of very dignified bearing; neither would one pass in silence my "Sunset," though there are really two of these, one where the scene is lurid and stormy but highly majestic, and the other of a much calmer type. But let us take a promenade, and we shall meet, I trow, with much of interest, and make some pleasant acquaintances, I trust. Rather appropriately, almost the first we come to represents "Dawn," a pale centre with a darker outline, which promises to merge entirely into the former, and with a suspicion of the sun appearing on the horizon in the guise of a narrow streak of yellow on its extreme tip. Skipping two or three groups of more or less insignificance, especially a rather obnoxious one with "Street Arab" plainly delineated in their features, we come to an unmistakable "Sunrise," and a rather gorgeous one at that; the whole surface of the flower being bathed in a warm red glow. And now we are well floated on our enterprise, and getting, so to speak, out into the swim.

Though rather bewildering, we must pull ourselves together and discriminate, or we shall get into difficulties, for some of our friends are extremely capricious, while others are susceptible to a degree, and most particular as to whom they represent. Who is this exceedingly shy and diffident looking little thing in almost pure white—petite also, and surely nothing like full grown? Neither is she. It is, in fact, a sweet little maiden not very long promoted to the schoolroom. Rather a contrast to her neighbour, who is clearly a dowager, and a haughty one, too. Somewhat overdressed, many would say, and her rich velvet is rather of a flashy hue, albeit of an evidently costly fabric. Close by, also, is another smart lady, all very fine and large, to use a vulgarism; anyhow, of ample proportions, and in this case in low dress. Her gown, a purple one, is a good foil to the whiteness of her neck and arms. But whoever is this? A politician, I shrewdly guess; he has a slight stoop, with a distinguished, clever face; and hard by, apparently talking to the former, is a diplomatist of erect carriage and keen eagle eyes which appear to look right through you. "Oxford and Cambridge" comes next, the two blues blending in admirably together, as only Nature's own colours can, and rather appropriately, not a yard off, our dear old "Eton," or as near the hue as a Pansy is ever likely to obtain. And here we come to a whole bevy of fair ones. They are fluttering about and seem rather excited; possibly some "mere man" has been telling them that in the Caucasus they bury their sisters deeper than the other sex because of their inherent restlessness, and I rather think this may have flustered the pretty dears.

They are pretty, too, and there's no denying it. The nearest is a delicate-looking blonde, next to her on the off side is a peculiarly sweet-looking girl, surely still in her teens, and slightly blushing, apparently; a great contrast to the one immediately behind her, a pale beauty of a very distinct type, and who, in her turn, is quite different to another on her right, who possesses a somewhat distressingly rubicund complexion, and suffers a trifle from embonpoint. A taller one in the same group has a more pleasing appearance from having the "red" more favourably placed. "The cherric of her lips" is, indeed extremely becoming, and I think so deems that rather distinguished-looking gentleman of unquestionably blue blood, not ten paces distant. What a pity life is such a mixture, but it is ever so! Here is rather a horrid person to be about. I much fear she has been drinking. Just look at her face, it is all blotchy. Let us hurry on and inspect these jolly little school-girls. They look as happy as the day is long. Altogether a ripping little crew! Naughty creatures, they are laughing at a boy of about their own age, who happens to be endowed by nature with a moon face.

And, talking of the latter, on exactly the opposite border there is a real "Moon," mysterious, cold, and rather awe-inspiring, but beautiful withal. A step or two beyond that clump of Sweet Peas just opening their sweetness (I was going

to say, to the desert air, but I fear our friends now under discussion would not feel flattered), we come across a young girl with a visage labelled "fast." Her eyes show it unmistakeably. Aha! just as I expected. Hats off, gentlemen, for the King! No failing to recognise that blue, even if one did not distinguish the ermine for a moment. Her Majesty, too, in a vesture of gold! Who's this in their train? The First Lord, judging by his pincenez, and—ah, yes, that tall, rather stern gentleman with a military bearing is sans doute the late Sirdar, back from his recent scenes of action, apparently. Hello! Gracious me, I mistook you for a cat, madam. 'Pon honour, I crave pardon, but you resemble my tabby to a T; you do, indeed! Well, sir, what are you laughing at? Faith, your mouth looks like splitting. Oh, I understand. Yes, that's funny, certainly—"dignity" and "impudence" over again, evidently—you very tall lady with the white frilling of point lace, and the puce-coloured bodice, rather superciliously looking down upon that roguish little urchin scarce reaching to her waist, with large gipsy eyes and fresh coloured cheeks. And there's "Granny" at last, hard by that flowering Berberis; dear old lady, just ready for the opera, in a damask heliotrope with shades of grey to match. Deary me! What a shame, actually a baby! Whose olive branch are you, little one? There, don't cry so, your eyes look quite red and sore. Your neighbour doesn't look much better, either. How splashed you are, sir! Been out in the rain, perhaps, or made a night of it and not come home till morning? No wonder you look a bit pale, too. One couldn't teach you much, I reckon; what you don't know isn't worth mentioning, judging by your face!

Now, really, my good sir, you're not in black, though you're trying to pretend you are. Apeing the parson perchance, and, "birds of a feather, &c.," quite in keeping, certainly. So your friend's masquerading, too; but this seems a more serious matter—a young man in the garb of a woman. You're detected, however. Why, I can see your dark trousers beneath that spangled skirt. Now, how very odd! Just round this corner, and nodding to each other across the pathway, are "Peace" and "War." How furious the latter looks, full of passion; envy, jealousy, and hatred are clearly depicted; but the former's visage is one of calm serenity, not a cloud or speck to mar its look of absolute repose. "Sunshine" and "Rain" at rather opposite points of vantage are interesting in their way, though I like the former best, the wealth of gold of the first-named seeming to light up some kinsmen immediately surrounding. It was just at this juncture that, I regret to say, we came across an old offender—no less a personage, in fact, than the redoubtable Mephistopheles. He was looking about as luridly red and diabolical as he is generally represented, parts of him appearing to merge into the blackness of Tophet. Positively we were not sorry to turn away our gaze.

And now we must hurry on, for we are about to pass one of those dangerous syrens, a daughter of Eve, certainly, but like Cleopatra, one whose life work is clearly to fascinate and ensnare. Just a glimpse and no more. Mark her eyelashes. Ah! cruel beauty, I am no Mark Anthony, I assure you. Prithee, let me pass. What a relief! And now we are safe again; but glance over your shoulder, we had almost overlooked in our haste quite an object of compassion. "Pity me, kind sirs," I feel sure I heard her say. Poor wee pale morsel of humanity—I mean, of course, "florality." But how did you come to look like that? Ah! the usual sad tale, is it? Jilted? But perhaps it was your fault. No? Ah, well, cheer up. Don't droop so in this beautiful sunshine. Life may yet have much happiness in store for you.

A sharp turn to the left brought us to quite a different state

*Corydalis thalictrifolia.*

fellow over there, pulling that fearfully long face and exclaiming "I am slain by a fair, cruel maid," is one of your victims. But time presses, and—

Dear, how exquisite! So you are engaged, are you? Well, I don't wonder. You've the complexion of a Peach, but who to? That man. H'm, I don't admire your taste, I'm afraid. Great bloated creature with staring eyes and vicious-looking nose. One more turn round that clump of Rhododendrons, and I see our tour is over.

Why, you're looking bilious, sir. What's up? Seasick, is it? That all. I should think a look at that face yonder the best antidote for you, if there's anything in the saying, "like cures like" (though the young lady must understand I only allude to the colour). Anyhow, there's no fault in her looks. "A sweet girl graduate with her golden hair," methinks. Ah! we can't all be young, can we, though you, madam, seem to think we may. If it didn't seem rude, now, I should call you an elderly young lady. But I won't disturb you, anyway, or that flashy-looking youth with beaming countenance and white Gladstone stick-ups. I rather prefer, I think, that matronly-looking dame in the handsome but quiet brocade of figured blue, who seems to be chaperoning the demure little pink and white demoiselle. There is peace in the look, too, of a very ladylike woman vis-a-vis, talking to the stout dowager, whom (the former, I mean) I pronounce to be an old maid. Rather pale, dignified, and with a benign countenance, very kindly, moreover, surely distinctly good-looking in her youth.

Ah, me! How time has flown! Here we are at the end of the broad walk and our round. Addio, friends all, old and young, or let us say, rather, a riverderci.—J. A. CARNEGIE-CHEALES.

#### *Plumbago coccinea.*

It has often surprised me that this useful and showy plant should be so seldom met with where winter flowers are in demand. It is, I believe, a native of East India, consequently requires warm treatment, and when well done is a magnificent object of floral beauty, producing panicles of large red blooms upwards of 2ft long. It is very light and graceful when cut and arranged with suitable foliage, and lasts fairly well for room decoration. I find this plant is not so easily injured by fog and smoke as many other things are. It grows admirably in a compost of peat, loam, and leaf soil, with a sprinkling of sand. —J. EASTER, Nostell Priory Gardens.

of things, and justified our exclamation: "Why, what's the matter now? You are angry, and no mistake! You quite frightened us. Insulted, were you—what, by that wretched-looking old haridan over there in those painfully crude colours? There, calm yourself. Your brilliant purple is not much better, and seems a bit out of place in your immediate surroundings, for that modest coterie hard by, with white frocks and blue scarves plainly betokens a wedding. And in effect, so it is. An almost perfect bride! What a sheen of white, how lovely a self! Well-a-day, here's a contrast. Good gracious! how absurd! My good woman, have you any idea what colours you are combining on your person? No? Why, then, let me tell you you've all the colours of the rainbow at least, and I think more too, only I can't stop to count them. Ah! that's better. How coy! We hardly saw you, screening yourself beneath that Fox-glove. Oh, yes, of course, we know the proverb, "Coy as a woman, and fickle as she;" nevertheless, my dear, you are pretty, and no mistake about it. Just let me chuck you under the chin.

And I suppose that poor

### In a Garden of Roses.

Imagine if you can, a garden set amongst the high Derbyshire hills, placed with its back to the north wind, and overlooked by towering limestone rocks, from the top of which the most secret places in this garden may be peered into. An idea can be obtained from this that the picturesque element is by no means lacking in the situation and its surroundings. In winter there is apt to be too much scenic effect, with far too little in the way of shelter to mitigate the cruel effects of the long and trying winters, which in such a neighbourhood our favourites must, with more or less success in withstanding, undergo.

This season has been an exceedingly trying one in the district I am speaking of. Roses of all descriptions were very slow to commence growth, and a cold wet June served to still further retard activity in leaf and bud. Pests, of more than one kind, have been unusually prevalent—mildew, maggots, and the always-to-be-expected green fly. Yet, on the day of my visit, I found a feast of Roses sufficient to have satisfied, if not satiated, the most ardent of Rose worshippers. Here were "Gloires" on the Briar, and on their own roots, trained to walls, and in pillar fashion to poles, all flowering in such profusion as only this old favourite can. Maréchal Niel, growing on a south wall, was carrying some lovely blossoms, large and highly coloured. One is naturally somewhat surprised to find this Rose thriving so well in the open in this part of England. Notice is taken of great masses of Souvenir de la Malmaison side by side with Cramoisie Supérieure, the rich crimson of the latter contrasting well with the pale Malmaison. Upon the same wall a splendid note of colour is struck by Paul's Carmine. A splendid plant this, lightly pruned, and with as many as possible of the young growths of the preceding year allowed to remain, a most beautiful picture was the result. Somewhat fugitive are these singles, but unless one is simply a rabid exhibitionist, there is not much to be said against them, they are so charming while they are with us. Paul's Single White, though not so showy as the above, is pretty and free flowering, and useful withal for vases; the buds on a spray opening readily in water, and lasting some days after cutting.

Planted upon the north of a four-foot wall were found the Penzance Sweet Briars. Here Rose Bradwardine, Brenda, and many more of Scott's heroines were freely producing their lovely flowers. Long shoots 8ft or 9ft long, fastened down their full length, had "broken" at every joint, and each shoot was topped by a small bouquet of the richly scented blooms. The treatment consists of cutting away a great part of the old wood each season, and laying down the strong shoots already spoken of, and which year after year are ready for the process, with unfailing regularity.

A good many people will tell you they know Maiden's Blush—or the Rose of that name—quite well; but not so many would be able to describe Celeste. This is a charmingly fragrant Rose, the colour a few shades more fiery than Maiden's Blush, but the shape of the two Roses is identical. The foliage of Celeste may be more inclined to be glaucous than the other, but except in colour there is great similarity between the two. Buds of Celeste are splendid for decorative effect, especially for table work.

Long narrow beds, containing many hundreds of Chinas, claimed attention. That known as the common Monthly was well represented, as also the one known as Hermosa. Many thousands of flowers are annually gathered from these, and they are much appreciated. Where cut Roses are in large request, these Chinas deserve more than mere cursory notice. They are wonderfully easy to grow, and flower with wonderful freedom until the frosts of autumn end their beauty and sweetness.

I saw ramblers of all sorts in great profusion of growth. Pink Euphrosyne, a lovely climber this; the Dawson, another pink, with individual flowers larger than those of Euphrosyne, but the colour is not quite so glowing; Thalia, the white rambler, and Aglaia, the yellow. This last named has been thought rather shy to flower, and in the early stages there may be some truth in the accusation, but as seen here growing against a tall oak fence, it was beautifully floriferous. For the Crimson Ramblers I was too early. Grown on the walls, against poles, or to espalier wires, the promise was the same in all cases. A multitude of fiery hued blossoms to open and light up many a nook of that old garden.

Amidst all these climbers and old fashioned Roses, it must not be supposed that the H.P. or Tea sections are neglected. Long narrow beds are provided, in which many old favourites, as well as the newer kinds may be found—Fisher Holmes, Etienne Levet, Helen Keller, Mrs. John Laing, amongst many others, I noticed in fine form; Marie Van Houtte, Hon. Edith Gifford, Maman Cochet, and Souvenir de S. A. Prince were good amongst the Teas; H.T. Caroline Testout was carrying some grand blooms, and Viscountess Folkestone, in a round bed, was making a brave show.

Protection, in the shape of bracken, has to be provided in winter, otherwise casualties would be frequent, as the climatic conditions in these hills are none too favourable. With this aid several of the varieties are, as a rule, cut to the ground line in winter, but generally break into strong growth in spring.—WANDERER.

### The Rose Name Gruss an Teplitz.

There has been a somewhat interesting discussion in certain foreign horticultural papers concerning the name of this Rose. To the purely English people the name has a harsh and crude tone, which is entirely foreign to the generality of Rose names. We have been so accustomed to associating the Rose with the musical French and English names, or with names in which there is some delicate sentiment, that the saddling of the flower with a mixture of rash and harsh tones, such as is made by the jumbling of g, r, s, t, and z, has caused some comment. It was stated by one connoisseur that the Rose was incorrectly named, and that it should properly be Gruss aus Teplitz, signifying a greeting from the city of Teplitz, and, in fact, it does so appear in one European trade catalogue. The truth of the thing, however, is (says "American Gardening") that the name as generally given is the correct one. The raiser of the Rose in question, formerly associated with the city of Teplitz, has now removed therefrom, named his novelty as a compliment to the city of his affections, and the flower thus becomes a greeting to the city.—"Gruss an Teplitz."

### Roses at Broughty Ferry.

The monthly meeting of the Broughty Ferry (Forfar) Horticultural Association was held on July 15, Mr. William Grant, president, in the chair. At the exhibition of Roses Messrs. Croll, Dalhousie Nurseries, were the chief exhibitors, their specimens of various kinds being really high-class. Messrs. Storrie, Dundee, also had many fine blooms forward, the collection being further enhanced by the exhibits of several gardeners. Mr. James Simpson, Dalhousie Nurseries, gave an address on "Roses," in which he imparted much information; both historical and cultural, on the favourite flowers. In the course of his remarks, he maintained that Scotland more than held its own in Rose culture, and in no district were they grown better than in our own. He had seen Roses exhibited in Germany, and in the Royal Gardens there, but they were inferior to those to be seen in Britain. Discussion followed, and Mr. Simpson and the exhibitors were accorded hearty votes of thanks, on the motion of Messrs. Barker and Slater respectively.

### Roses for English Gardens.\*

Considering how great is the utility of the Rose from many points of view, it is not surprising that the number of books dealing with Roses is steadily augmented, but rather that additions to Rose literature in book form do not appear oftener than they do. It is so convenient, even if there is nothing fresh about it, to have a compilation at hand such as this book furnishes for ready reference.

On pages 28 and 29 Miss Jekyll says of this book that it "is for the amateur, and deals with the subject from the point of view of garden observation and garden enjoyment."

It is a book which tells what are the best of the Roses in their many sections for the primary purpose of making the garden what it is intended to be, namely, a lovely place full of the most beautiful flowers which are disposed and harmonised to the very best advantage.

After briefly discussing the better varieties in the chapters devoted to them, the lady author appends lists which afford a further selection. Thus we have the New Roses discussed, and these form a chapter, and selections follow; then there are the species of Roses for garden uses, and the same rule is adhered to—the discussion first, then the lists.

Naturally enough the pergola, with arches, pillars, and screens, are considered from all points of view, or rather we should say that Roses for them are. It is only necessary to state that over 190 illustrations are included in this publication, to convey an idea of how liberal a share in the work of guidance and demonstration is effected by their assistance.

Everyone of the illustrations are from half-tone blocks of photographs and wash-drawings, and each occupy a page. The illustrations of pillar Roses are excellent, but many of the others are too dark to be of much use as a guide to the floriferousness or other character of the Roses portrayed.

Mr. Edward Mawley is author of Part II. of the book, and some of his chapters are on planting, pruning, propagating, exhibiting, and other practical work in Rose culture. He also discusses the enemies of the Rose, and the under-glass treatment of the plant. Lastly, he contributes "Some lists of the best Roses for various uses," which are very select indeed, and include the newest of the new, but all are of prime merit. With Mr. Mawley's chapters added, the book may admirably serve as a Rose manual to all who can indulge their tastes in this lovely flower. (Pp. 166, with index. 9 x 5½.)

# NOTES & NOTICES

## Scottish Award.

At a meeting of the council of the Royal Caledonian Horticultural Society held on July 16, the Neill prize was awarded to Mr. David Murray, gardener to the Marquis of Ailsa, Culzean Castle, Ayrshire, who has been a most successful grower both of fruits and vegetables.

## Cactus Dahlia Mrs. F. A. Perkins.

This lovely variety was greatly admired at the exhibitions last autumn. It is really one of the few gains of its season, and I find it is to be introduced this spring. The colouring is so charming! It is yellow, fading to the points of the florets to white, so that it has the appearance of being tipped. The shape of the flower, too, is elegance itself; of true Cactus form, and, if not gigantic, is large enough. A distinct and pretty thing like this will find favour among all lovers of these easily-grown and satisfactory flowers. It is safe to recommend that it be added to the smallest collections.—H.

## Horticultural Teaching.

The technical education system of the county councils is everywhere planting centres of training in every branch of agriculture and horticulture, and making them available at merely nominal cost. Residential schools have been established, with farm lands, dairies and gardens attached. The movement for the teaching of gardening to children in elementary schools has made great progress. During 1900 110 schools claimed the grant on 1,545 boys, of whom 1,098 received the full grant of 4s. as having put in their full forty-eight hours gardening, and 447 took the 2s. grant as having put in over twenty hours, but under the requisite forty. In 1895 only one school claimed the grant. In addition to the schools securing this grant from the Board of Education a large number of schools are taking up the matter for its interest-awakening value.

## Scottish Arboriculturists Visiting Sweden.

The Royal Scottish Arboricultural Society held a meeting at 5, St. Andrew Square, Edinburgh, on July 18, over which the Earl of Mansfield presided. The report by the judges on essays received in competition was to the effect that the medals had been gained by the following:—"The Forests of the Basses Pyrenees," George Cadell, late Indian Forestry Department, 1, Whitehall Gardens, S.W.; "The Erection and Maintenance of a Sawmill," W. M. Mitchell, forester, Gort, County Galway; "Report on the Plantations of an Estate," James Rodger, forester, Morton Hall Estate, Ringland, Norwich; "Creosoting Timber for Estate Purposes," George Leven, Auchincruive, Ayr; and "The Propagation of Forest Trees and Shrubs," Gilbert Brown, assistant forester, Scone, Stormonthfield, Perth. Reporting on the forestry exhibits at the Highland and Agricultural Society's Show, Mr. D. P. Laird said they must congratulate themselves on its success. Compared with that at Inverness, it was 50 per cent. better. They hoped that in years to come that section would go on improving. The meeting lasted a little over a quarter-of an hour. At 11.5 the party left the Waverley Station for Granton, there to embark for Sweden on the s.s. Balder. Among those who are taking part in the trip to Sweden are the following:—The Earl of Mansfield, president; Mr. R. C. Munro-Ferguson, M.P., hon. secretary; Sir Aach. Buchan-Hepburn of Smeaton Hepburn; Sir Leonard Leyall of Kinnaldy; Colonel Porteous, Kinross; the Rev. D. C. Stewart, Currie; and Mr. R. Galloway, the secretary. The excursionists arrived in Gothenburg on Sunday the 20th. Up till Thursday, August 31, they tour round places of interest. —On Thursday, July 24, they visit the Royal Palace at Stockholm, and on the following day a visit will be made to King Oscar's summer place at Drottningholm. On Tuesday, July 29, the party travel to Falun, the capital of Dalecarlia, which is perhaps the richest Pine region in Europe. The return journey will be made from Gothenburg on Friday, August 1, by the s.s. Bele.

## Appointment.

Mr. Daniel Betts as head gardener to the Lord Bishop of Exeter, in succession to Mr. T. Munday.

## The Queen's Cottage at Kew.

Mr. John Ellis (Notts, Rushcliffe), last week in the House of Commons, asked the First Commissioner of Works whether the public now had access to the Queen's cottage grounds in Kew Gardens; whether the gates had been unlocked; and whether the grounds had been thrown open again to the public, in accordance with the permission given by Her late Majesty. Mr. Akers-Douglas (Kent, St. Augustine's).—The answer is in the affirmative.

## Women in Horticulture.

The fourth founder's day of the hostel for women students in horticulture and the lighter branches of agriculture, founded by the Countess of Warwick in 1898, was celebrated the other day at Reading in charming weather, and in the presence of a large and distinguished company, including the Countess of Warwick, who has quite recovered from her recent indisposition, and her daughter, Lady Marjorie Greville. The Countess of Warwick in opening an interesting exhibition of flowers, fruit, dairy produce, and poultry, said that the work was going forward steadily and was prospering, and new posts and new professions were being opened up for the vast army of educated women who were making for themselves a distinct place in the world by thoroughness in training and the keenness with which they had undertaken what was but a few years ago pioneer work. Cordial thanks were due to the principal of Reading College, Mr. Mackinder, and all his staff for their great assistance in the past. That association for theoretical training was now severed, and she felt the grave responsibility of managing entirely by herself such an important work as the hostel had grown to be. But as no one seemed inclined to help her she intended to persevere year by year. The annual report submitted by the warden, Miss Bradley, showed gratifying progress in all departments. Mrs. Clare Fitzgibbon, of Toronto, secretary for the Dominion of Canada Women's Agricultural and Horticultural International Union, made an earnest appeal to English women to thoroughly learn such subjects as were taught at Reading, and then to make their way to Canada where a splendid future awaited all of them who had really qualified.

## Croydon Horticultural Mutual Improvement Society.

A meeting was held in the society's room at the Sunflower Temperance Hotel, on Tuesday evening, July 15. Mr. W. J. Simpson presided, and Mr. M. E. Mills occupied the vice-chair. The subject for the evening was "Remarks upon the Microscopic Structure of Plants," by the hon. secretary, Mr. J. Gregory. The lecturer described the principal minute structure of Desmids, Algæ, Lichens, Mosses, Ferns, stems, leaves, and their appendages, fungi, pollen, &c. The remarks were illustrated by a number of microscopic slides prepared by Mr. Gregory, and shown under microscopes on the table. The lecture was of considerable interest and practical use to the members. A brief discussion followed, and on the proposition of Mr. E. Kromer, seconded by Mr. Terry, a hearty vote of thanks was accorded the lecturer. The following programme of meetings to be held in the society's room at the Sunflower Temperance Hotel, George Street, Croydon, has been prepared: Aug. 19.—"Cultivation of Strawberries, Inside and Out," by Mr. J. Lyne, The Gardens, Foxbury, Chislehurst. September 2.—"Discussion on Birds of the Garden," by Mr. P. F. Bunyard, hon. treasurer. September 16.—"Violas," by Mr. G. Dray, superintendent, the Recreation Grounds, Sydenham. October 7.—"The Renovation of Old Fruit Trees," by Mr. T. Neve, The Gardens, Lindesham House, Wokingham. October 21.—"How to make an Alpine Garden." Illustrated; by Mr. E. Lovett, West Burton House, Addiscombe. November 4.—Discussion night. November 18.—"How Plants Grow," by Mr. H. O. Etherington, manager, J. R. Box's Nurseries, West Wickham. December 2.—"Stove and Greenhouse Ferns," by Mr. Dyson, Fern grower to J. Hill and Son, Lower Edmonton. December 16.—"Insectivorous Plants," by Dr. Brook Ridley, Widmore, Sydenham Road.

**Corydalis thalictrifolia.**

This is a new Chinese species, which would seem to be almost, if not quite hardy. A plant of it is growing well in the Rock Garden at Kew, but Messrs. J. Veitch and Sons, Ltd., who staged it in quantity at a recent meeting of the Royal Horticultural Society in the Drill Hall, and received an award of merit, grow it in pots. Perhaps, however, they did so only for that occasion. The large flowers are deep yellow and about the size shown in our illustration on another page. The sketch there presented also shows the foliage. Being free-flowering and showy, it is likely to become popular.

**Herbaceous Calceolarias.**

There will always be lovers of these flowers in evidence, and as cultivators they are second to none in the devotion they bestow on their special favourites. The collection which we figure on page 87, was grown by Mr. Edwin Broadey, The Gardens, Hooten Grange, near Chester, the seeds being procured from Mr. Henry Middlehurst, seedsman, Liverpool. The group represents a very fine strain, and some of the flowers, he tells us, measured 2½ in across, while a few of the plants were 2½ ft to 3 ft through. Mr. Broadey adds that they were greatly admired by numerous visitors. Perhaps our correspondent might be induced to describe his successful method of culture through the columns of the Journal.

**Effect of Cold on Plant Oils.**

Oils of Chamomile, Rosemary, Cumin, *Illicium anisatum* and Rose are found by Dubois to phosphoresce in the cold on agitation with an alcoholic solution of potassium hydrate. The different behaviour of oils of Geranium and Pelargonium gives an easy means of recognising substitutions of these oils for oil of Rose. Turpentine oil does not phosphoresce when fresh, but sometimes does so when old. The most brilliant effect is shown by *æsculin*, a glucoside of Horse Chestnut bark. In the cold alcoholic solution of potassium hydrate this substance sparkles for hours, brightening up with every movement of the liquid, and giving an intensity of light in direct proportion to the purity of the *æsculin*. In no case, however, is this phosphorescence equal to that of cultures of marine photo-bacteria.

**Plants at Barmouth.**

A few years ago, Major Best, Lingfield, brought from Mentone a plant of *Mesembryanthemum truncatum*. It is a plant that does not usually stand the English winter, but when the plant found that it had been transplanted in a country like Wales which can boast of *Llanfairpwllgwyngyllgogerychwyrndrobwlllandysiliogogogoch*, it having a crack jaw name itself, at once felt quite at home, grew luxuriantly, flowers freely, and has stood several winters at Barmouth quite unprotected. Mr. T. Lewis of Messrs. Clibran's says that for covering bare patches of rock or exposed dry positions such as abound at Barmouth nothing can be more suitable than the *Mesembryanthemum truncatum*. Another plant which grows and flowers profusely at Barmouth is the *Centranthus ruber* or the red Valerian. The bank facing Porkington Terrace has been simply gorgeous in its red Valerian dress this season. The spread of the plant is not due to human effort, but to the distribution of the seeds by wind, birds, and insects.

**Misuse of Coal.**

"So far back as 1882, the discovery was made by Sir D. Brandis and myself that the Eucalyptus planted on tropical mountains will produce fuel at the rate of twenty tons (dry-weight at 60 lb per cubic foot) per acre per year in perpetuity. The Eucalyptus plantation reproduces itself when cut without further expense, and its dry timber (which as met with commercially weighs 50 lb to 52 lb the cubic foot) has an equal, or a higher thermal power, bulk for bulk, than coal. We obtained this result as the maximum yield of *Eucalyptus globulus* on the Nilgiris, Southern India. . . . If a chance tree on a chance mountain in a chance soil can produce the equivalent of twenty tons of coal per acre per year, it seems not unreasonable to suppose that by selection we can produce, say, double this, or forty tons. To produce this in perpetuity, we should probably have to find a tree with the moderate soil of the Conifers, a powerful sun, a heavy rainfall, and a very rapid forced growth would be the essentials of such a production of wood fuel."—(From "Nature," July 10, 1902.)

**Heliconia vinosa.**

On another page we illustrate a broad-leaved and handsome species of *Heliconia*, one perhaps but little known. The leaves are large, and broadly oblong, quite 1 ft, or even 1½ ft long, bright green on the upper surface, and purplish beneath; the top surface, too, is ridged. As a stove plant we see no reason why it should not be more freely grown, being quite as ornamental as most of the other species, and comparing well with any of the Marantas.

**The Use of Architectural Features in Gardens.**

Now that "wild gardening" and that more negligent, though withal beautiful, style of gardening which sees its perfection in wide swathes of bright flowers "naturalised" in their surroundings has so largely become the vogue and is leading others to adopt it, there seems a danger of losing the placid dignity which characterised old English gardens. Not that we ever desire a return of the type of garden which prevailed in the days of Loudon and Wise, but we have no desire, on the other hand, to abolish everything that is "stiff and formal" from the garden design. Who, with good judgment and a knowledge of the beautiful in art and nature, will say that the formal walk and placid pool confined within the straight-lined balustrade, as shown on page 83, does not command admiration, and gives the impression of dignity and strength to the surroundings? Properly executed, architecture should help certain scenes in the garden, and it is not at all incompatible, as some suppose, to introduce ornamental masonry with improving effect to the garden plan. The landscape gardener is not, or ought not to be, merely a person who groups shrubs and trees advantageously or introduces the water element effectively in scenery; he is largely an architect as well, and it is quite within his province to prepare designs for such a feature as that on page 83. The confusion arises in these days from the fact that a large number of nobodies take upon themselves the name and pretensions of a fully-equipped landscape gardener without having the power to advise on any line but the solitary one which they employ in all cases.

**The Gardens at Hatfield.**

A grand garden party was given at Hatfield House on Saturday, the 19th inst. Hatfield's ancient Oaks have looked down on many a notable gathering of leading men and women since the first Earl of Salisbury built the stately home which is now the glory of the Cecils, but seldom have their rugged branches overshadowed a more brilliant assemblage than that which gathered on the terraces. The reception over, the many visitors moved about the grounds, talked with their friends, listened to the music of the bands of the Grenadier Guards and the Royal Engineers, who performed, one in the eastern and the other in the western gardens, or admired the beauty of the flowers. Evelyn spoke of Hatfield "garden and vineyard" as being "rarely well watered and planted," while Pepys says of the gardens that they were "such as I never saw in all my life; nor so good flowers, nor so great Gooseberries, as big as Nutmegs." The Hatfield vineyard is a vineyard no longer, and there were no great Gooseberries visible on Saturday, but the gardens are still "rarely well" planted and the flowers still "good. There is a rosery on the eastern side of those famous stables which once formed part of the Palace in which both Edward VI. and Elizabeth resided under guardianship, and here, though the first glory of the Roses is over for this year, many fine specimens of the queen of flowers were to be seen. Close by, in the square garden whose most noticeable feature in its Lime tree walks, there is such a collection of flowers in various tints of blue—Monkshoods, Delphiniums, and Lupins—as must have gladdened the heart of any "herbaceous perennial" enthusiast who may have wandered thither. On the other side of the house, just beyond the old maze, is a walk overarched with Banksian Crimson Rambler, and other climbing Roses, and near it lies an old-fashioned enclosed garden whose principal features are its great clumps of Lavender and its China and other Roses. The well-known Hybrid Tea Rose Marquis de Salisbury, whose petals when at their best seem to be composed of the richest scarlet velvet, and the less familiar Lady Cranborne, a pretty pink and white cluster Rose, are here growing appropriately almost side by side.

## Devon Gardeners' Outing.

Each year the Devon and Exeter Gardeners' Association enjoy an annual trip, and their latest was held last week, under the arrangements of the indefatigable hon. secretary (Mr. Andrew Hope), the genial hon. treasurer (Mr. Wallace Mackay), and the committee. The party, which included some friends, numbered about sixty, and assembling at St. David's Station, Exeter, journeyed to Totnes. Arrived later at Greenway, a landing was made at the private pier for the purpose of inspecting, by invitation, the extensive and well-arranged grounds of Mr. T. Bedford Bolitho's magnificent seat. The experts of the party were, of course, deeply interested and much admired the many rare delights on this beautiful estate, some of which are probably quite unique as specimens of arboriculture. The Blue Gum trees were notable, some of them have been imported from Mr. Bolitho's Cornish seat at Penzance, and the salubrious

*Heliconia vinosa.* (See page 78).

climate of the river Dart seems to be as congenial to their habit as to that of their original home. Here were Blue Gum trees from 20 to 30 feet high, an unusually fine specimen of the Tulip Tree, bearing its golden yellow blossoms, the New Zealand Flax just bursting into bloom, while the Pittosporum seemed to be entirely at home. Few of the gardeners present had ever seen these so well developed, the foliage being of beautifully crisped olive green. There is a luxuriance of blossom on the parterres, and Roses ramble at will on the jutting rocks and tree trunks, forming a picture to marvel at, while the conservatories contain a wealth of flowering Pelargoniums, Begonias, and other hothouse plants. In the flower gardens and kitchen gardens there was evidence of the expert's skill and care. There were abundant crops of Figs and other fruits, rows of Sweet Peas 10 feet high, and many herbaceous plants in full bloom. Taking a winding path through the woods belonging to the estate, some beautiful views of the entrance to Dartmouth harbour were had. Rejoining the boat the party steamed down to Kingswear, where they were met by Mr. Allen, head gardener to Mr. R. F. Wilkins, of Brookhill, who conducted them to this charming retreat. There was a couple of hours' stroll, and then the return to home.

## Commercial Floriculture in Italy.

Mr. Peter Crovetto, who has spent several years in American commercial floriculture, and is now located in Chiavari, Italy, writes to a friend in Tewkesbury, Mass., so entertainingly of what he has observed in that distant country that we ("The American Florist") have obtained permission to publish the following abstract of his letter:—

"The principal flowers here are Roses, which are grown as are Currants and similar stock in America. In summer they get rested naturally by the dry spell, often of five, six, or seven months' duration. From the latter part of August until October 20 they are carefully pruned, cultivated and mulched. The first rain generally comes in September, and after that they start to grow as though spring was approaching. The first flowers come in November, but the full crop is generally between December 1 and January 15, when the Bordighera, Nice and Cannes Roses come in full blaze and last until the 1st of March, after which the flowers are generally poor, but by that time so many bulbs are flowering that the Roses are not missed.

"Next in importance to the Rose and Camellia are the Carnations. These are planted out in like manner, but they being very particular about soil, and it being next to impossible to obtain sod here, we must work the soil to a depth of more than 3ft to turn up the deep subsoil, otherwise the plants get the stem-rot, fully 90 per cent. of them. The result of this hard work is that we get good Carnation plants, and the culture is much the same as in America when grown in the field. All colours are grown, the scarcest being good pink sorts. Every flower bursts the calyx, but the blooms are so nice and large and so double that the bursting is hardly noticeable.

"I have several American varieties, and the most of them burst also, but on account of their long calyxes these flowers are useless, while ours are short in calyx, and when open hold the petals well together without appearing ragged. Flora Hill splits 80 per cent., Crocker 50, White Cloud 50, Maceo 30, and Joost bursts but seldom. Crane is too single and light in colour. Crocker is fine in colour, form and tissue, and is much liked. Over here nobody thinks of disbudding Carnations. The blooms are picked short and all the buds allowed to come along, as was done in America twelve or fifteen years ago.

"We have, besides, one class of Carnations, different from all the others called the 'Big Carnations.' They are fully 5in to 7in in diameter, and notwithstanding

that they are all bursters, I think they could be made to pay in America, for the colours are very fine, and they are preferred to anything else by American or English travellers. They are grown by but a few of the best growers, for they are difficult and require much care. They bloom all winter alongside the American varieties. They are grown in 7in pots and kept well staked.

"Camellias are grown here very extensively. They are shipped all over Germany, North Italy, Switzerland, Austria, and largely in Russia, for they have the quality of lasting twelve or fifteen days. Stocks are a staple, very fine, in all shades but mostly white and pink, also Daffodils, many Anemones, Daisies, the large white and yellow ones; Callas and Gladioli. Freesia is simply a weed, but all of the yellow variety. Acacia is a stand-by crop, and is sold by tons. We have Acacias 15ft to 50ft high, in many species, such as *sempervirens*, *dealbata*, *cultriformis*, *microphylla*, *floribunda*, and six or eight others. Violets are abundant, and much cheaper than in America.

"Chrysanthemums are grown by everybody, but few grow them well. Last October at the Geneva exhibition many very large and beautiful blooms were shown, but only by four or five growers out of the very many hundreds who grow flowers at Geneva. I have planted 3,000 Chrysanthemums, and have more to plant yet,

and my brother will plant about as many. Of these 750 are Modesto, 550 Hill, our best early pink; 550 Robinson, 550 Soleil d'Octobre, 200 Carnot, 200 Warren, 150 Niveus, and about fifteen other varieties. We are short on late and middle season pink.

"I have tried three years to sell Sweet Peas. The people here say Peas are only for eating! They grow and bloom splendidly but cannot be sold. A lot of annuals are grown here, such as Candytuft, Gypsophila, Mignonette, Myosotis, and so forth, also Cyclamens, Ericas, Gardenias, and Epacris, all outside. A Geranium when planted in the garden is there for all time, and a Heliotrope will last for fifty years.

"One of my brothers has planted 15,000 *Clivia miniata* of the finest strain; he sends the blooms to Berlin. We are very anxious now about the new tariff that Kaiser William wants to put on flowers, and mad with our rotten railway."

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### A Day in Kent.

The position of Kent as a county, and the nature of its features, together with the fertility of its soil, have contributed to its past and present distinction as a great garden and fruit nursery. It is south of London, while north and east the unending sea, the highway for the ships of the world, washes its boundaries. The chalky Downs of Kent are apparent to the Continental stranger while yet he is far off, and Dover is his land-mark. This was the route in the time of the Normans, and is the line of passage to-day. The sunshine and the soil in Kent afford pre-eminence to the culture of Apples, Plums, Cherries, Pears, Gooseberries, Strawberries, Raspberries, Currants, and Hops, and foolish indeed would Kentish men be to neglect these blessings of Providence.

Since Mr. Gladstone urged the culture of fruit, and particularly of Strawberries, as a counteraction to the agricultural depression, thousands of acres have been laid down, with the result that a year of plenteousness is a year of loss indeed to the fruit-growers, and Mr. Henry Cannell said to me one day last week, "You have only to mention Strawberries up there"—pointing to a farm—"to be knocked down." He gave me a paper in which I find the following paragraph, entitled a—

#### "GLUT IN STRAWBERRIES."

"A few weeks ago, when we had a succession of rain, hail, and frost, it was generally anticipated that this would be a bad fruit year, and that there would be a great scarcity of Strawberries. The altered climatic conditions, however, suddenly changed the whole outlook, and the season now promises to be memorable for the large crops of the 'king of fruits.' The London markets have been completely glutted this week by the heavy consignments of this luscious fruit, and the result has been that no higher price than 1s. 6d. a peck is obtainable. On Monday, July 14, in Mr. E. Vinson's fields, near Swanley, no less than 3,000 pecks of Strawberries were picked, being a record gathering on his farm, and before breakfast on Tuesday morning 1,200 peck baskets had been filled by the pickers. On Monday, at Bexley Railway Station, thirteen truck loads of the fruit were despatched to London, and every day the roads between the Swanley district and London have been crowded night and day with vehicles, including motor waggons, bearing their freights of Strawberries for the Metropolis."

The same story was applicable to Hampshire, and we noted the price of Strawberries at 2d. per lb on the costers' barrows in Fleet Street. The effect of such quantities of Strawberries filling the markets is to cause a slump in prices. The result of that, again, may be that growers will plant fewer acres, until in ordinary years prices are profitable all the way through for them. They may even plant less than the demand would require, and prices for fresh fruits would then rise high even with good weather. In the Coffee industry abroad there is a constant see-saw in production. The Coffee plants require seven or eight years to become fruitful from the time of planting. Large plantations having been made owing to the high prices obtainable at one time, the production of Coffee beans became greater than the demand, and prices fell; growers refused to plant; but again in three or four years a strong upward tendency became apparent, and with the rise in returns, the growers again plant "not wisely, but too well," and sooner or later another dip occurs. Statistics over thirty or forty years show regular rises and falls in the output in Coffee, solely owing to this cause.

#### Motor Cars are Used.

It is interesting to note the fact that Messrs. Wood, the great fruit farmers, who have 500,000 acres under their charge, are now employing motor cars, which draw eight tons of produce into Covent Garden Market on each journey. Other growers will assuredly follow suit. The same firm are able to employ steam ploughs for tillage, and as they have a little foundry of their

own, and capable artisans, the whole of the necessary repairs in connection with their numerous vans, carts, waggons, as well as horse-shoeing, &c., can be accomplished expeditiously, and at the least cost, under their own supervision. There are a number of brothers in the business, and the telephone connects all the branches of the great farm. The state and needs of the London and other great markets being telegraphed to the central quarters, he in command there at once telephones right and left to the branch offices on the estate, and boys commit the orders to the "gangers" in the fields. Then there is stir among the pickers and gatherers. Each is supplied with a check, for piecework is the rule everywhere—so much per peck of fruit gathered. On delivering this check, another is given in exchange and the amount of fruit just handed in is put to the picker's credit in a book kept by the foreman. Formerly each packer was paid daily, the paymaster visiting the different fields late in the afternoon on horse-back or in a dog-cart, but now I believe that weekly payments are the rule.

#### Kentish Fruit Pickers.

The pickers are nearly all from the slums of London, a ragged, unkempt crowd. A description of the worst of them would best suit the pages of "Punch" or "Judy," yet they are looked upon by the farmers as their great salvation. Labour of the usual stamp cannot, absolutely cannot, be got unless at unspeakable wages, but these poor, shiftless wretches from the dingy courts and alleys flock down to Kent at the beginning of every summer, and linger on till the Hops are all gleaned in September. Many of them journey back to the East End on a Saturday in the dirtiest and plainest of railway carriages, each carriage choked full with men, women, children, old-clothes, and beer and whisky bottles. To see them arrive at London Bridge is a sight to wonder at, and never to be forgotten.

#### The Season's Crops.

From what I learned of Kent crops in general, the season promises to be thoroughly satisfactory. Currants are all good, Raspberries are also ripe now, and in a fortnight the Early Rivers Plums will come into season; and Cherries are heavy so far as one could see. Very few of the old-fashioned grass orchards are now remaining, though full many an acre still runs wild, yielding old Gerarde's Traveller's Joy (*Clematis vitalba*) and little else. It is a matter for comment, too, that the hedges surrounding the orchards are so overgrown and untrimmed as they are. I yield to none in my admiration for the exceeding beauty and interest of these rural hedgerows with their ferny and flowery lanes, but where they affect the utilitarian aspect, as in the cultivated parts of Kent, I confess my judgment goes against them. They may, or they may not, harbour insects and fungi, but they certainly do shade much of the land and crops. On the grounds of shelter, not half of them are required, and even then a less height and breadth would surely suffice. It is a welcome sight, however, to notice the many renewed Apple orchards, with splendidly formed young trees. These are not summer pruned, but they are gone over every winter and trimmed into shape and fruitfulness. Damson and Plum trees are short-lived, and require to be oftener uprooted. Gooseberries are mostly grown beneath the taller trees.

#### Breezy Eynsford.

The seed grounds of Messrs. Cannell and Sons are two and a half miles south from Swanley, and a brief evening visit was paid after having been at the home nursery and over to the college. How hard and dry the soil seemed after the storms and the baking sunrays which followed. Truth it was that the ground was hard, but not so dry, even though the lands slope face to face and form a broad and long valley. It is here that the Clarkias nod and the great red Peppies cast their flaring petals. But one must needs calm down, and it suffices for this wandering scribe to name sedately those varieties of annual flowers whose excellencies gave them distinction in these grounds.

The grace of the Clarkias is proverbial, and *C. pulchella alba*, with flowers of absolute whiteness; *Clarkia elegans* Mrs. Langtry, a rich deep mauve; *C. pulchella fl.-pl.*, rosy and double flowered, and *C. Salmon Queen*, one of the most beautiful of all annuals, come to mind. They are all worthy of their place.

*Nemesia strumosa*, in all colours of the rainbow except the blues, though "miffy" growers, at the same time always produce a gorgeously brilliant inflorescence. This is one of the finest annuals recently brought to the front. *Cosmos bipinnata alba* is grown largely because of its exceedingly graceful mien, having finely pinnately dissected green foliage. A *Tropæolum* (*Nasturtium*) briefly named "Scarlet," presented a dazzling show, and the *Papaver caryophylloides*, a double Carnation-flowered form, 2ft high, bears handsome flowers coloured rose and white. For the edges of a shrubbery it commends itself. *Tropæolum Empress of India* should have been mentioned. It bears rich crimson flowers, and has dark foliage.

Another little gem when seen at its best is *Verbena ericoides alba*, which is largely grown both in the north and the south. As a bee-flower it has few equals, and is dwarf enough for edging purposes. *Linum grandiflorum rubrum* and *Centaurea maritima*

require no praise, neither do the selected strains of Shirley Poppies, or Verbenas which are now offered. A deep purple Candytuft, unnamed, was especially distinctive, and the handsome Larkspurs in many blue and violet-purple hues stood out prominently and well. And lastly (for my visit here was brief) I would bring to the notice of any who have not seen it, a variety of *Antirrhinum majus*, named *nigrans*, with long and stout racemes of noble amaranth-crimson flowers. This, with *A. m. Youngi*, deep amaranth, are two border plants of rare merit. *Geranium platypetalum* is cultivated in quantity for its foliage, which changes to crimson in autumn. Sweet Peas and hardy herbaceous flowers, with culinary Peas, and a splendid array of the different vegetables for seeds, completed the subjects seen in this survey of Eynsford. The stay would have been prolonged, but the hands of the clock pointed the hour of my train's arrival, and a sharp drive to the station just brought me there in time.—

#### Zonal Pelargoniums.

Every gardener understands the value of Zonal Pelargoniums for the production and supply of cut flowers during the winter months. In the following lines I name a number of varieties whose merits have not previously been made known, and of each of which the very highest praise can be given. They are mostly *M. Bruant's* novelties, but Messrs. Cannell and Sons have now a goodly stock of them. In doubles we have *Captain Flayelle*, after the habit of King of Denmark, known and appreciated for its robustness of growth. This habit or character has been imparted to a large number of the later varieties, and ample, healthy leafage is not objected to.

Another of the finest is *M. Anatole Roseleur*, an excellent rose-pink variety with large semi-double flowers. *Tresor* is salmon, striped with a lighter shade of the same colour, and is also good. Again in salmon shade we have *Madelaine Lemaire*, which is really blush-salmon, and carries flowers of an enormous size. *Olive Schreiner* is rich red at the edges, with almost a white centre, and is classed as a *Picotee*-edged sort. *Cousin Bele* is also salmon-blush, while *Le Colosse*, a semi-double, is a bright fiery scarlet. *Thomas Meehan* having gigantic flowers presents a deep crimson salmon tint. In *Transvaal* we have a very brilliant rosy-scarlet flower; and *Golden Glory* is the best of all the orange-scarlets. Lastly, I would name *Miss Ashworth*, which is spoken of as the finest double white.

Then there are a number of new and superior single Zonal Pelargoniums. *St. Cecilia* is a splendid salmon-rose; *Lady Roscoe* with the same tint as in peach-blossom is decidedly beautiful, and *Barbara Hope*, a good rich flesh-pink suffused with orange, is also outstanding. *T. E. Green* might be described as orange-scarlet, and is one of the most brilliant flowers of all. *Lady Brook* conveys a very delicate light pink and white; while *Mons. Calvat* is a handsome crimson; though old and well-known, one still finds the variety *H. Cannell, jun.*, with its dark crimson flowers, a prime favourite. Concluding the list we have an all-round Zonal in *King Edward VII.*, but whose great quality lies in brilliance and richness for bedding uses. It seems to be a sport reversion to the true deep blackish-crimson *Henry Jacoby*, which variety is so very much confused in collections nowadays. Seen on a sunny slope, the floriferous character and large trusses of *King Edward VII.* presented a rich and glorious effect.

#### Begonias and Cannas.

The strain of single and double Begonias included some wonderfully bright varieties, and among the species the little-known *B. Martiana* with bright rose-pink single flowers, borne on short stalks close to the fleshy erect stems, was indeed very beautiful. The Cannas from here are absolutely unexcelled, and batch after batch are to be seen "coming on" in rotation. The rootstocks are potted into 5in or 6in pots, never larger, and with only moderately firm packing of the soil. The great secret of their huge flower-spikes would seem to be in feeding, which is started so soon as the first appearances of a flower begin to show. They are grown on ash-covered stages, in low span-roofed houses, so that the foliage is quite close to the glass.

Cockscombs make a grand feature, and it is not often that a "comb" of 30in in circumference from one side to the other can be noted. Nor was this seen now, but Mr. Cannell's foreman vouches for it, and with him I leave the record.

The succulent house is at all times very interesting and unsurpassed in the richness of its variety. *Echeveria farinosa*, so pretty as an edging plant for dry places, struck me as being particularly desirable, and were I a gardener again, there are many of these strange looking plants which I would gather together into a collection.

Passing the bedding Lobelias in the open frames, the brightness of one or two attracted attention, and good Lobelias are always welcomed by him who has much bedding to do. *Swanley Blue* is deeply coloured yet very bright withal, and has a white eye. *King of the Blues* is indigo and richly toned, with a large white eye. *Beauty of Darmstadt* is a deep, glowing, gentian-blue, and has no white eye, or at least only a speck. The *Brighton*

*Blue* is a washed-out, poor colour, and is not commended. Is it hopeless to desire a yellow and a good red dwarf bedding Lobelia? The word "impossible" has at times lost the affix.

#### At the Horticultural College.

Under a heating sun, and on dusty roads, one cared little for the general scene on either side, on the way to the college. It was Prize Day there, the day of all the year for those who so bravely work and study at that interesting institution. Parents, brothers, sisters and friends had been invited to come and see what progress was being made, and after the prize distribution the whole company flocked out to the typical green and smooth shaven English lawn for tea, or iced drinks and fruit.

Sir John Cockburn, late Agent-General for South Australia, presented the prizes, and his geniality of countenance attracted special interest to his speeches. Sir Joshua Fitch, who presided, opened the proceedings by congratulating the governors of the Horticultural College on the steady progress which the institution was making, and one remarkable feature was the increase in the number of female students. During the reign of the late Queen various employments had been opened to ladies from which not so very long ago they were absolutely excluded. He was in favour of everything which opened honourable and lucrative occupations to women, and there was none for which they were more suited than gardening, and those who received proper education and training in that institution had no difficulty in obtaining employment. Gardening was a healthy and delightful occupation, and he strongly recommended all the students present to read Bacon's charming essay on gardens.

Sir John Cockburn said some of them might regard his presence there as an indication of the colonial invasion. He recommended them in their turn to invade the colonies, and assured them that any of those who had obtained a knowledge of gardening in that college would receive a cordial welcome in Australia. Sir John also said that one of the most satisfactory points of the college was the ease with which the lady students obtained lucrative employment, 90 per cent. of those who had passed last year having been successful in obtaining appointments as gardeners. Indeed, so successful have the ladies been in the examinations, including practical work in the garden, even down to mowing with scythes, that it has been decided to make the institution a women's college, exclusive of all men students.

Since the new range of glass houses was completed the garden has been greatly enhanced as a station for practical teaching. The north field lying to the back of the ranges, has been converted to an admirable vegetable garden, and I have certainly never seen the students' plots in better or brighter condition than they are this summer. The Rose garden, opened only two years ago, in the presence of Dean Hole, is in splendid vigour, and loads of fine flowers have rewarded the attentions of the student gardeners. This is all the more creditable considering that the soil is of a light and sandy character. A beautiful pergola, similar to the sixteenth century "galleries," has been erected for climbing Roses, and will add greatly to the beauty of the garden.

The new conservatories are filled with a miscellaneous collection of suitable plants, including *Hydrangea hortensis*, Ivy-leaved Pelargoniums, Cannas, Oleanders, Carnations, *Hedychium coronarium*, Begonias, Gloxinias, Abutilons, Eupatoriums, Schizanthus, Palms, and other subjects, including a specimen *Tropaeolum Fireball* on the roof, and the beautiful *Maurandya Barclayana* on a side wall, but it is hoped that even an improved selection will be got together in course of time. The houses are nicely arranged and well built, though the ventilating apparatus could have been improved.

In the other and older span-roofed houses there are excellent crops of Cucumbers, Tomatoes, Melons, and Grapes, each in highly creditable condition. Under the direction of Mr. H. Patterson, late of the Royal Gardens, Kew, the practical work has assumed a new and higher importance, and certainly it is a fact that the garden smiles more distinctly than it has ever done before. As the garden is to be devoted to women, and is under the management of a committee of the fair sex, the resident principal, a gentleman who has made himself much respected during his term of office at Swanley, terminates his period there on the last day of this month, and we wish him success in his new sphere of usefulness.—WANDERING WILLIE.

#### The Value of a Garden.

There would certainly be more loafers at Piccadilly Corner, more loungers in music halls, more dull-eyed fools hanging over tavern counters (says a daily paper) if there were no gardens in our suburbs. A man's home means to many a clerk his garden, and when the City clocks strike six, and all those black coats go swarming off to omnibus, railway, and tramway car, be sure some of that haste is magnetised by the little garden across the water where spring is just beginning to force an urban smile.

## An Evening with the Microscope.\*

Our subject this evening is one a little removed from the ordinary course of practical gardening; that is to say, it is not one on the cultivation of plants, fruit, or vegetables; but it is "An Evening with the Microscope," and, although this may appear to some a dry and uninteresting subject, I sincerely trust not one of you will return home without the satisfaction of having heard or knowing something you never knew before, and which may, to some extent, give you some satisfaction for your attendance here. A microscope is one of the most useful instruments that a gardener can possess, whether it be in the simple form of a single or treble pocket lens, or mounted on a brass stand and fitted up with numerous eye-pieces, objectives, &c., for higher magnifying powers and a greater field of study. By its use it reveals to him the presence or absence of many insect enemies that are totally obscure and undiscernible to the naked eye, and which, if allowed to establish themselves in quantity, would prove very injurious to plant life, and much more difficult to eradicate. It also enables him to examine valuable plants when in a sickly condition, to find out whether it is caused by dreaded fungus in various forms, or from other effects. To the botanist it is invaluable, as by its use he examines the structure of the growth of wood, shoots, stems, flowers, and foliage of plants, which enables him to classify them in their various orders, genera, and species, so as to ultimately discover whether the plant under examination is, or is not, recorded in botanical history.

The first microscope I ever saw was a small single pocket lens. When I was apprentice, the gardener was examining some Peach tree leaves that I had syringed the previous day with insecticide to kill red spider, and I was curious enough to ask permission to look through it, which favour was granted: at the same time I was informed that if I intended to be a gardener I must quickly get into possession of a similar instrument, and must also make myself thoroughly acquainted with insect enemies, and with botany. Outside the garden boundary was an enclosure for hay, which was gaily decorated with abundance of yellow flowers, and, as though I was a manufactured expert, he said, "Jim, what is the botanical name of those yellow flowers?" "Why, Dandelions!" said I. "No," said he, "it is *Taraxacum officinale*." I thought to myself if that is a botanical name, I don't want many of them; but, bucking up courage, I walked three miles to buy a pocket microscope, and, having fortified myself with a copy of Lindley's "School Botany," which was closely followed with a copy of Macgillivray's "British Wild Flowers" and Hooker's "British Flora," together with a botanist's collecting case, I soon felt myself in the enviable position of being a full-blown botanist—with everything to learn however!

After having acquired a certain amount of knowledge on the subject, as time went on I found there was an upheaval going on in the gardening world, and except in strictly botanical gardens the botanist had to give way to the gardener of decorative skill, and the prize-takers of flowers, plants, fruit, and vegetables. But a further change has taken place, and at the present time I think I am safe in saying that the gardener in most demand is that class of men that do the most for the least money, or who can plant a fruit tree overnight and find a crop of fruit on it the next morning. Can this be wondered at, considering the enormous amount of garden produce of all kinds imported into this country from all parts of the world at ridiculously low prices? We live in a fast age, when rapidity of transit, whether by locomotion or navigation, is the order of the day. Steam navigation and railways have revolutionised the world. Yet be not discouraged, gardeners have always been wanted, and have existed from the days of Adam to the present time, and that gardener who fortifies himself with the greatest amount of knowledge in readiness to occupy any position in life, botanical or otherwise, is the most likely man to secure a good position when it presents itself. When living in Scotland, I had a young man with me that imbibed the idea that he would like to acquire a knowledge of botany, so I asked him if he would remember the botanical name of Dandelion if I would tell him. He instantly assured me he would, and when I told him it was *Taraxacum officinale*, he replied, "Master, I could never remember that name; it is as long as the Caledonian Railway." Such are the general impressions of the young aspirant when a difficult task presents itself; but the youth with a determined mind invariably surmounts the difficulty; but I would here warn the ambitious man who yearns for a thorough knowledge of botany that to devote too much time to this study, and neglect

the other principal branches of the work; would be fatal to his prospects as a practical gardener. We are told by the Dean of Rochester in his "Book on Roses," page 125, "I never remember to have seen a scientific botanist and a successful practical florist under the same hat," &c., &c.

It is now desirable that we should make ourselves acquainted with the instrument in question, also its numerous parts, and the use of the same. I will therefore proceed to briefly describe them. The first of the kind I ever possessed was a pocket lens; but you will observe there are three lenses, each one giving increased magnifying powers, it is the instrument in common use with gardeners and botanists. In the ordinary way it is found amply sufficient for general purposes; but aspiring to higher class instruments for greater magnifying powers we find them of a very different construction. This is a binocular instrument, i.e., you can see the object exposed on the stage with both eyes at the same time. It was considered one of the best at the time it was made. This is the tripod stand, the feet being movable for the convenience of packing in small compass; this is the circular base to which the feet are secured. I may here say there is a little history attached to this instrument, which is vouched for by the inscription on it—viz., "Presented by the members of the Liverpool Naturalists' Field Club to the Rev. William Banister, M.A., in acknowledgment of his assiduous and successful exertions as honorary secretary, December, 1866." You will notice the base is in two portions, the upper swivels round for adjusting the instrument. This is the upright limb, with movable joint, for inclining it into any position. This is the principal limb that carries the body of the instrument; these two small milled heads and screws are for holding the side silver and glass reflectors; the larger milled heads, with pinion for rackwork underneath, is for quick adjustment when focussing. The body is supported by the strong limb. This milled head, with these racks and pinions, is for focussing the eye pieces, and this one at the lower end of the body is for very fine adjustments. These are the sliding sockets, worked by rack and pinion, for focussing the eye pieces, of which there are three pairs, with various magnifying powers. No. 1, the longest, is the lowest, and of the short ones, No. 3 has the highest power. They are fitted with sliding caps, and blackened to prevent any glare to the eyes when viewing the objects. This is an improved form of cap, sloped to fit over the eyes tightly, and effectually excludes the light or glare of lamp from the eyes when objects are being examined. This is a slot for the insertion of a micrometer for measuring objects. This one is fitted with a Quekett indicator for small objects. This is the draw tube to lengthen the limb as desired, more particularly to make an object fill up the whole of the field of view. It has a scale for recording the length of focus and to calculate the magnifying power; it is also used with the erecting glass and two-third object glass for extending or reducing the magnifying power without changing the object glass, more particularly for dissection and manipulating purposes.

You will notice one limb of the instrument looks direct to the object on the stage, and the other is fixed obliquely to it, so that it would seem impossible to see the object on the stage with the left eye, but this difficulty is overcome by the insertion of a small Wenham prism at the lower end of the body of the instrument, and is held in position by a small spring; thus the object on the stage is reflected up the left limb of the body, so that it can thus be distinctly seen with both eyes at the same time. This is a triple nose-piece, and is an invaluable acquisition to the microscopist, as by its use three objectives of various powers can be fixed on the instrument at once, and each objective swivel round to the field of view in a second, thus dispensing with the necessity of waiting to screw off and on each objective separately. Thus if the object can be seen to better advantage with a low power, or vice versa, they can be instantly applied to the object.

These are the objectives of various magnifying powers, the lowest being three inch, and the highest one-tenth of an inch. The approximate range of their powers is from about thirty to one thousand five hundred and over. Those I mostly use are the three inch, inch and a half, and two-thirds. There are many specimens that look most beautiful under the low powers, because they are not too much magnified to penetrate deeply into them, whereas if closer details of the subject under examination is desired the higher powers can be quickly swivelled into the field of view to obtain them.

This is the stage on which the objects for examination are placed or fixed by means of the springs provided for the purpose. The lower portion is fixed to the main limb, and has a circular hole in the centre of it to allow the transmitted light from below to pass to the object on the stage, whether it be from the mirror, Wenham's Parabola, Amici, or Nacet's prisms, or polarised light from Nicol's prisms. Into this fixed portion others are made to work in grooves by means of the milled heads, pinions, and rackwork, so that the object can be moved up or down, or from right to left, as desired; it also revolves, so that the object can

\* Paper read by Mr. J. Ollerhead at a meeting of the Wimbledon and District Gardeners' Mutual Improvement Society, February 17th, 1902. The subject being again brought forward on March 17th, after a discussion on Roses in pots.

be rotated. The upper portion is provided with a ledge at bottom, and a sliding fitting at the top, with springs for clamping the objects firm to the stage. It has also a socket at the corner for holding the forceps when in use.

Immediately under the stage is a grooved fitting with pinion and milled heads for carrying the sub-stage, and cylindrical fittings to receive all kinds of illuminating apparatus which are required below the stage. The stem tube is fixed to the lower part of the main limb for carrying the mirror and white cloud illuminator. This is the lengthening arm to mirror for giving oblique side illumination, and this the semi-circle in which the mirror swings. When using artificial light, it is very desirable to have a proper lamp that can easily be adjusted to various heights to suit transparent or opaque objects. This is one of Messrs. Becks, and is a very useful one; the shade intercepts the glaring light from the eyes of the observer.

For high power objectives that cannot be advantageously used with Lieberkuhns for opaque objects, Messrs. Beck have invented this patent illuminator, into which they have introduced a disc of thin glass attached to a milled head, and by rotating the same, any angle of light can be exactly adjusted. This appliance is introduced by a slot into the interior of an adapter between the objective and the nose-piece of the microscope. The light enters through the aperture, and is reflected downwards to the object beneath.

The camera lucida is a very useful appliance. The eye-piece of the microscope should be placed at an elevation of ten inches from the table, the object on the stage being properly focussed. The eye shade is removed and the camera slipped on in its place. A piece of white paper is then put on the table, and the iris of the eye should be in a position to see through the prism and also on to the paper. The result will be that the object under

**A Placid Effect in Garden Design.** (See page 78.)

There are several methods of condensing the light and throwing it more intensely from the lamp to the object under observation. Here is the bull's-eye condenser, one that is mostly used for concentrating the light from the mirror to the object on the stage. This is the small condensing lens for fitting on to the main limb of the instrument for the illumination of opaque or other objects from above, and the blue glass moderator is used to tone down the glare when too intense for the eyes. The silver side reflector is used with the bull's-eye, one on each side of the instrument, to reflect the light on both sides of subjects that are of an uneven nature, such as minerals, mounted as opaque objects, otherwise one side would be illuminated and the other side would be in the shade. The parabolic Lieberkuhn is used for a similar purpose: it slides on to the objectives. The ordinary Lieberkuhns also slide on to the objectives in the same way, but they reflect the light direct on to the object from above; and should the object be too transparent, then by fixing the dark wells in the sub-stage it will be seen on a beautiful dark ground,

observation will be reflected through the camera to the paper below, and can thus be clearly defined, traced or drawn by following the reflections. Thus minute objects can be drawn that could not otherwise be obtained.

(To be continued.)

#### The Moon and Thunderstorms.

A connection between thunderstorms and the moon's phases is now claimed by meteorologists. Some months ago a greater frequency of such storms at new moon than at full moon was noticed in the records at Greenwich for thirteen years, and from other inquiry it appears that Madrid observations for twenty years give similar evidence. The Spanish records show 29 per cent. of the thunderstorms near new moon, 22.8 near first quarter, 21.8 near full moon, and 26.4 near last quarter.

### Malcolm Dunn Memorial Fund.

It has now been arranged that the Royal Scottish Arboricultural Society is to retain the money collected by it in order to create a Dunn Memorial in connection with arboriculture. The Royal Caledonian Horticultural Society and the Scottish Horticultural Association have united the funds collected by each of them and have formed a "Malcolm Dunn Memorial in Horticulture." They have appointed trustees to carry out the purposes of the trust. These trustees are authorised to give prizes for the advancement and improvement of the science and practice of the culture or for the successful culture of plants, flowers, trees, fruits, and vegetables, or otherwise for the advancement and practice of horticulture, as the trustees shall think fit, and it is further directed that these prizes may be given through the medium of any horticultural society or association in Scotland. The trustees have appointed me their secretary and treasurer, and I shall be glad to answer any communications in connection with the trust.—P. MURRAY THOMSON.

### Destroying Red Spider on Vines.

In replying to Mr. A. Jefferies' criticism (on page 57), let me at once say that I have very little to add to that already advanced on page 24. I there stated clearly that it was seldom safe to vaporise Muscats with XL All compound sufficiently strong to kill red spider without also injuring the Vines, although I gave an instance in which I had done so successfully. I do not pretend to explain the mystery, and I was agreeably surprised myself at the time. On Black Hamburgs, however, I have frequently completely destroyed red spider solely by the aid of XL All, and I have no doubt others can do so too if they do not defer the attempt until the insects have become hardened depredators. To kill red spider I used XL All on the first night, at an additional half strength to that given on the bottle. On the leaves I examined the next day the young insects were quite dead, the older ones alive, but not in the least "frisky." The next evening the vaporiser was used at double strength, and although I examined a great many leaves, I saw no live insects, neither have I had trouble with them since. After Mr. Jefferies' statement that he found red spider alive on Croton leaves after having been vaporised at nearly fifty times the usual strength, I am inclined to think that the Essex species are decidedly more "hardened criminals" than have yet swooped down on the Midlands.—H. D.

### Plants in Scotland.

Permit me to agree with what has been said by "D. C." in the Journal, and also by yourself in the brief comment added, regarding the Scottish climate and the hardness of plants. There is no doubt that the climate of the great portion of our northern land has been unjustly maligned, and that many plants people are afraid to try in Scottish gardens will succeed quite well. We must not, however, accept the experience of Mr. Osgood H. Mackenzie, at Inverewe, in Ross-shire, as entirely representative. All along the coast it may be said that the climate is much milder than in the Midlands of England; but if we go further inland we shall find that the conditions more nearly resemble those in the English Midlands. From Wigtownshire north on the west coast there is a warm belt, and it seems even milder as we approach Argyle and go north. I am referring to the mildness as evidenced by plant life, not by meteorological returns alone. The east coast, too, is wonderfully mild, as may be seen even at Edinburgh. If, however, you go into some of the inland counties there is a great difference. I find that plants from the west of South America, such as those from Chili, for example, do remarkably well, and generally prove hardier near the coast in Scotland than in many English gardens.

I have had a good deal of correspondence with growers of such things, and this is what my observation, supplemented by other information, has led me to conclude. One place not mentioned is that of the late Lord Malcolm, at Poltalloch in Argyle, where many reputedly tender shrubs thrive and attain a great size. Taking, however, an inland belt up the centre of Scotland, quite different conditions will generally be found to prevail. All the same, Scotland is not the land of frost and snow so many in the south seem to imagine. I recollect leaving a London suburban station on my way to Scotland one cold, late winter, and the tone of commiseration with which the porter in charge of one's luggage said, "It will be very cold in Scotland, sir." He was entirely wrong, so far as regards my own district and many more.—S. ARNOTT, Carsethorn, Kirkcudbrightshire.

## Societies.

### Royal Horticultural—Drill Hall, July 22nd.

The exhibition of the National Carnation and Picotee Society (Southern Section) being held in conjunction with the fortnightly meeting of the Royal Horticultural Society on Tuesday last, the Drill Hall was largely occupied with competitive exhibits of Carnations. Messrs. Ray's Cherries and various groups of hardy flowers further aided the general display.

#### Orchid Committee.

Very few Orchids were shown, but a splendid *Grammangis Ellisi* bearing a strong raceme of over twenty flowers, each deeply tinged with the handsome brown shade which gives it distinction, was conspicuous. This received a cultural commendation, and came from H. F. Simond, Esq. (gardener, Mr. Geo. E. Day), Woodthorpe, Beckenham. A well-flowered plant of *Dendrobium Falconeri* was sent by W. C. Walker, Esq. (gardener, Mr. Geo. Cragg), Percy Lodge, Winchmore Hill. *Cattleya Wiganiana* var., with segments of quite a new colour, salmon-mauve and purple lip, from Sir F. Wigan, Bart. (grower, Mr. W. H. Young), Clara Lawn, East Sheen, received an F.C.C., and Baron Schröder had a fine *Cypripedium Antigone*, pale purplish. Messrs. J. Veitch and Sons, Ltd., Chelsea, S.W., contributed *Laelio-Cattleya Aphrodite alba*, with six large flowers; *Cypripedium* x W. R. Lee, very handsomely spotted; *Laelia* x Helen, mauve and fimbriated lip, brown petals and sepals; L.-C. x Norba and *Cattleya Atalanta*.

#### Fruit and Vegetable Committee.

Messrs. W. Ray and Co., Mount Pleasant Nursery, Teynham, Kent, staged about thirty plates of Cherries, amongst which much fine fruit was shown. Black Heart, Amber Heart, Noble, Napoleon, Bigarreau, were amongst the best seen, and some branches covered with fruit, showed the vigour well. About twenty-five varieties were noticed.

Messrs. T. Rivers and Son, Sawbridgeworth, sent a good box of Duke of York Peach, from pot trees in cold house; the fruit was well coloured and even in size.

Messrs. James Veitch and Sons, Chelsea, sent the new Strawberry, Khedive, a cross between Lord Suffield and British Queen. The fruit was small and of a deep colour, fairly firm, and flavour very good. (Award of merit.)

H. P. Sturgis, Esq., Leatherhead (gardener, Mr. W. Peters), sent a fine box and two plants of the new Strawberry, named Jevons' Late Prolific. The plant seems free, and the fruit is long in shape, bright in colour, and fine in flavour. (First-class Certificate.)

Messrs. Cross and Son, Wisbech, sent a new Codlin Apple, Victoria. The fruit were about 2in diam., and the spurs on a separate plate were furnished.

From Henry Park, Esq., Trent Park, New Barnet, came six fine fruits of Coronation Tomatoes. Some must have weighed nearly 12oz, and were even and well coloured.

Mr. Geo. Lee, Clevedon, sent Gooseberries Scorpion and Red Currant La Versailles, represented by fine bunches of bright fruit.

Messrs. Robert Veitch and Son, Exeter, sent a plate of the Pea Glory of Devon, a useful Pea, well podded, with about ten seeds to each. The haulm also sent indicated vigour.

Mr. J. Hobday, Romford, Essex, sent a plate of the fine Pea Essex Hero, large well-filled pods, and very even.

W. Taylor, Esq., Hampton, sent a seedling Pea, Libra, the fruits of which were almost 8in in circumference, and nicely coloured.

Mr. Andrews, Campsea Ashe, staged a fine Black Currant, Campsea Ashe, the fruits were of fine size, and beautifully black.

#### Floral Committee.

Mr. Amos Perry again was largely represented by a collection of hardy flowers and aquatics. Amongst the former, *Campanula lactiflora cærulea*, *Ostrowskia magnifica*, *Iris aurea*, *Lilium Parryi* and *aurea*, with *Calochorti* in variety, were very fine. Amongst the latter were *Nymphae Marliacea carnea* and *N. chromatella* and many other interesting plants, shown very effectively in shallow pans. The many aquaria of varying sizes added much to the attractiveness of the exhibit. The Loganberry was also well shown on fruitful canes.

Messrs. Jones and Sons, of Shrewsbury, staged about seventy vases of Sweet Peas. The colours were very various, and amongst the most beautiful we noticed Venus, flesh pink; Lady Grisel Hamilton, rich mauve; Black Night, Baden Powell, Her Majesty, and Black Burpee. A good deal of the natural foliage was incorporated, and added much to the general effect.

Mr. M. Pritchard, of Christchurch, had a choice exhibit of hardy flowers, in which Phlox in variety (Denis Puck, quite a mauve, and Ball of Fire, a deep cerise, being very fine), *Centaurea ruthenica*, *Lilium dalmaticum* (a lovely deep crimson

flower), Campanulas, Achilleas, and Scabiosas in variety were items worthy of notice in an interesting and well staged group.

Messrs. W. Cutbush and Sons, Highgate, staged an effective and well arranged group of Malmaison Carnations with Palms and *Adiantum cuneatum*. *Cecilia*, *Nautilus*, *Baldwin*, and the new one, *Maggie Hodgson*, with *Sault*, *Mr. Trelawney*, and *Princess of Wales* were all fine specimens of this charming flower.

Messrs. J. Cheal and Sons, Crawley, had a small exhibit of hardy flowers and Sweet Peas. Amongst the former *Galega officinalis* and *Coreopsis grandiflora* were well shown, and *Celestial*, *Shadzada*, *Cardinal*, and *Mrs. Eckford* were charming examples of Sweet Peas.

Messrs. Jas. Veitch and Sons, Limited, Chelsea, had a charming exhibit of *Nymphæas* in bowls, amongst *Pteris* and *Bamboos*, against the entrance. A fine specimen of *Yucca recurva* was an object of great interest. Amongst the *Nymphæas* staged, *N. Marliacea rubro-punctata*, *N. Marliacea carnea*, *N. Ellisiana* and *atro-purpurea*, and *albida* were interesting specimens.

Messrs. John Peed and Sons, Norwood Road, S.E., staged a collection of Tree and Malmaison Carnations and a few border varieties. *Cecilia*, *R. H. Measures*, *J. Coles*, *Dorothy*, and *Winnie Peed* were well flowered specimens. *Bamboos*, *Aralia Veitchi* and *Palms* were incorporated in the exhibit.

Messrs. Barr and Sons, Covent Garden, were again in their accustomed place with hardy flowers, aquatics and Sweet Peas, *Normanda*, *Didymus rosea*, *Ceanothus Gloire de Versailles*, and *Achilleas*, *Eupatorium*, *tancetifolia*, and *Veronica longifolia rosea* were amongst the most interesting items in the former section. *Gladioli* were also staged in effective variety, and the *Nymphæas* in shallow pans were very pretty. *N. Marliacea albida* and *atro-purpurea* were chief amongst those shown.

From Regent's Park Botanic Gardens (head gardener, Mr. E. F. Hawes), came *Crimum eruentum*, represented by a fine plant with a spike bearing as many as six flowers fully expanded and about double that number to develop. A very effective inflorescence.

Messrs. James Veitch and Sons, Limited, Chelsea, sent *Lilium concolor*, the true type, a lovely, deeper orange, and the perianth segments beautifully reflexed. The leaves are about 1½ in by ¾ in, and lanceolate linear in shape. The height of the plant over all is about 12 in to 15 in. Messrs. W. Bull and Sons, Chelsea, exhibited *Maranta insignis* from Brazil. It is effectively coloured in the leaves, which have small blotches of deeper green of varying sizes, but placed with great regularity throughout the entire surface. The petiole is about 5 in, and the blade or lamina 9 in to 10 in by 2½ in at its greatest width. Where the deep blotches occur, the portion of the leaf is raised. The under surface is a deep maroon. (Award of Merit.)

Mr. Charles Turner, from the Royal Nurseries, Slough, sent a fine bunch of that exquisite and popular Rose, *Caroline Testout*. The individual flowers were well finished. The same firm also exhibited *Rose Muriel Pike*—a very similar Rose to the former, but with much less colour. The perfume is almost identical. Messrs. B. R. Cant and Sons, Colchester, staged a charming exhibit of new Roses. The new seedling *Mr. B. R. Cant*, *Beryl*, and *Papa Gontier* were well shown. The grand new seedling *H.P. Ben Cant* and the new *H.P. Frau Karl Druschki* were both in splendid form, and *Mildred Grant* was also in fine form. Messrs. W. Paul and Son, Waltham Cross, Herts, staged their new multiflora Rose *Waltham Rambler*. The inflorescences are closely compact, and the individual flowers are about 1½ in diameter and the petals white at base going to purple as the margin is approached. The vigour of this variety seems excellent.

Mr. Arthur W. Wade, Colchester, sent two bunches of *Lilium excelsum* and *Brownei*, represented by fine flowers. (Award of Merit.) Also *Ben Cant*, a grand new *H.P.*, with excellent vigour. The individual blooms are about 4 in in diameter and a depth of nearly 2 in. Colour rich crimson, form perfect, and perfume exquisite; individual petals beautifully waved. (Award of Merit.)

Messrs. W. Paul and Son, Waltham Cross, staged their new climbing Monthly Rose, *Field Marshal*. The blooms, which are deep crimson in colour, are of good substance and well furnished, and in some cases are well over 3 in in diameter.

Messrs. Paul and Son, Cheshunt, had a small exhibit of new Roses, in charming colours. Amongst those especially noticed were *Killarney*, *Frau Karl Druschki*, *Lady Moyra Beauclerc*, *Corallina* as a garden Tea, and *Leoni Lamesch* and *Eugénie Lamesch* as specimens of the *Polyantha* section, were very beautiful.

#### Medals.

FLORAL COMMITTEE.—Silver-gilt Flora for herbaceous flowers to Mr. M. Prichard, Christchurch, Hants. Silver-gilt Banksian for group of Carnations to Messrs. W. Cutbush, Highgate, N.; for group of hardy plants to Mr. Amos Perry, Winchmore Hill, N.; and for new Roses to Messrs. B. R. Cant and Sons, Colchester. Silver Flora for group of Sweet Peas to Messrs. Jones and Son, Shrewsbury. Silver Banksian for hardy *Nymphæas* to Messrs. James Veitch and Sons, Limited, Chelsea; and for group of hardy plants to Messrs. Barr and Sons, 12 and 13, King Street, W.C.

#### Awards.

The following awards were made to new plants:—*Maranta insignis* (Award of Merit), from Messrs. Bull and Sons.

Climbing Monthly Rose *Field Marshal*, from Messrs. Wm. Paul and Son. Award of Merit.

*H.P. Rose Ben Cant* (Award of Merit) from Messrs. B. R. Cant and Sons, Colchester.

*Cattleya Wiganiana*, from Sir Fred. Wigan, Bart. First Class Certificate.

### The National Carnation and Picotee (Southern Section).

A good exhibition was got together in the Drill Hall on Tuesday last, the blooms being large and clean on the whole, and quite creditable after such a season.

#### First Division.

The first prize was for twenty-four bizarre and flake Carnation blooms, dressed on cards, in not less than twelve sorts. Only three collections were staged, and Mr. Charles Turner, Slough, with distinctly larger flowers, all very clean, was placed first. Each flower was even, and nearly all were full in the centre, the weak ones being *Jas. Hall*, *Mrs. Tom Lord*, and *Sarah Payne*. The set included the following: *Sarah Payne*, *Edw. Adams*, *Autocrat*, *Geo. Herbert*, *Jas. Hall*, *Admiral Curzon*, *Thalia*, *Duke of York*, *Jas. Taylor*, *Chas. Henwood*, *Mrs. Tom Wood*, *Stains-on-Weir*, *Sir Garnet Wolseley*, *John Keet*, *Dr. Hogg*, *Ed. Adam*, and *Thaddeus*. The famous *Battersea* carnationist, Mr. Martin Rowan, was a fair second with good blooms of *Mars*, *Jas. Douglas*, *John Wormald*, *Merton*, *W. Skirving*, and *Constance Grahame*. The third prize here was awarded to Mr. Martin R. Smith (grower, Mr. Chas. Blick), *Warren House*, *Hayes*, *Kent*, whose flowers were large, but badly affected by rain.

Four entered for two dozen selfs in a dozen distinct varieties, and here Mr. Smith was far and away superior. His blooms were all strong and admirably staged. Taking them as they come, we find *Cecilia*, *Mike Farren* (grand colour), *Bomba*, *Ensign*, *Daffodil*, *Bridegroom*, *H. J. Cutbush*, *Much the Miller*, *Sir Beys*, *The Naiad*, *Gerda*, *Joan of Arc*, *Anne Boleyn*, *Grand Vizier*, *Agnes Sorrel*, *Comet*, *Mrs. Eric Hambro*, and *Roderick*. The colours were nicely disposed, the yellows being at the top. Mr. Chas. Turner had very good blooms, but too much flattened out. His scarlet coloured *Grand Duke* was a strong flower; and *Sir Beys* was rich and good. Third came Messrs. Blackmore and Langdon, *Twerton-on-Avon*, *Bath*, with *Rosina May* as their best.

The twenty-four Fancies from Mr. Smith were exceedingly fine, and wonderfully rich for the season. *Lily Duchess*, *Elaine*, *Bellicent*, *Argosy*, *Jack Spraggon*, *Pagan*, *Amphion*, *Molly Maguire*, *Caird*, *Author*, *Cavalier*, and *Carmen* were very handsome, full, and even. Charles Turner came second, and Messrs. Blackmore and Langdon third. Four entered.

Mr. M. Smith again led for the twenty-four white ground Picotees with *Muriam*, *Canymede*, *Mrs. Beswick*, *Little Phil*, and *Somerhill* as his best. Mr. C. Turner again followed second, and Messrs. Tuplin and Sons, *Newton Abbott*, third.

The yellow grounds were very rich and effective, Mr. Smith leading for the twenty-four in a dozen sorts. Here the most conspicuous flowers were *Espoir*, *Caliph*, *Aleinous*, *Childe Harold*, *Dalkeith*, *Lady St. Oswald*, *Miss Annie McCrae*, and *Fairy Queen*. Messrs. Turner and Tuplin and Sons again followed in this order.

Mr. Smith with *Cecilia*, which he grows so finely, led for six selfs of any one variety; Messrs. Blackmore and Langdon second with *Master F. Wall*; and third, Messrs. Tuplin and Sons with *Mr. J. Douglas*. In the succeeding class for six yellows or buff ground Fancy Carnations, Messrs. Blackmore and Langdon with *Willie Tyler*, very large, rich, and handsome; Mr. Smith second with *Mountjoy*; and Messrs. Tuplin and Sons third with *Sunset*.

Messrs. Blackmore and Langdon led for six Fancy varieties in Class 8 with the white ground *Millie*; second, Mr. Smith with *White Witch*; and third, Messrs. Tuplin and Sons with *Countess d'Archiac*.

Six yellow ground Picotees from Mr. Smith, in Class 9, were exceedingly handsome. He staged *Gronow*; and in the same class the second place fell to Messrs. Tuplin and Sons with *Empress Eugénie*. For the twelve Carnations, distinct, without dressing or cards, Mr. Smith was again unassailable, showing his blooms in three-forked patent stands. These were strong and capital sample blooms. Messrs. Blackmore and Langdon, second; and Messrs. Tuplin and Sons, third.

#### Specimen Blooms.

BIZARRES AND FLAKES.—Scarlet, single bloom: First, Mr. F. Wellesley, with *R. Houlgrave*; *R. C. Cartwright*, second. Purple: Mr. Wellesley here again led with *G. Melville*; and Mr. Nash, with *Guardsman*, scored for the crimson. Mr. Wellesley, with *Merton*, led for the rose bizarre. A better method of arranging the flowers would avoid confusion in reporting.

**SELFS.**—The whites were strong, and Mr. Wm. Spencer, jun., led with Much the Miller. Mr. Charrington, with Mrs. Siebright, was first in roses; Mr. M. Smith won in crimsons with H. J. Cutbush; for purples, Mr. F. Wellesley with Sir Bevis. The same exhibitor led for yellow with Germania; and Mr. Spencer in the forefront among buffs with Benbow. Competition was very keen, and numerous very fine flowers were presented.

**FANCIES.**—For a single yellow ground, Mr. Spencer, with Queen Bess, was foremost; and under "other Fancies" the same exhibitor had premier honours with a very handsome bloom of Artemis.

#### Picotees—Single Blooms.

Red, heavy-edged, Mr. F. Wellesley with Ganymede; light-edged, ditto, the same with Etna. Purple, heavy-edged, Mr. R. Sydenham with Fanny Tett; ditto, light-edge, Mr. Spencer with Lavinia. Rose or scarlet, heavy-edge, Mr. R. Sydenham with Mrs. Foster; light-edge, Mr. F. Wellesley with Fortrose. Yellow ground, heavy-edged, Mr. M. Smith with Lucy Glitte; light-edge, Mr. F. Wellesley with The Pilgrim.

#### Second Division.

For twelve Fancies, distinct, F. Wellesley, Esq. (grower, Mr. J. Gilbert), Westfield Common, Woking, was first, and closely followed by Messrs. Thomson, High Street, Birmingham; the third award falling to Messrs. Phillips and Taylor, Bracknell, Berks. In the leading set were Argosy, Helios, Mrs. F. Wellesley, and Voltaire, all very handsome.

Mr. F. Wellesley was easily first for the twelve white ground Picotees, with typical samples of W. H. Johnson, Lavinia, Mrs. Beswick, Fortrose, W. E. Dickson, and Favourite. Messrs. W. Pemberton and Son, Coal Pool, Walsall, with less refined blooms, came second; and Thomson and Co., third.

Five entered for the dozen yellow ground Picotees, Mr. Wellesley furnishing a very presentable set, the flowers being heavier than those of Mr. B. Nash; third came Messrs. Thomson and Co. The blooms were all clean, smooth, and nicely developed.

Half a dozen entered for the six self Carnations, the premier honours falling to Mr. F. Wellesley with Benbow (only one weak bloom); second to Messrs. Thomson and Co., with Mrs. Eric Hambro; and third, Messrs. Phillips and Taylor, with Cecilia.

Again Mr. Wellesley scored in the following class for six yellow ground Fancies, having Argosy; second, Messrs. Thomson and Co., with Galileo, very rich purple; and third, Messrs. Phillips and Bracknell, Berks.

For six yellow ground Picotees, Mr. Wellesley, with beautifully edged blooms of Lady St. Oswald, led out of five. Second came Mr. B. Nash, with Mrs. Tremayne; and third, Thomson and Co., with Mohican.

The succeeding class was for six distinct Carnations, selfs and Fancies, three blooms of each. Mr. F. Wellesley with perfect flowers, well set up, beat his opponents, four in number. Messrs. Thomson and Co. succeeded, also with fair flowers; and third, Messrs. Phillips and Taylor, their best being Lady Hermione.

#### Third Division.

Starting at Class 25 for six bizarres and flakes, Mr. J. J. Keen, of 37, Avenue Road, Southampton, with blooms equal to the best. Mr. Jas. Fairlie was placed second; and Mr. A. Greenfield, Sutton, Surrey, third. For six selfs in Class 26, the leading place was taken by Mr. W. Spencer, jun., Bexley Villas, Windsor; Mr. R. C. Cartwright, King's Norton, Worcestershire, second; and Mr. E. Charrington, Mayfield, Chislehurst, came third. The blooms were all of merit; six entered. Again Mr. Spencer well deserved the first prize for six Fancies, his blooms being very large, nicely coloured, and good in form; Artemis was especially fine. Mr. E. Charrington, Mayfield, with very bright flowers, followed second; and third, out of seven, came Mr. R. C. Cartwright.

For six white ground Picotees, Mr. Spencer was first with good flowers, and was closely followed by Mr. R. C. Cartwright; and third, Mr. Jas. Fairlie. The best varieties were Little Phil, Lavinia, Ganymede, Amy Robsart, Favourite, and Miriam. Mr. Spencer beat Mr. E. Charrington, and third Mr. Cartwright, in Class 29, for six Picotees, yellow ground, the best being Lady St. Oswald, Lady Bristol, and Eldorado. Nine entrants contested Class 30 for three selfs, the award being again captured by Mr. Spencer, with smooth and good blooms of Mrs. Eric Hambro; second, Dr. Moore Binns, Merriman's Hill, Worcester, with the same variety; and third, Mr. Cartwright, with Dick Donovan, another pearly white. Seven came forward with three buff or yellow ground Carnations each, and Mr. Spencer had the best, staging Eldorado; second, Mr. C. A. Philbrick, Erleigh Road, Reading, with Artemis; and third, Mr. R. C. Cartwright, with Voltaire.

For three Fancies, yellow or buff ground, Mr. E. Charrington,

Mayfield, with Mrs. Siebright, came first; second, Mr. Spencer, with Artemis; and third, Mr. R. C. Cartwright, with the same. Three yellow ground Picotees, in Class 33, resulted in first for Mr. Spencer, second for Mr. Charrington, and third for Mrs. Brookes-Smith, Olrig House, St. Mary's Church, Devon. In Class 34, for selfs and Fancies, three varieties, in vases, Mr. Cartwright was first; Mr. Spencer, second; and Mr. Fairlie, third.

In Class 35, for six bizarres and flakes, Mrs. W. V. Charrington, Hever, Edenbridge, occupied the premier place, staged Phoebe, Master Fred, Guardsman, J. S. Hedderley, and R. Houtgrave, with a good seedling to make the number; second, E. H. Buckland, Esq., Winchester; and third, E. J. Wootton, Esq., Winchester. Class 36, for six selfs, which was well contested, Mrs. Eleanor Best, Abbott's Ann, Andover, taking the first prize. The lady's blooms were Lady Hermione, Cecilia, Waterwick, Dick Donovan, Hayes' Scarlet, and Miss A. Campbell, a very nice lot of well formed and well coloured flowers; second, C. L. Gordes, Esq., Sydney Park, Walton-on-Thames; and third, E. J. Wootton, Esq., Winchester. For six Fancies in Class 37, E. J. Wootton, Esq., was first; staged fine blooms of Duchess of Roxburgh, Eldorado, Argosy, Persimmon, and Galileo; second, Mrs. M. V. Charrington, Hever, Edenbridge; and third, E. H. Buckland, Esq., Winchester.

Class 38, for six Picotees, with white ground, had seven entries; and C. L. Gordes, Esq., Walton-on-Thames, was first, having on his stand Lavinia, Fanny Sell, Mrs. Gorton, Grace Darling, Amy Robsart, and Sommerhill; second, E. J. Wootton, Esq., Winchester; and third, Mr. M. V. Charrington. In Class 39, for six yellow ground Picotees, the first place was taken by C. L. Gordes, Esq., the varieties staged being Mrs. R. Sydenham, Lauzan, Evelyn, Child Harold, Carrain, and Lady St. Oswald.

In Class 40, for six Carnations and Picotee blooms, dissimilar, Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath, took the honour with Cecilia, Alice Brown, Blanche, Snowball, Mrs. Wall, and Nellie Eskins; second, L. A. Neave, Esq., Ingatestone; and third, W. Moore Burns, Esq., Worcester. In Class 44, for twelve specimens in pots, not exceeding 8½ diam., Martin R. Smith, Esq., Hayes, was first with good specimens of Sir John Ramsden, Author, Agnes Sorrel, and Lady Hillington; Mr. Charles Turner Slough was in the second place with much dwarfier stuff.

In Class 46, for group of Carnations plants, area 50 sq. ft., Martin R. Smith, Esq., Hayes (grower, Mr. C. Blick), was to the fore. The group was tastefully arranged with the aid of Bamboos, Palms, and Adiantum cuneatum. The varieties attracting most attention were Firebrand, Bridegroom, Mrs. Charles Barry, Reade, Infanta, Moll Flanders, and many other fine flowers were included. Mr. Chas. Turner, Slough, was second with a small group of Tree Carnations.

For two cut blooms (seedlings), in Class 41, the first prize went to H. S. Bartlett, Esq., Shooter's Hill, for Mr. A. Roland Bartlett, a deep crimson border Carnation. A. F. Fitter, Esq., 15, Streatham Hill, S.W., was second in Class 47 for a group of Carnations. No first prize awarded.

In Class 49, for a vase of Carnations or Picotees, or together, E. J. Wootton, Esq., Winchester, was first with an epergne prettily arranged with pale yellow Carnations and grasses, with Adiantum cuneatum; second, W. Spencer, Esq., Windsor; third, Mrs. J. W. Euston, Chadwell Heath, Essex. In Class 50, for three sprays, Mrs. Hadley, Parkside, Reigate, was first with three charming sprays, arranged with Asparagus plumosus, great taste was evidenced in choice of specimens; second, E. J. Wootton, Esq., Winchester; third, W. Spencer, Esq., Windsor.

Class 51, for six buttonholes, P. C. Cartwright, Esq., King's Norton, Worcestershire, was first with six well arranged buttonholes, with own foliage and Adiantum cuneatum; second, Mrs. M. V. Charrington, Hever, Edenbridge; third, W. Spencer, Esq., Windsor.

#### Premier Blooms.

Best bizarre, Master Fred, from Mr. F. Wellesley; flake, Sportsman, from Mr. Pemberton; self, Mrs. G. Siebright, from Mr. E. Charrington; Fancy, Queen Bess, from Mr. W. Spencer; white ground, heavy edged Picotee, Mrs. Foster, from Mr. R. Sydenham; ditto, light edge, Fortrose, from Mr. F. Wellesley; heavy edged, yellow ground, Dalkeith, from Mr. M. Smith; light edge, yellow ground, Mrs. W. Heriot, from Mr. M. Smith.

#### Miscellaneous.

Mr. James Douglas, Edenside, Great Bookham, Surrey, contributed a group of his seedling Carnations, with others that are now most popular. Amongst yellow ground Fancy Carnations we noted Argosy, Daniel Defoe, Mrs. Tremayne, Lady Bristol, Gronow, Amphion, Evangeline, and Nelly Ryan, a purple flaked sort of good appearance. Agnes Sorrel, dark red self; Clio, Salomea, Boreas, Sappho, Elfin, Pagan, and Sir J. Falstaff were others noted.

### Hereford and West of England.

The thirty-sixth exhibition of this society, the oldest it may proudly be claimed, the parent of all existing Rose shows, was held in the Shire Hall, Hereford, last Wednesday, July 16, with a success far superior to any that have taken place of late years. This happy result mainly followed from the leading professionals—Messrs. A. Dickson and Sons, Belfast and Ledbury; B. Cant, F. Cant and Co., Prior and Sons, Colchester; J. Townsend, Worcester; G. Prince, Berks; J. Mattock, Oxford, and King's Acre Nurseries, Hereford—and amateurs, Rev. G. H. Pemberton, Essex; Rev. F. R. Burnside, Essex; Rev. F. G. Fulford, Haxley; Rev. R. Powley, Upton Seadamore; Messrs. Conway Jones, Gloucester; Mr. R. Foley Hobbs, Worcester, putting in an appearance, as this year, owing to the late fixture of the show, such distant exhibitors were set free from their engagements at more comestable and commercial centres.

The day being brilliantly fine, the attendance was unusually good, and everything couleur de Rose, floriculturally and financially. Owing to the late, cold, dragging spring, Roses, as may be supposed, were not uniformly good. Indeed it may be said that in point of condition, the blooms were either

lacked freshness and smoothness Messrs. Dicksons' seventy-two was a notable exception, of which we append a list.

Division I. (Nurserymen).—First prize, Messrs. Dickson and Sons. Back row: Madame C. Testout, Helen Keller, Marie Bannmann, Gladys Harkness, A. Colomb, Madame E. Verdier, M. Rady, Robert Scott, Marchioness Dufferin, Lady Clamorris, Duke of Fife, Duchess of Portland, Thomas Mills, Florence Pemberton, Mamie, Bessie Brown, Tom Wood, Lady M. Fitzwilliam, Ulrich Brunner, Mildred Grant, Gustave Piganeau, Lady Myra Beauclerc, Comtesse de Ludre, Her Majesty. Middle row: A. K. Williams, Edith D'Ombraïn, Shandon, Innocente Pirola, John Ruskin, Pierre Notting, Lady Ashtown, François Michelin, Alice Lindsell, La France, Mrs. R. G. Sharman Crawford, Duchess of Bedford, Maman Cochet, H. Vernet, Hon. E. Gifford, J. S. Mill, White Maman Cochet, Danmark, Mrs. John Laing, Earl Dufferin, Muriel Grahame, Suzanne M. Rhodocnachi, Jean Ducher, Margaret Dickson. Front row: M. C. Ramey, Marquis Litta, a new seedling, François Gurtin, Mrs. E. Mawley, K. A. Victoria, Madame Luizet, Comtesse de Nadaillac, Victor Hugo, Souvenir de S. A. Prince, Madame Cusin, Queen Alexandra, Berthe Giemen, Medea, Prosper Langier, White Lady, Souvenir d'un Ami, Golden Gate, Etoile de Lyon, Comtesse

A Good Strain of Herbaceous Calceolarias. (See page 78.)

exceptionally good or exceptionally bad; while owing to the scorching day previously, many exhibits held out signals of distress from their long journey. Many varieties, notably among the new and lately introduced into commerce, have well sustained their reputation, while others, especially among Messrs. A. Dicksons' H.T.'s have already made their mark. The praise of their Mildred Grant was, of course in everybody's mouth; while H.P. Ben Cant is undeniably a splendid addition, in point of colour, substance, and robust habit, to the not too large proportion we have among the dark varieties. Another H.P., Frau Karl Druschki (Lambert), struck us more than any other Rose in the show. It was shown superbly as a treble in one of Messrs. Dicksons' stands, and will undoubtedly become more and more popular as it is better known, not only from its size, substance, and high centre, but from its exquisite colour, being snow white, differing from most of its class, in which lemon, blue, or other neutral tints are observable. Medea, Tea, was shown grandly by Messrs. Dickson and elsewhere, and should be in every collection. Among other Roses "whose year it is," and which were remarkably well shown, and in several exhibits, were Horace Vernet and Earl of Dufferin among Dark Roses (and here, *en passant*, H.P. Bacchus, may be strongly recommended as a most reliable dark variety but seldom exhibited). Maman Cochet, Tea, was shown everywhere splendidly, and its sport, White Maman Cochet, equally good and perfectly distinct. While several of the exhibits

Serenye, Beauty of Waltham, Marchioness of Londonderry, Mrs. Bateman, François Louvat. Second prize, Messrs. D. Prior and Sons; third prize, Messrs. B. R. Cant and Co.

Messrs. A. Dickson also carried off the following:—First prize, Class 3, for trebles; first prize Class 4, and for eighteen Teas or Noisettes with Maman Cochet, Souvenir de S. A. Prince, Mrs. Edward Mawley, White Maman Cochet, C. Mermet, Etienne de Lyon, Madame Wagram, Comtesse de Turenne, Bridesmaid, Golden Gate, Souvenir d'un Ami, Hon. E. Gifford, Jean Ducher, Madame Cusin, Innocente Pirola, Princess of Wales, Medea, Comtesse Nadaillac, Madame de Watteville.

Also first prize, Class 17, twelve of any one light Rose with H.T. Mildred Grant. First prize, Class 19, any one yellow Rose with Tea Medea.

First prize Class 18, with any one dark Rose, fell to Messrs. Prior and Son with Horace Vernet, and for any one white Rose to Rev. F. R. Burnside, with White Maman Cochet. This was indeed a grand collection, keenly competed for and fairly won in an open class by an amateur.

In the amateur division the first prize—Class 5, twenty-four varieties—was carried off by the Rev. G. H. Pemberton, with a fine, well staged but somewhat travel worn collection, of which the following is a list:—Charles Lefebvre, Caroline Testout, Général Jacqueminot, Ulrich Brunner, Marie Baumann, Her Majesty, Comte Raimbaud,

Suzanne M. Rhodocanachi, François Michelon, H. Vernet, Bessie Brown, Madame Hausman, Mrs. John Laing, Beauty of Waltham, K. A. Victoria, A. K. Williams, Comtesse de Ludre, Jeannie Dickson, Marie Rady, Danmark, Comtesse de Paris, Tennyson, Victor Hugo, Madame C. Crapelet. After the Rev. J. H. Pemberton came Mr. Conway Jones with second prize, and behind him in third place Mr. M. Whittle.

Following on the above commentary we append the awards in the most important classes:—

**NURSEYRMEN.**—Class 1, seventy-two varieties: First, Messrs. A. Dickson and Sons, Belfast and Ledbury; second, Messrs. D. Prior and Son, Colchester; third, Mr. B. Cant, Colchester. Class 2, thirty-six varieties: First, Messrs. J. Townsend and Sons, Worcester; second, Mr. John Mattock, New Headington, Oxon; third, Mr. G. Preece, Longworth, Berks. Class 3, twenty-four varieties, three of each: First, Messrs. A. Dickson and Sons; second, Mr. B. Cant; third, Messrs. Prior and Son. Class 4, twelve varieties, Hybrid Teas: First, Messrs. A. Dickson and Sons; second, Messrs. Prior and Son; third, Mr. John Mattock.

**AMATEURS.**—Class 5, twenty-four varieties: First, Rev. J. H. Pemberton, Havering, Essex; second, Mr. Conway Jones, Hucclecote, Gloucester; third, Mr. M. Whittle, Leicester. Class 6, eighteen varieties: First Mr. R. Foley Hobbs, Thornoloe, Worcester; second, Rev. J. G. Fulford, Flaxley, Gloucester; third, Rev. R. Powley, Upton Scudamore. Class 7, twelve varieties, three of each: First Mr. Conway Jones; second, Rev. J. H. Pemberton; third, Mr. R. Foley Hobbs. Class 8, six varieties, Hybrid Teas: First, Mr. R. Foley Hobbs; second, Rev. Preb. G. E. Ashley, Stretton Rectory; third, Mr. Conway Jones.

**HEREFORDSHIRE AMATEURS.**—Class 9, eighteen varieties: First and gilt medal, Rev. G. E. Ashley; second, Mr. E. W. Caddick, Caradoc, Ross. Class 10, twelve varieties: First Mr. H. Stanton, Tyberton Court, Hereford; second, Mr. W. E. King King, Bodenham Manor, Leominster; third, Mr. T. Llanwarne, Hillside, Hereford. Class 11, six varieties, three of each: First, Rev. Preb. G. E. Ashley; second, Mr. W. E. King King. Class 12, twelve distinct Roses, one truss each (exhibition or garden), stems to be the natural growth, not disbudded, of characteristic habit (given by Mr. J. H. Arkwright): First, Rev. Preb. G. E. Ashley; second, Mr. J. H. Arkwright; third, Mr. A. W. Foster, Brockhampton Court.

**TEA AND NOISETTE DIVISION.**—**NURSEYRMEN.**—Class 13, eighteen Teas or Noisettes, distinct: First, Messrs. A. Dickson and Sons; second, Mr. G. Prince; third, Messrs. Prior and Sons. Class 14, twelve Teas or Noisettes, distinct: First Mr. John Mattock; second, Messrs. J. H. Townshend; third, Mr. W. T. Mattock.

**AMATEURS.**—Class 15, twelve Teas or Noisettes, distinct: First, Mr. Conway Jones; second, Rev. F. R. Burnside, Great Stambidge, Essex; third, Rev. R. Powley, Upton Scudamore. Class 16, six Teas or Noisettes, distinct: First, Mr. H. Stanton; second, Mr. C. Holbrook, Hucclecote House; third, Mr. R. Foley Hobbs.

**OPEN CLASSES.**—Class 17, twelve, one sort of any light Rose (H.P.): First, Messrs. A. Dickson and Sons; second, Mr. B. Cant. Class 18, twelve, one sort of dark Rose (H.P.): First, Messrs. Prior and Son; second, Mr. B. Cant. Class 19, twelve, one sort of any yellow Rose: First, Messrs. A. Dickson and Sons; second, Mr. G. Prince. Class 20, twelve, one sort of any white Rose: First, Rev. F. R. Burnside; second, Messrs. Prior and Son.

The hardy perennials were a very conspicuous feature in the show. There was a large number of entries for the open class of thirty-six bunches, Mr. W. T. Mattock, Headington, Oxford, taking first prize for a varied and admirably grouped collection. In the amateur class of twenty-four bunches the first prize fell to the Rev. Sir George Cornwall, Moccas Court, Herefordshire, with a nice collection, in which were some rare and interesting specimens. The decorative division was hardly up to the mark, the dinner decorations especially lacking in design, or rather absence of design and originality, but where ladies are the competitors all criticise stops. It only remains to add that the judges in the nurserymen classes were the Rev. C. H. Bulmer, Mr. Conway Jones, and Mr. John Cranston. In the amateur classes Mr. W. Dickson, Mr. W. Drews, and Mr. W. Prior.

In our generation the Rose show, *pur et simple*, was in vogue. The public went or stayed away, but they got nothing more for their money. Things are strangely altered nowadays. Every undertaking, on both sides of the Atlantic, is worked on the broad lines of a "combine" (a new word, taken on wonderfully). It matters not whether on the enormous scale of ocean traders or the retail store of inland traders, the principle is the same. It is the active spirit of this restless age. Nothing singular has happened. We must move with the times, and the people love to have it so.

The custom has prevailed for several years at the Hereford Rose Show, and—all praise be given the marvellous versatility and resourcefulness of the energetic hon. secretary—has proved a great success; most advantageous to the society's exchequer, and with a minimum of outrage to the feelings of veterans like your reporter. Certes! No subsidiary element of amusement could

be introduced better than those at present adopted: Theatricals, admirably acted, unobtrusively located, and not obligatory to the enthusiast, on whom a feast of Roses, from the first to the last course, as so many dainties, never palls.—**HEREFORDSHIRE INCUMBENT.**

### National Rose, Manchester, July 19th.

Manchester has always boasted of its annual Rose show which is held at the Botanical Gardens, Old Trafford, and it seems almost incredible that so splendid a position in which to hold a show where the queen of flowers can be seen in every phase of its beauty, should have been without a visit from the National Rose Society for so long a period as seventeen years. Yet such is the case, but if one must judge by the huge attendance and the enthusiastic interest manifested by the public, committee, and exhibitors on Saturday last, there is no reason to suppose another visit will not shortly be made.

Unlike the Whit Show, the exhibition house was not requisitioned, the annexe with its ample promenade space, the roof of which is beautifully clothed with creepers, was used instead, with the result that a more effective scene of floral beauty as viewed from the end steps could not well be conceived. There one could see the long rows of cut flowers superbly staged so as not to break the view afforded by the charming display of garden Roses far away in the distance. Mr. P. Weathers, the popular curator, and his able assistant, Mr. Paul, acting in conjunction with Mr. Edward Mawley, who came down the previous evening, are to be highly complimented in dealing with so large a number of blooms. The luncheon was presided over by Alderman Hay, Lord Mayor of Manchester, who gave the members present a most hearty welcome. He congratulated all on the excellence of the show, and hoped that another visit would shortly be made. Mr. Edward Mawley, Mr. James Brown, and Alderman Gibson briefly addressed those present.

Speaking strictly now of the exhibits, it must be confessed that considering the unusual season through which we have been passing, the quality and number of blooms must have come almost as a revelation to many present, for not only were they of fine formation, but the colour in most instances was exceedingly good.

In the nurserymen's section the chief prize was for the Jubilee trophy and gold medal, a most spirited competition ensuing for this extra class of thirty-six distinct varieties. The honour fell to Messrs. Harkness of Hitchin, with a smart set of blooms, the following being the list:—Her Majesty, Fisher Holmes, Maman Cochet, François Michelon, Madame Eugène Verdier, Ulrich Brunner, Duchesse de Morny, Muriel Grahame, Exposition de Brie, Comtesse de Nadaillac, Earl of Dufferin, Madame Joseph Bonnaire, Kaiserin A. Victoria, Mrs. W. J. Grant, Maréchal Niel, Camille Bernardin, Mrs. Mawley, Madame Delville, Gustave Piganeau, Mildred Grant, Bartholomy Joubert, Ulster, Chas. Darwin, Bessie Brown, Mrs. J. Laing, Horace Vernet, White Maman Cochet, Xavier Olibo, Souvenir d'Elise, Marie Baumann, Suzanne Marie Rhodocanachi, Alfred Colomb, Medea, Killarney, and Mrs. Cocker. The second stand was from Messrs. R. B. Cant and Co., Colchester, and the third from Messrs. Alex. Dickson and Sons, Newtownards, Co. Down. This was a class in which brilliant form came much to the front.

Mr. Hugh Dickson came well to the front for thirty-six distinct, having Mrs. J. Laing, Captain Hayward, Gladys Harkness, Comtesse de Ludre, Helen Keller, Alan Cheales, La France, J. S. Mills, Mrs. Sharman Crawford, Etienne Levat, Gustave Piganeau, Bessie Brown, Marquis Litta, Heinrich Schultheis, and Baroness Rothschild; Messrs. Jno. Townshend, Worcester, were second, and Messrs. W. H. Frettingham, third.

The class for sixty distinct was a great contribution to the show; Mr. B. R. Cant scoring with a rich stand of the following varieties: Earl of Dufferin, Marchioness of Londonderry, Le Havre, Caroline Testout, Charles Lefebvre, Papa Lombard, Gustave Piganeau, Eugène Verdier, Countess of Oxford, Countess of Rosebery, Marie Rady, Madame J. Bonnaire, Dupuy Janin, Bessie Brown, Ulrich Brunner, Helen Keller, Bernard Andre, Countess of Caledon, Paul Neron, Mrs. Jno. Laing, Comtesse de Nadaillac, Muriel Grahame, Ben Cant, Ulster, King Cole (a fine dark seedling), Golden Gate, François Michelon, Mrs. Cocker, Comtesse de Ludre, Maman Cochet (two varieties), Jean Scupert, Frau Karl Druschki (a lovely white), Alfred Colomb, The Bride, Duke of Teck, Kaiserin A. Victoria, Tom Wood, Lady M. Fitzwilliam, Reynolds Hele, Marie Verdier, Madame Hausman, Merveille de Lye, Camille Bernardin, Bridesmaid, Beauty of Waltham, Souvenir de S. A. Prince, Mrs. Sharman Crawford, Maurice Bernardin, Medea, A. K. Williams, Madame Cadeau Rainy, Mrs. Mawley, S. M. Rhodocanachi, Comtesse de Nadaillac, Charles Darwin, Clio, Mrs. J. Laing, Pierre Notting, and Duchesse de Morny. In Messrs. A. Dickson's capital second stand there were exceptionally fine blooms of Caroline Testout,

Muriel Grahame, Mrs. R. G. S. Crawford, Florence Pemberton, Lady Clanmorris, Mrs. W. J. Grant, Margaret Dickson, and Mrs. Sandford.

The class for twenty-four trebles saw Mr. Harkness and Messrs. Alex. Dickson and Sons in very close proximity, the final decision going to the former for what appeared to onlookers to be the heavier stand, and one which gave the judges some trouble. The first was as follows:—Pride of Waltham, Fisher Holmes, Bessie Brown, Helen Keller, Earl of Dufferin, Mrs. W. J. Grant, Alfred Colomb, Maréchal Niel, Mildred Grant, Madame E. Verdier, Mrs. Mawley, François Michelin, Marquise Litta, Killarney, Exposition de Brie, Lady Clanmorris, Her Majesty, Ulrich Brunner, Caroline Testout, Gustave Piganeau, La France '89, Kaiserin A. Victoria, Louis Van Houtte, Mrs. John Laing. Messrs. Alex. Dickson had of their best Mildred Grant, Florence Pemberton, Ulrich Brunner, Caroline Testout, Earl of Dufferin, and Helen Keller. The third prize fell to B. R. Cant and Co., Colchester.

Mr. Hugh Dickson secured the prize for sixteen trebles, which were good in every way; Mrs. J. Laing, Comtesse de Ludre, Alan Cheales, Mrs. Sharman Crawford, Marquise Litta, and Oliver Corail being most conspicuous. Mr. J. Mattock was second with much smaller flowers, and Mr. W. H. Frettingham, Notts, third.

For twelve Teas or Noisettes, distinct, Messrs. Alex. Dickson and Sons had a splendid box; Duchess of Portland, Catherine Mermet, Maman Cochet, Kaiserin Auguste Victoria, Meta, Madame Cusin, and Comtesse de Nadaillac showing to great advantage.

The gold medal for any new Rose went to Messrs. Alex. Dickson and Sons for Florence Pemberton, a fine grower and rich shade of pink. The medals went to Messrs. Townshend for Mrs. Jno. Laing; F. Cant and Co. for Mildred Grant; and Messrs. D. Prior and Sons for Maman Cochet.

For twelve of any white or yellow Rose, Mr. Frank Cant, Colchester, won with Bessie Brown. Mr. Geo. Prince, Oxford, second with White Maman Cochet, and Mr. Prior with the same variety. A lovely box of Mildred Grant secured the light pink or rose-coloured class for Messrs. Alex. Dickson and Sons, who also had the distinction of winning the class for new Roses.

A beautiful feature of the show was the class for exhibition Roses in vases to be equally distributed round the vases so as not to face one way only, to consist of not more than seven blooms of each in twelve varieties and not more than six varieties of Teas and Noisettes, and not to exceed a space of 6ft. by 4ft. Handsome they were, Mr. G. Prince placing on the table for first prize Marie Van Houtte, Reynolds Hole, Bessie Brown, Mr. W. J. Grant, and C. Mermet being most convincing. Mr. J. Mattock was a grand second.

If the larger type of Roses found their friends, so too did the exhibition of garden Roses which were simply exquisite in form and arrangement, and much in advance of anything seen in Manchester. Mr. Jno. Mattock here scored a most decisive victory, the effect in colour combined with a most natural idea in setting up, making a perfect study. Not quite so artistically done was the second prize lot staged by Mr. Frank Cant, who is heartily to be congratulated. Mr. Geo. Prince was a splendid third. In this section were noticed especially fine Cecile Brunner, Marjorie, Hebe's Lip, Killarney, Meta, Papillon, Souvenir de C. Guillot, and Camoens.

#### Amateurs' Section.

The exhibitors in this section in several instances surpassed that of the open, and more particularly does this apply to those staged by Messrs. E. B. Lindsell, R. Foley Hobbs, H. V. Machin, and the Rev. J. H. Pemberton, who were all in great form. The Jubilee trophy and gold medal was the special object over which the honours of the day centred, and bravely was the battle waged, the victor undoubtedly being Mr. E. B. Lindsell, of Hitchin, who contributed an almost faultless twenty-four distinct, of which Maman Cochet, Horace Vernet, Ulrich Brunner, Bessie Brown, Mrs. J. Laing, and La France gave the best account. Mr. H. Machin, Workson, was a capital second with extra Mrs. Sharman Crawford, Mrs. J. Laing, and Bessie Brown. Rev. J. H. Pemberton came a good third.

Mr. E. B. Lindsell again came forward for thirty-six distinct, the Rev. J. H. Pemberton keeping him very hardly pressed, with Mr. R. Park, Bedale, third. In the very large number of classes in this section the palm must be given to Messrs. Lindsell, Foley Hobbs, H. V. Machin, C. Burgess, R. Park Curtis, the Rev. J. H. Pemberton, F. C. Burnside, and F. Langtree. The N.R.S. medals went to the Rev. R. Langtree for Prince Arthur; the Rev. F. C. Burnside for Maman Cochet; and Mr. Foley Hobbs for Mildred Grant.

Sweet Peas came from Mr. H. Eckford and Messrs. Jones, of Shrewsbury, and Hinton, of Warwick, whilst a splendid stand of herbaceous plants were staged by Messrs. Dickson and Robinson of Manchester, and Mr. E. Mawley won for garden Roses.—R. P. R.

#### Diss, July 15th.

St. Swithin's was cloudless and very hot, and nothing but strong young Roses could stand long in the tent at this little show. In the open Class, 36, Messrs. B. R. Cant and Sons were easily first, having fine specimens of Mildred Grant, Horace Vernet, Duke of Edinburgh, Mrs. E. Mawley, Comte de Rainbaud, and Ulster. As to this latter Rose, your reporter of the Southend Show must have made some mistake in saying that "Ulster runs Mrs. W. J. Grant very close in colour and general character, &c." They are certainly very different indeed in colour; and in shape and general character I really think there are few Roses more widely apart. Messrs. F. Cant and Co. were second, showing White Maman Cochet, Waltham Standard, Gladys Harkness, and Victor Hugo well. Rev. A. Foster-Melliar third, with a good Duchesse de Morny. For the principal amateurs' class, twenty-four Roses, in the absence once again of Mr. Orpen, to contend for the Free Memorial Challenge Cup, Mr. Foster-Melliar retained possession of it with a good stand. A large, quite perfect and clean White Maman Cochet (best Tea) was his finest bloom, and Mrs. J. Laing (best H.P.), François Michelin, Maman Cochet, Maréchal Niel, and Comtesse de Nadaillac were also good. Rev. J. A. Fellowes, of Bunwell Rectory, Attleborough, followed, some twenty-four points behind, with a fair Maman Cochet. The third prize card seemed to have gone astray. For twelve Teas (open), Messrs. B. Cant and Sons led, followed by Messrs. F. Cant and Co. Mr. Fellowes was third with nice young buds, and Mr. Foster-Melliar was awarded an extra prize (which his stand hardly deserved) for what would have been fine Teas but for the rain of the week before. Roses in the local classes, as usual, soon presented a sorry spectacle under the influence of the heat. Mr. Fellowes brought his Roses on his motor-car—a new departure, but perhaps a useful one for those far from a station.—W. R. RAILLEM.

#### Formby, July 16th.

It was most fortunate for the committee of this popular society that the show was postponed for a week, otherwise the Roses would not have been so perfect, and worse still, a wet day would have had to be recorded. Instead, the day was one of brilliant sunshine, and many of the most notable families were present. The entries were larger than usual, most noticeable improvement being in the greenhouse flowering plants and table decorations. To show the interest taken to encourage horticulture, one may incidentally mention that no fewer than twelve silver cups are given, of the value of from two guineas to five guineas each. The Rose classes were admirably filled, and occupied almost one side of the large tent.

For twelve distinct Mr. B. Kennedy, the best known of our local growers, carried off the award with splendid Mrs. W. J. Grant, Helen Keller, La France, Captain Hayward, Madame Cusin, Madame Cochet, Prince Arthur, Comte de Rainbaud, Victor Hugo, Suzanne Marie Rhodocanachi, and White Maman Cochet. The Rev. J. B. Richardson ran a good second with Prince Arthur, fine. For twelve Teas or Noisettes Mr. Kennedy won with Mrs. W. J. Grant, La France, and Emilie Genin, extra good. Mr. C. Hacking second. Miss M. A. Rimmer had Clara Watson, Mrs. J. Laing, S. M. Rhodocanachi, La France, Marie Baumann, and Ulrich Brunner, an excellent six distinct.

For six light Roses Mr. Luther Watts had Mrs. S. Crawford, Mrs. Mawley, and C. Testout, and for darks Miss M. A. Rimmer with Marie Baumann, Prince Arthur, and A. Colomb. Mr. L. Watts secured the prizes for two other classes. The N.R.S. medal for the best bloom in the show went to Mr. T. Carlyle for Mrs. R. G. Sharman Crawford.

The classes for those growing less than 200 plants were taken by Messrs. E. Sergeantson and T. Pugh, the former gentleman winning the N.R.S. bronze medal for the best bloom in this section.

Sweet Peas were represented by thirteen twelve, but they were not of last year's quality, no doubt owing to the severe weather. The cup presented by Mr. H. Middlehurst was finally won outright by Mr. W. Dodd, junr., an amateur who deserves very great credit. A capital second was found in Mr. J. H. Page. The varieties Black Knight, Blanche Burpee, Prima Donna, Salopian, Lady Mary Currie, Prince of Wales, Duke of Westminster, Hon. Mrs. Kenyon, Gorgeons, Lottie Hutchins, Emily Eckford, and Countess of Lathom.

The table decorations were exceedingly handsome, Miss M. A. Rimmer having Iceland Poppies, grasses, and Gypsophila for first. The second was a grand treatment of Syringa, Maidenhair Fern, and Smilax, with touches of Lily of the Valley. Miss Rimmer also won with a large well-arranged basket of Roses with Prunus foliage. Mr. Luther Watts had splendid Glorinas and Tuberous Begonias, double and single. Some grand Petunias came from Mrs. Rathbone, and excellent Ferns and greenhouse plants from Messrs. F. A. Rockliff and Jonathan Formby.

Fruit and vegetables were of more than the usual merit.

tho classes being so numerous as to make it an impossibility to include names. Messrs. Alex. Dickson and Sons, Newtownards, showed magnificent Roses and Sweet Peas. Amongst the former was a new seedling, Queen Alexandra, a fine well-built bloom, beautifully pointed and of a charming shade of flesh. The Sweet Peas, as with the Roses, were marked by the highest of quality and colour. A first prize and an award of merit was quickly granted.

Fifty varieties of Sweet Peas were superbly set up by Mr. Henry Eckford. They were clean and in all the newer varieties. Mr. Henry Middlehurst also set up a large and effective display, each being granted an award of merit. It only remains to be said that finances are right, and with Mr. Kennedy as chairman, Mr. E. H. Bushell as treasurer, and the stirring secretary Mr. T. Pugh, the society is bound to flourish. —R. P. R.

### Edinburgh Summer Show.

A very successful and enjoyable exhibition, promoted by the two Scottish metropolitan societies, the Royal Caledonian and the Scottish Horticultural Association, was held in the Music Hall, Edinburgh on the afternoon and evening of the 16th inst., when the display, considering the untoward nature of the present Scottish summer, quite surpassed expectations both in quantity and quality. A Rose show used to be a part of the regular programme of the Royal Caledonian, and many successful exhibitions were held in the Music Hall in olden times, and afterwards in the Waverley Market. The expenses attendant on exhibitions in the Waverley Market are great, and the public are "dread" to draw to any building on a warm summer's day, so that constant large deficits so emasculated the courage of the Royal committee that the exhibitions were discontinued. Some years afterwards Mr. M. Todd, when president of the association, resuscitated these exhibitions on a small scale, and for several years they have been held in various places in the city, and as educative and interesting meetings have proved most successful. A happy idea, on this the Coronation year, brought the two societies together, and the present first combined effort we hope is the first of many joint efforts to promote horticulture, and to show how becoming well is it for such as are brethren to dwell in unity, or at least in close amity.

The present exhibition was not in the ordinary sense a competitive one. There was no prize list: but growers were invited to contribute whatever was thought by them to be of interest. The gardeners and nurserymen responded liberally when the season is taken into account, but what was hoped would be the leading feature, viz., Roses and Strawberries, were somewhat scanty. The deficiency in Roses was nobly made up by the splendid exhibit of Mr. Hugh Dickson, the veteran of Belfast. We have seen Mr. Dickson's Roses, we think, every year since he first brought Ireland into notice as a worthy source of the great emblematic flower of England, and we think he never staged a finer lot of blooms than on the present occasion. He had some twenty stands filled with blooms of delightful freshness, brilliant colours, and admirable size and substance. To name the varieties would only weary the reader, as our pages at present are filled with repetitions of the same leading sorts at every exhibition. Captain Hayward, that delightful free-blooming variety, was greatly in evidence, and proves that in good or bad seasons he is always to be relied upon. Among Pinks, Mrs. Sharman Crawford held a conspicuous place, while Marquis Litta was also prominent. One or two for size were too utterly too-too. The Rev. Alan Cheales is too huge, and it will be a pity when the Rose emulates in size the exhibition Japanese "Mum." Novelties were not wanting, and two of Mr. Dickson's own children received certificates. One, Hugh Dickson, a noble crimson of good size, great substance, and brilliancy of colour, yet perfectly distinct in shade, well deserved the "first class" awarded. The other, Dorothy, a chaste, light blush flower, is also promising. A gold medal award unanimously given by the judges was richly deserved. Messrs. Croll, of Dundee, had also a handsome exhibit of show and garden Roses, but, while not wanting in quality, showed that their time this season has not yet come; a silver medal was awarded them.

Hardy border flowers were well represented, specially so by Messrs. Cunningham and Fraser, who filled a large stage arranged with a magnificent collection rich in Peonies and Iris, but with many rarer sorts in choice condition. This was awarded a gold medal. Messrs. Dicksons and Co. had also a beautiful table of Streptocarpus, Pelargoniums, Lobelias, Water Lilies, &c.—the last-named, in basins of water, were specially beautiful. Messrs. Storrie and Storrie, of Dundee, had a very varied exhibit of single Begonias (very beautiful, but just large to a fault), Streptocarpus, Sweet Peas, Lobelias, &c. This was, perhaps, the most tastefully arranged exhibit in the hall, and reflected great credit on Mr. Storrie; a large silver medal was awarded. Messrs. Laing and Mather, the King's seed-men, of Kelso, were strongly in evidence with their great speciality, the Malmaison, of the various varieties of which they exhibited most capitally grown specimens. They had also blooms of the sensational American

variety, Mrs. T. W. Lawson, which, though beautiful, was hardly worth the trumpet-blowing it received; a silver medal was awarded this collection. Mr. Eckford kindly sent a large variety of the best sorts of Sweet Peas, though this season has not produced them quite up to Mr. Eckford's usual form; yet they were a most attractive collection.

Other trade exhibitors were Messrs. Campbell and Sons, Blantyre (beautiful lot of Carnations); Messrs. Kelway, Langport, (a choice exhibit of Gaillardias and other showy hardy flowers); Mr. Lornie, Broxburn (Iris, summer Chrysanthemums, &c.); Mr. John Downie, who exhibited an interesting table of plants. Messrs. Laird and Sons filled the orchestra with a very beautiful lot of plants, which added much to the appearance of the hall. The arrangement of this exhibit was most commendable, and reflected great credit on the artistic capacity of the firm; a large silver medal was awarded. One of the most charming exhibits in the hall was by Messrs. Todd and Co., art florists, who, to quote from the "Scotsman," were "as usual, to the front with a really exquisite table of bouquets, baskets of Roses, vases of Sweet Peas, &c., which was a centre of attraction during the day and evening." On this table a shower bouquet of a pale heliotrope Cattleya, Odontoglossum Alexandrae, and Lily of the Valley, interspersed with delicate fronds of Asparagus, was a perfect vision of loveliness marvellous in its lightness and daintiness. A gold medal was awarded this exhibit.

Private gardeners contributed liberally to the show, and many highly creditable displays were made, which space forbids us to particularise. The exhibit of Mr. Kidd, gardener, Carberry Tower, was specially honoured by the award of a gold medal. Malmaison Carnations were his leading feature, and were very fine, also Uriah Pike, very rich in colour. Tastefully arranged vases of Roses were also conspicuous, especially one of Gustave Regis, a very beautiful decorative Rose, which as a buttonhole flower has hardly an equal. Paul's Carmine Pillar was also in beautiful form; a handsome vase of Lilium Harrisii and vases of Sweet Peas added charm to this beautiful exhibit. Mr. Alexander, gardener, Niddry, exhibited a table of twenty-four varieties Sweet Peas, which showed very high culture, and were effectively set up. This was much the finest Sweet Pea exhibit, and was awarded a silver medal. Mr. Wood, Oswald House, tastefully filled a table in the vestibule of the hall with admirable plants from his well known Orchid and other treasures. Mr. Macmillan, Trinity Grove, had a charming little exhibit of choice hardy flowers, Tea Roses, &c. Mr. Swales' Streptocarpus, Gloxinias, and Sweet Peas were much admired. Mr. Cowan, Penicuik, exhibited a very beautiful table of British Ferns in rare varieties, and remarkable for their freshness and healthy appearance. Mr. Comfort (the popular S.H.A. president) had an attractive exhibit of herbaceous plants, as had also Mr. Murray Thomson, the energetic secretary of the Caledonian. Mr. Whytock, Dalkeith, exhibited some interesting specimens of cut flowering shrubs.

A very attractive exhibit was made by the School of Gardening for Women, Inveresk, consisting of Sweet Peas, Iris, and other flowers, also Mushrooms, Cucumbers, honey, &c.; a bronze medal was awarded. Fruit was small in quantity, but of excellent quality. The Royal Sovereign Strawberries from Mr. Scougal, Eskbank, were marvellous for size and colour and bloom. Nice Strawberries were sent by Mr. Whytock. Mr. Murray, Culzean, contributed beautiful Pine Apples and Melons; Grapes came from Mr. Wann ("Kennet").

The arrangements were most admirably carried out by Messrs. Thompson and Lonie, the twin secretaries, to whom great credit is due.

### Wye Agricultural College.

Last Saturday was prize day at this college, when Viscount Midleton, Lord Lieutenant of the County of Surrey, presented the diplomas and other rewards. Professor A. D. Hall, principal of the college, presided, and in his address appealed for support from farmers and their sons. Viscount Midleton congratulated the college on its steady progress. Every year, he said, emphasised the growing importance of such institutions, as Great Britain had to face competition not only from the Continent of Europe, but from that vast continent across the Atlantic which is entering so seriously into rivalry with us in all branches of trade, commerce, and industry. How severe the competition was only those, who, like myself, had taken a long and practical interest in agriculture, could estimate. We were handicapped in many respects because those engaged in agriculture had no really scientific knowledge of the principles underlying it. They knew they did wrong, and nothing more, and often when they did right they did not know why they did it or what effect would be produced by their operations. That was just what they could learn at Wye College, where an honest and successful attempt was being made to cope with the problems of technical education in connection with the most important of our national industries, and to teach farmers the principles on which they ought to go in order to make the soil more fertile and the yield more productive.

# THE BEE-KEEPER.

## Extracted Honey.

It is now generally admitted that a colony will produce twice as much extracted as comb honey, and when it is considered that the former, if fully ripe when removed from the hive will keep any length of time, and that sections are apt to crystallise as the cold weather advances, and consequently become almost unsaleable, the advantages of producing run honey will be apparent. To visit a successful bee farm at the time of deprivation where extracted honey is worked for, and see the tiers of supers containing this natural sweet creates an imperishable impression on the mind. There are districts, however, where sections are practically unknown, and the bee-keeper should therefore endeavour to obtain his harvest in the form in which it is demanded locally.

Two facts must not be lost sight of in producing honey in any form in quantity: first, nothing but the most powerful colonies will give satisfactory results, and in order that there may be no misconception as to what a powerful colony is, it is as well to interject here that the constant stream of traffic entering and leaving the hive appears to block the entrance, and the air resembles nothing so much as a hailstorm in progress. Secondly, that the perfection attained in queen rearing has been so marked that the ordinary single brood chamber is found insufficient to accommodate the increased fertility of the modern queen. Providing a young, and consequently prolific, queen heads a stock there will be little difficulty experienced as regards strength if properly managed, and the following plan may be worked:—So soon as the brood chamber is completely filled with bees and brood and the honey flow commencing, which is evidenced by the bees falling heavily on the alighting board with distended bodies, and the whitening and extending of the cells next to the top bar of the frames, or the presence of thin newly gathered nectar in the hive, a shallow super or a second brood-chamber should be placed underneath to enlarge the brood-nest, and after first placing the queen excluder over the body box another shallow super should be placed above. The one below will immediately be taken possession of by the queen for ovipositing, and the bees thus obtained will in the height of the season rapidly fill the combs of the one above with honey, which may be removed and extracted as soon as completed and returned to be refilled, or further shallow supers may be given and left on the hive until the close of the harvest.

When giving honey chambers care must be taken to prevent the escape of heat at the junctions between badly fitting supers. This may be accomplished by inserting lengths of folded newspaper, or pasting slips of paper over the crevices. If there is any doubt as to the strength of any colonies they should be worked on the doubling plan. Greater harvests are secured by this than by any other method of management. To double, all that is necessary is to remove the inferior queen, if any, and if it is found desirable to preserve her, make a nucleus on the old stand and place the hive and its contents bodily upon the other, making a double chamber, which by the hatching above and below will soon teem with life, and this enormous population will fill the upper storey with honey, which should be extracted as often as necessary, or if in possession of plenty of drawn out combs (one of the apiarist's valuable assets when working for extracted honey) they may be added and left until the close of the season. The nucleus should consist of one bar of brood and bees and two empty combs, as a proportion of the bees from the doubled portion will return to the old stand and strengthen it. Colonies thus treated are effectually prevented from swarming, and the union of the two stocks enables it to place a larger force of honey gatherers in the field than would have been possible if left in their former condition. Although this method involves some labour, it has greater compensations, and the plan has many adherents. The use of shallow supers for extraction is preferable, as they are not only handled with greater facility, are less liable to fracture in the exterior, but are also more rapidly sealed by the bees, and uncapped. Where deep combs are used throughout, the top stories should, after extracting, be placed below the brood chamber to give the queen room for egg laying, as the cleaning of the wet combs acts as a most powerful stimulant. By this means swarming is checked with tolerable certainty by obviating its greatest incentive, namely, completion of brood nests. There is no loafing, the energy of the bees being directed to storing surplus, consequently there is a much greater yield.—E. E., Sandbach.

## Kalanchoe flammea as a Bedding Plant.

As the world grows older so in some respects it improves, and surely if we can hope to see masses of this superb Crassulaceous plant adorning our outdoor beds in summer (with *Primula obconica* as an edging!) may we not report progress? At Kew it has been given a trial, and the plants seem perfectly satisfied with the conditions of life under which they are now existing.

## Hardy Fruit Garden.

**MORELLO CHERRIES.**—The large amount of growth which the trees have made necessitates that the removal of superfluous growths, especially those of a weakly character, shoots unsuitably placed, also strong, succulent, sappy growths which have started from old parts of the wood, should be dealt with gradually. Where the trees have hitherto had the required attention, rubbing out the undesirable shoots early, less manipulation in this respect will be demanded, but attention must be given to selecting the best growths for laying in. This is necessary alike in the interest of the wood as well as the fruit, the latter requiring abundance of light and air to develop size, flavour, and colour, while the same conditions must be present to ripen the wood. The greatest proportion of wood is laid in at full length, and if enough can be found to properly furnish the whole required, this will be found better than retaining shortened shoots with the idea of forming spurs. Trees from which the fruit has been cleared may be frequently syringed in order to destroy or keep down attacks of red spider. Moisten the roots thoroughly, which is another aid in subduing insects and ensuring general good health. The fruit may be kept late if so desired by netting up a whole or portion of a tree.

**PEACHES AND NECTARINES.**—The syringing, which is practised frequently with a view to maintaining the trees clean, cannot be continued after the fruits commence to colour. At this stage, if not carried out before, lay down a liberal mulching over the roots in order to retain the moisture in the soil as long as possible. To expose the fruit fully to the influences of light and air, all the growths it is necessary to retain should be carefully laid in position and the superfluous shoots removed. Even then the fruit may be shaded by large leaves, which ought to be drawn on one side, slightly tying them. In some cases the leaves may be partly shortened, but this is not advisable to a great extent.

**PLUMS AND DESSERT CHERRIES.**—The methods adopted in laying in and regulating the growths are practically the same. Trees allowed to make plenty of free growth, which it is not intended to shorten back, ought to have early attention in training it in, not only for the neat and cultivated appearance it gives the trees, but so that the shoots not required can be dispensed with, thus allowing a free circulation of air and light among the growths, indispensable aids to the ripening of the fruit and the perfecting of the wood. Neglect in training, and the consequent crowding of the wood, results in weakened growth, attacks of insects, and a check to the free swelling of the fruit. Both Plums and Cherries are very subject to the attacks of fly, and when trees or walls are so infested before laying in the shoots make an attempt to give them a general cleansing with a garden engine, followed by an application of insecticide, except where the fruit may be ripe or ripening. Dipping the shoots in a vessel containing some effective solution may be used where the tips of the shoots are much infested. A thorough syringing must be given as soon as the trees are cleared of fruit. The majority of Plums, however, being still green and swelling, both water and insecticides may be used. Give special attention to the roots, seeing that they have an adequate supply of moisture at this period, for the demands of food and moisture are at their maximum, and if not sufficiently met are the great cause of throwing trees into ill-health, inviting disease and insect attacks. Applying a mulching over the roots will prevent the hot sunshine drying up the surface, and it is also useful for distributing the water and liquid manure supplied, and maintaining the roots cool. Wall Plum trees bearing an exceptionally heavy crop may advantageously have the fruits thinned, removing all the smallest and ill-formed fruits, also reducing the number of bunches. The branches of either Plums or Cherries on which summer shortening is practised must have the shoots pruned to four or five leaves.

**APPLES AND PEARS.**—In whatever form trees on walls are grown it is necessary to check the further growth of the summer side shoots by shortening them to four or five leaves. Second growth of a vigorous character often results from this, but it is less likely to do so now than when carried out earlier. Where there is an exceptionally good crop some thinning of the fruits must be carried out or there will be much small fruit of inferior quality. It will be best to go over the trees several times, but to the early varieties which will mature next month the final thinning may be given. Liquid and artificial manure may be given with advantage to swelling fruit.

**STRAWBERRIES.**—All runners which are well rooted in small pots should have the runner wire cut and the pots removed

to a hard base where they may stand closely together until required to plant or pot. Afford sufficient room to runners recently epgged down, and continue to select the best of others for the same purpose until the whole of the stock required has been obtained. Beds which have been the longest in existence ought, if giving signs of deteriorating, to have the plants cut or pared off close to the ground, left to dry, and then be burnt. Before occupying the ground with another crop thoroughly trench and manure. As soon as possible after fruit has been gathered and the best runners secured, clear away the whole of the growth between the rows.—EAST KENT.

### Fruit Forcing.

**VINES: IN POTS FOR EARLY FORCING.**—The Vines for starting in November, to afford ripe Grapes in late March or early in April, should be of the early and sure forcing varieties, such as White Frontignan, Foster's Seedling, Black Hamburgh, and Madresfield Court; and now have the wood ripe, thoroughly hardened, and the buds plump. If there be any doubt about these matters, keep the house rather warmer by day, 80deg to 85deg, closing early so as to raise the temperature to 90deg or 95deg, and open the ventilators at night. Afford sufficient water to prevent the leaves flagging, or liquid manure may be given to help them to plump the buds. The foliage cannot have too much light. Keep the laterals well in check, leaving no more than absolutely necessary to appropriate any sap that may be in excess of the leaf requirements, and so prevent the principal buds starting. When sufficiently ripened, as indicated by the wood being brown and hard, and the buds prominent, they may be removed to a position outdoors in the full sun, standing on boards or slates in front of a south wall or fence, securing the canes to the face of the wall, only giving water to prevent the foliage falling prematurely, and having some waterproof material to throw the water from the pots in case of heavy rain. In this position they will rest, even if the leaves are not shed. When the leaves turn yellow, or the falling hue, commence reducing the laterals, and when most are off cut them in closely, and shorten the canes to the length required, placing them in an airy shed or cool, dry place, until the time arrives for forcing. Keep the soil dry, yet not so dry as to cause the wood to shrivel.

**EARLIEST FORCED HOUSES.**—This will vary as to time in different establishments, but it is not desirable, as a rule, to start permanent Vines before the beginning of December, so as to afford a supply of ripe Grapes from the end of April or beginning of May onwards. A dry atmosphere is desirable for the thorough ripening of the wood, but it will not be necessary, except in the case of young Vines not forced early before, to employ artificial heat. All laterals should be kept stopped, and rest gradually induced by keeping the house cool and the border dry. Inside borders, however, may require watering, but if they have been mulched it may not be necessary, and outside borders will not take any harm, provided they are of sound materials and well drained. Premature ripening of the foliage is undesirable, and is generally occasioned by destruction of the leaves through red spider or too dry an atmosphere and deficiency of water at the roots. Where the Vines are in an unsatisfactory condition prepare for lifting at an early date, getting fresh loam and clean drainage, so that the work may be done quickly when started. There is no danger of losing a crop provided these operations are properly and promptly performed. It is desirable to lift the roots and place them in fresh soil nearer the surface whilst there is foliage on the Vines; therefore work of this kind ought not to be delayed in the case of Vines that are to be started early in December, which will need pruning by the middle of September, or a little later in the case of lifted Vines. In the case of Vines that have not before been started early, and are required for affording ripe Grapes at the end of April or early in May next season, it will be necessary to prepare them for the process, cleansing them thoroughly by syringing or an insecticide as soon as the crop is off; and, if there is any doubt about ripening the wood or plumping the buds, it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Give no more water at the roots than will prevent the foliage becoming limp. If the weather prove cold and wet employ fire heat in the daytime to maintain a temperature of 70deg to 75deg, with moderate ventilation, and turn the heat off at night to allow the pipes to cool. This will soon cause the buds to plump, the wood to ripen, and induce rest, which, for Vines to be started at the time named, should be complete by the middle to the end of September. When the Vines have the wood ripe ventilate fully day and night.

**SECOND EARLY VINES.**—Those started at the New Year have the crops cleared, and should be cleansed by means of the syringe or engine, and, if needful, by applying an insecticide. If there be any mealy bug or scale use petroleum, a wineglassful to 4 gallons of water, in which 8oz of softsoap and 1oz of washing soda have been dissolved, keeping the mixture well agitated whilst it is being applied by alternately squirting syringefuls of the mixture into the vessel and over the Vines, wetting these

and every part of the house thoroughly. It is best done on a calm evening, and should be repeated at intervals of a few days, and is best applied at a temperature of 135deg. If there are any plants they must be removed, and if the roots of the Vines be near the surface cover the border with dry short material to absorb the waste. Keep the laterals fairly in check, but not closely pinched, unless the Vines are very vigorous and not ripening the wood well, then keeping the house rather dry at night with all the air possible, and somewhat close and warm by day, will tend to promote the maturity of the wood and buds. In stopping vigorous Vines regard must be had to the principal buds, not pinching them so close as to cause them to start into growth. Such Vines should be kept without water until the leaves are a little limp, but not to the extent of flagging. Vines that, on the other hand, are not strong, having been enfeebled by continuous cropping or other causes, should be encouraged to make growth by applying liquid manure to the border, or top-dressings of the advertised fertilisers washed in; but, whatever extraneous foliage is made, must not be allowed to interfere with the free access of light and air to the principal leaves, which should be kept clean and healthy, so that they may appropriate some of the extra food, assimilating and storing it in the adjacent wood. Ventilate freely day and night.

**GRAPES RIPENING.**—Admit air constantly, enough with a gentle warmth in the pipes to insure a circulation. In ripening most Grapes swell considerably, therefore a certain amount of air moisture is necessary, and there must not be any deficiency of water at the roots. Give the border a thorough supply if necessary in the early part of a fine day, so that the superfluous moisture may be dissipated before night. Avoid, however, making the soil sodden and sour by needless applications of water or liquid manure, as this condition at the roots invariably results in shanking. If the Vines are heavily cropped, afford substantial food, such as nitrates, phosphates, and sulphates, or the advertised fertilisers, which act promptly and steadily, and allow them plenty of time, otherwise, if there be any hastening of the ripening and a deficiency of moisture and nourishment, it is likely the fruit will be defective in colour. A temperature of 60deg to 65deg at night, with air, is a great help to Vines with a heavy weight of Grapes. If kept warmer at night the Grapes ripen faster and colour less freely. A temperature of 70deg to 75deg by day from fire heat is ample, for heat will not impart colour. A moderate moisture should be secured by damping occasionally, and, if possible, allow the laterals to extend, for it is chlorophyll that is needed; but over-burdened Vines rarely push laterals, having enough to do to supply the principal foliage and Grapes with nourishment.—ST. ALBANS.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

The first part of the week was bright and very warm, the latter part was dull and much cooler.

### Trade Catalogues Received.

Alex. Dallièrre, Gand, Belgium.—*Autumn Price List (1902) of Stove and Greenhouse Plants.*

E. H. Krelage & Son, Haarlem, Holland.—*Dutch Bulbs.*

Ant. Roozen & Son, Overveen, near Haarlem.—*Dutch and Cape Bulbs.*

\* \* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy—Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in. broad by 7in. deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**VINES IN POTS (M.).**—The Vines no thicker than a lead pencil will be of no use for fruiting next season. They should be as thick as the middle finger or thumb, and have hard, brown, well-ripened canes, with eyes like nuts, and be in 12-inch or 13-inch pots. The Vines should be cut down to a couple of eyes, and when they have produced a few inches of growth next season shake out and repot into 7-inch or 8-inch pots, and when these are filled with roots, and before they become matted around the sides, shift into the fruiting pots.

**BUDDING CHERRIES ON MAHALEB STOCK—MADRES-FIELD COURT GRAPE CRACKING (J. M.).**—The early part of July is a proper time to bud this stock as well as the common Cherry stock. The most probable cause of the Grapes "splitting" is an insufficiency of nutriment during the early stages of swelling and an over-abundance when the Grapes are approaching the ripening stage, along with a moist atmosphere. This Grape is liable to crack, and requires a rather dry, well-ventilated atmosphere, with a drier condition at the roots when ripening than most other Grapes. Well grown it is one of the finest of autumn Grapes both in appearance and quality.

**STRAWBERRY PLANTS DYING OFF (S. H. G.).**—"I shall be glad if you can tell me what is the matter with my Strawberries. Numbers of them die off the second year, and the third year most of them go. The first season after planting they do well, but after that they seem to go back. The variety is mostly Royal Sovereign, though other varieties suffer as well. I may say I always bastard trench before planting in the autumn. Our soil is very heavy here. They seem to go so soon as the hot weather sets in."

[The stems are infested by eelworm, *Tylenchus devastatrix*, and also by a fungus, a species of *Fusarium*, which attacks the plants at the roots and ascends the stems in a similar manner to sleeping disease in Tomato plants, the vascular bundles or woody tissues being quite brown and dead. We have noticed the disease for a number of years, but have not been in a position to determine the species definitely, for it appears only *F. solani* specialised on the Strawberry, hence hardly distinct enough for naming *F. fragariae*. It is, however, very common, and like sleeping disease the plants do not collapse suddenly, but gradually, and generally in the second or third year of their existence from the runner. The eelworm may play some part in the collapse, but they are not affected by what is known as the Cauliflower disease—attack in the crown by stem-eelworm, *Tylenchus devastatrix*. Indeed, we consider the fungus the cause of the evil, and as it leads a saprophytic mode of life before assuming the parasite it is likely that a good liming of the land would act as a preventive. We should, however, prefer dressing the land, after bastard trenching and manuring, with basic cinder phosphate 7lb per rod, and 3½lb per rod of kainit, pointing in a month or six weeks in advance of planting and forking over the ground a foot deep before planting the Strawberry runners. In spring the plants, planted in August, may be dressed with a mixture in equal parts of superphosphate of lime and nitrate of soda, applying 1½lb of the mixture per rod when the plants are starting into growth, pointing in very lightly. This treatment we have found satisfactory, the plants being treated as biennials or at most triennials. As your land is heavy, it would, perhaps, be advisable to use sulphate of ammonia, one-third the amount, instead of kainit, and sulphate of ammonia in place of nitrate of soda. However, we have found the other preparations give good results.]

**MELONS FAILING (I. E.).**—Even if you had supplied us with some particulars relative to the treatment your plants have received and the weight of the crop, we suspect it would have been difficult for us to state the cause of the evil; without some such information it is impossible. The fact that your plants have produced a second crop suggests that they are more or less exhausted; this, with possibly some little inattention in watering and ventilating, would cause the foliage to collapse and the stems to shrink as in the specimens before us. Withholding water when the fruit is approaching maturity is often carried to excess, and many crops are thereby impaired if not ruined. Whether this is the cause of your failure we are unable to say, being quite without data for determining the point, or, in fact, for comprehending the case in a satisfactory manner.

**GRAPES NOT COLOURING (Idem).**—The chief cause of Grapes failing to colour is undoubtedly defective root-action or insufficient support; injury to the foliage, either by insects or scorching, also contributes to the evil. You do not think the Vines have been overcropped because one of them is not bearing more than 8lb of Grapes, but you omit to state either the age or size of the Vine, which information, as you must perceive on reflection, is absolutely necessary for us to form an opinion on that point. We have seen hundreds of Vines overcropped with 8lb of Grapes on each, and hundreds more undercropped with thrice that weight of fruit. Everything depends on the constitution of the Vine, the activity of the roots, and the fertility of the border. We strongly suspect that, although the crop may appear light, it is really too heavy, and that more vigorous root-action with fresh soil are needed to bring the Vine into a healthy condition that will enable it to finish the crop. This opinion is founded on the assumption that the foliage of the Vine is clean, not overcrowded, and apparently healthy. If we were acquainted with the actual condition of the Vines and border and the leading points of your treatment we should have no difficulty in answering your letter, but with a lack of knowledge on these points we cannot reply satisfactorily to ourselves.

**MELON LEAVES DISEASED (F. W.).**—"Will you please tell me the cause of my Melons going brown at the leaves, then drying right up? Others in the same house are doing well."

[The leaves are attacked by the fungus called *Cercospora melonis*, which forms irregular, dry, brown spots on the leaves, and the discolouration extends through the whole leaf, the plant attacked losing its leaves in great numbers daily, while the stem and roots are apparently quite sound. The disease often spreads quickly, being favoured by the dispersion of the dropped-out portions of the leaf bearing conidia. It is most abundant during a spell of dull damp weather, though the effects are most pronounced on a sudden change from such weather to bright and droughty, the whole leaves on a plant suddenly collapsing. As moist conditions favour the parasite it would be advisable to give plenty of air, especially in the early part of the day, and not allow water to rest on the foliage for any length of time, especially at night. As Bordeaux mixture, even in dilute solutions, injures the tender foliage, and ammoniacal solution of copper carbonate acts somewhat prejudicially on plants with hairy leaves, we should spray the plants with a solution of permanganate of potash, and also saturate the surface of the soil with the solution. Condy's red fluid, a wineglassful, or two fluid ounces to a gallon of soft water, would, perhaps, be quite strong enough, or one ounce of the crystals to three or four gallons of water. The chief thing, however, is free ventilation, even if fire heat have to be employed in order to maintain the required temperature, and admit of a circulation of air in dull damp weather.]

**STRAWBERRY LEAVES DISEASED AND FRUIT DECAYING (A Perplexed Gardener).**—"I am forwarding to you some Strawberry plants and leaves; could you please tell me the cause of their decay? The plants are in their second year, and until a week ago they appeared to be quite healthy, and very large fruit; now the fruits are decayed and the plants are dying. A plot in a gentleman's garden about six miles away are in the same condition. They have not had any kind of manure since March."

[The leaves are affected by the Strawberry leaf blight in a very malignant form, the spots not yet having appeared, but the mycelial hyphae is spread in the whole tissue of the leaves. This, *Spharebia fragariae*, will no doubt appear later. The fruit is infested with the white mould, *Botrytis candida*, and there are also the conidial condition of the leaf spot fungus, once called *Ramularia tulasnei*. The only repressive measure is to collect the affected fruit and burn it. To prevent the disease another season is to cut off the tops of the plants as soon as the fruit is gathered, covering them when dry with a light coating of straw, or shaking up the old mulching, and when all is dry burning them. This harsh treatment may seem likely to kill the plants, but such is not the case when the material for burning is not excessive, being attended with most satisfactory results, the burned over plants soon surprising the operator by the vigorous and healthy appearance of the new foliage which soon unfolds. The disease can be checked by spraying with Bordeaux mixture. Spraying should commence when the leaves unfold, and be repeated at intervals as required until the flowers appear.]

## Weaning Lambs.

So many farmers make their lambs fat and sell them to the butcher whilst yet sucking their dams, that the difficulties of weaning are not very generally understood. At the risk, therefore, of being accused of repetition, we propose to make a few observations on lamb management between now and Michaelmas. Farmers differ greatly in their opinions as to the best time to wean lambs. We ourselves do not think that any hard and fast line can be drawn in that respect, but due regard must be had to the state of health of the lambs, the milk supply of the ewes, and last, but by no means least, the available supply of suitable food which can be provided in lieu of that milk.

A lamb begins to graze at a very early age, and, seeing its mother enjoying the grass, naturally nibbles a little itself. It thus gradually takes to its natural vegetable food, of which, as its requirements increase, a larger daily quantity is consumed, whilst the mother's milk, which of necessity is at least a stationary, if not a vanishing quantity, becomes by degrees of less importance. It is the provision against too sudden a withdrawal of this support that should exercise the flock-master's greatest effort just now. For this reason we do not advocate very early weaning in a season like the present, when all pastures are very full of rank growth, and it is impossible to provide a bare one.

A lamb which has reached the age of eighteen or twenty weeks, during the whole of which time it has had a regular supply of milk, will feel the withdrawal of it, not only from the loss of a certain, if small, quantity of food, but from the lack of its digestive influence on the other food daily consumed, and this lack is especially felt when the grasses and clovers in the pastures are of a rank, watery, and indigestible nature. It is therefore most important that before weaning other aids to digestion should be introduced, and the lamb's appetite for dry food stimulated, so that when it is deprived of its dam it may be readily induced to eat mixed foods, which will make the loss of the mother's milk as little felt as possible.

There can be no doubt that the acidity of the milk is a great factor in aiding the digestion of other foods, and something of a similarly acid nature must be substituted for it. Malt in moderate proportion forms an invariable constituent of all the best lamb food mixtures, and it may be that it is the best substitute for the sugar of the milk. Chemists have always maintained that malt was a desirable food for stock, on account of its being an aid to digestion, and its excellence in this respect had much to do with the repeal of the malt tax.

When purchasing lamb food, then, see that you have some malt in it. Large farmers in some cases mix their own lamb foods, whilst others, and these some of the largest owners of sheep, buy their whole supplies. A mixture is easily enough made, but in mixing on a small scale there is difficulty in procuring the small quantity of the different constituents which is required.

A good lamb food should contain gentian, fenugreek, malt, barley, oats, maize, locust bean, and linseed cake. The first three and the last two are most important. When maize is cheap, and linseed cake dear, lamb foods are liable to contain too much maize and too little cake. How valuable a food locust bean is may be readily understood from the fact that sufficient pressure was brought to bear upon the Chancellor of the Exchequer to induce him to withdraw the import duty which he proposed to place upon it.

As a rule, it is not difficult to get lambs to take to a mixed food such as we have described, even if they have not previously been accustomed to trough food; but if, as should be the case, they are already familiar with linseed cake, the only care to be exercised will be that of judiciously limiting the allowance. Half a pound per head per day may be amply sufficient on a dry pasture, and in fine weather; but if the pastures are flushed with rapid growth, and the grass and Clovers very lush, give the lambs as much as they will eat, and at two meals instead of one.

Especially necessary is it to give a meal of dry food early in the morning; this should be the shepherd's first work, for if a lamb eats half a pound of lamb food in the early morning, it will not gorge itself afterwards with unwholesome watery food, which may be the only form of pasturage available.

If on the farm there is a field of Clover fog or after-math, this may be found most useful for lambs in August; but the fog should be allowed to get into flower before the lambs are put on it, and they should not be allowed to graze when the Clover is very wet with dew. They may be put in any bare pasture, or even a roomy yard at night, and given a good feed of trough meat in the morning before they return to the Clover, and at any cost their making of the latter a staple meal must be prevented.

Change of pasture does wonders for weaned lambs, and nothing is more beneficial than a run in the lanes to pick up a few bramble leaves or other natural tonics. An acre or two of autumn sown Cabbage, which is now ripe and well hearted, is the safest of all foods. The Cabbages can be given to the lambs anywhere with benefit. If the pastures be bare, the succulent Cabbages are most welcome, whilst if the grass be too plentiful and rank, the Cabbage will be found a wholesome alternative, and may be used for a morning meal in confinement until the Clover or grass has time to dry. The pulling and carting of the Cabbage may give trouble, but little compared to the benefit gained.

## Work on the Home Farm.

The rain, which fell heavily shortly after we wrote last week, was hailed by haymakers as anything but a blessing. As it was continuous, or nearly so, for forty-eight hours, it did little harm except to the few cases where the hay was made and still lying spread out. The wise haymaker gets his hay into cock as soon as he sees the clouds forming. As the season is such a late one few meadows were cut, and they only recently. The mowing machine has been hard at work since and has revealed some fine crops. Clover was disappointing: grass hay will be very good, and with a continuance of the fine hot weather we are now enjoying should be stacked in the best condition.

A record hay crop, both for bulk and quality, should be a good augury for the Corn harvest. The grain crops are looking wonderful; they have shot out well, and except here and there a patchy piece of Wheat the fields present a very full and level appearance. There has been much talk of a very late harvest, but though it will not be as early as the last year or two, it will be little later than the average, and we think far better from a money point of view. Considering the weight of straw there is very little laid Corn at present, but we shall not want much more rain before the crops are cut. They will severely test the qualities of our string binders as they are. There will certainly be a much greater consumption of string this year, and farmers who have not laid in a stock had better be up and doing.

The reapers must be overhauled and cleaned ready for use, but if they were put away in good condition little more than a good oiling may be required before they start work. All worn sections of the knives should be replaced with new ones, and the sections all well ground up. Note should also be made that all parts specially liable to breakage have their respective duplicates in stock. A machine which can only be worked for two or three weeks in a year must not be stopped for want of a little foresight and expense in providing duplicate parts.

Dairy cows are well maintaining the milk supply, and butter remains at a low price for the time of year. There is so much grass that milk and butter cannot fail to be plentiful and cheap. Eggs, too, are cheap for the time of year (sixteen for the shilling). There has been good fortune as a rule amongst chickens, and prices for young fowls will keep reasonable this year.

## State of Agriculture in Russia.

A South Russian landowner contributes to the "Novoe Vremya" a most pessimistic article on the condition of agriculture in Russia. Both landowners and peasants, he declares, are proceeding rapidly along the road to ruin; both classes have burdens of debt from which they can never hope to liberate themselves, and neither class is ever in a position to pay its taxes punctually and fully. In the winter there is no work for the peasants to do, while in the summer there are not enough men left in the villages to do the work required. Owing to their financial difficulties many cultivators of land are unable to keep horses, to employ modern machinery, or to manure the ground properly, so that not only is the land yielding less than it might do in favourable circumstances but it is in many cases being exhausted by faulty cultivation. The writer proposes that co-operative farming on a large scale should be introduced to remedy the evils of the present system.

## Wasted Forces.

**M**ISDIRECTION of energies and lamentable waste of force in gardens are actualities that are continually being brought before our notice. Economy teaches us to make the best use of everything we have at command. It very often happens, however, that forces are simply frittering themselves away to waste, which, if diverted into a useful channel, would prove to be of immense value. This sort of thing is going on in the commonplace, every-day routine of both garden and farm. It is frequently unseen, because the persons most interested have not taken the trouble to look into it. Only a small stream of water, continually running in a wrong direction, would soon flood and spoil a meadow; but by concentrating its force into one channel, it possesses power sufficient to drive a mill-wheel.

A striking illustration of wasted energies came before my notice only recently. In company with a farmer friend, I was examining the fruit trees in his orchard near the homestead, which, by the way, were showing a clear want of force. Natural conditions for growth were not so favourable as they might have been, and in the shallow medium the long drought of last summer was being felt in its consequences. The farmer was perturbed, because only a few seasons before he had spent a considerable sum of money in planting the orchard, and naturally was hoping for some return. The fate of the trees seemed to hang in a balance, though the case was far from being a hopeless one. A suitable fertiliser was wanting, something to build up and support the trees, and without the necessary material there was a likelihood of them going the wrong way. We passed out of the orchard into the farmyard, and there was the

**HARLOW STATION, G.E.R.**

force for which the fruit trees were pining, running to waste. Cattle sheds and stables extended along the sides of the square yard: a heap of dung was piled up in the centre, and from this and the buildings numerous little streams of coloured liquid trickled and emptied themselves into a kind of pool. This receptacle was full, and from it rich-looking liquid manure was overflowing and running away to strengthen the growth of Docks and Nettles in an adjacent ditch. Doubtless this sort of thing had been going on for some time, and I should not like to say how many gallons of the liquor had run away.

Here was a case of wasted force, and the farmer looked surprised when I told him that the very stuff which was being utilised to strengthen the growth of weeds might be the salvation of his fruit trees. He had never thought of it, he said, and besides the pool was empty in the summer, when the trees were suffering. He did not see the use of watering fruit trees when it was raining every day. I will not weary the reader by repeating the arguments I put forward to prove the difference between watering and feeding the trees with good liquid manure, and to show the advantage of applying the latter even in the winter when growth is dormant. The remarks went home, so far as to the giving of instructions for the immediate emptying of the cesspool on to the ground round the stems of the fruit trees. The wasted force of scores of farmyards might be well utilised in the same way judging by the appearance of the orchard trees in their vicinity.

Another instance, carrying with it a useful lesson, came before my notice at a village flower show last summer. Exhibited in the fruit section was a dish of remarkably fine Red Currants from a cottage garden. They were so much superior to any of the rest that everyone thought that they must be a special variety, and I took an opportunity of questioning the grower respecting them. At first he seemed inclined to think that doubts were being entertained as to whether he had really grown the fruit, and was annoyed on this account, but when re-assured on the point he freely told all there was to tell about the remarkable Currants. He knew there was nothing special about the variety because he had raised the bush himself, and yet the fruit on the one specimen was far superior to that on the rest of the bushes. The man had only one explanation to offer, and doubtless it was the right one. The bush which grew the fine Currants happened to be situated in close proximity to the pigstye, and the liquid manure, draining from it, after being collected in a hole, got poured on the one particular bush! The force in this instance was not wasted, but monopolised; and the horny-handed Currant grower gave me a knowing look when I suggested that it would be well to let a few more of the bushes benefit by the pigstye liquid. It was evident that his mind was already made up on that point, and he had taught himself a useful lesson without being, at the time, aware of it.

Perhaps the best way of turning into a channel of usefulness the wasted forces of a small tree is to lift it, cut back the vigorous roots, and replant in another position; and, with trees too large for this operation, judicious root-pruning is qualified to bring about the same result. To simply cut back the branches of vigorous trees serves no useful purpose, for the force is neither checked nor diverted, as the thickets of rank, useless growth breaking from below the points of cutting soon prove, and the last state of the tree is worse than the first.

Of late years the use of artificial manures has come conspicuously to the front for the growing of fruit. Stubborn prejudices are being worn down, and the value of suitable mixtures is becoming more widely recognised every season. But the man who uses chemical fertilisers should not forget that by unthoughtful application their forces may readily be wasted. Mr. S. T. Wright, the superintendent of Chiswick, is a strong advocate for the use of chemical manure in fruit culture, and his opinion is founded on the fact that for ten years he used nothing else at Glewstone Court, and his success was unqualified. But evidently he observed how force could be wasted by careless application, for in his essay on Commercial Fruit-growing, written for the R.H.S., he says, "The best time to apply these manures (chemicals) is immediately the fruit is set, as it will then assist it to swell and develop into large size. If applied before the crops are set there is still a risk of there being no fruit that season owing to climatic or other causes, and then the manure would force a strong growth, and thus do more harm than good in many cases." Another lesson may be taken from this, to the effect that horticulture knows no set rule, and the man who works by rule without studying the conditions is not long before he errs. It is obvious that all our operations should be

governed by circumstances and conditions and by careful study, so that many forces which are being wasted might be saved or diverted into profitable channels.—G. H. H.

## Bouquet Making: Harmony and Arrangement.

Persons who are not particularly successful at bouquet-making generally assert that there is a "knack" about it which not everybody can hope to discover. I admit that some persons seem to have born with them the knowledge of just what kinds of flowers to use, just how many and just how to put them together. They do not have to learn these things. But that does not prove that there is really any "knack" about the matter. It only goes to show that some persons naturally have good taste—an intuitive taste, we may call it—while others must cultivate taste, or acquire it, in order to do successful work at bouquet-making. Most persons who have a good eye for colour and a sense of harmonious proportion may become able, by a little practice, to do creditable work along this line.

The first thing to do is to learn what colours go well together, and the only way to learn this is by experience. You may read about "complementary colours" and all that, but to know all about them you must see them together. There must be an object lesson, in order to get the idea firmly fixed in your mind by the effect harmonious colours have on the eye. Therefore, try all colours together and find out which you can safely use in combination. These experiments will soon convince you that the line cannot be drawn at positive colours. Intermediate shades and modifications of the primary colours must receive quite as much consideration as the primary colours themselves.

Then the principle of contrast must be taken into consideration. There are contrasts *and* contrasts, and not all contrasts are harmonious ones, you will find. Scarlet and yellow afford striking contrast, but not always a harmonious one. Blue and orange are not discordant, and their contrast is very decided, but it is not a pleasant combination by any means, except in rare instances where strong high colours are depended upon to produce certain results which we would not care for under ordinary conditions. In bouquet-making we find (says a writer in "Home and Flowers") that the most satisfactory contrasts are those by which the use of subordinate colour heightens the effect of the predominating colour. We may often secure this result by using two shades of the same colour.

One colour or shade must be subordinate to the other in importance. They cannot have equal value in the combination without detracting from or entirely spoiling the effect aimed at. Suppose, for illustration of the idea, we have some maroon and white Dahlias to arrange. If we have just as many of one colour as of the other, our bouquet will not please us. But if we have but two or three white flowers among a dozen dark ones, the effect is pleasing, because the contrast afforded by the small amount of white used emphasises the darker colour work effectively. We see beauties in it that we would not see if there was no contrast. Reverse the position and let white predominate. The few dark flowers used make the purity and loveliness of the white ones stand out prominently, as it would not if there was nothing to afford contrast. By these contrasts we secure a sort of background, dark or light, as the case may be, against which to display the predominating colour and bring out the full beauty of it. In every arrangement of flowers there should be some such contrast. Sometimes the foliage of the flowers used will supply all that is needed, but generally the flowers themselves should supply it.

As a general thing, we use a great many more flowers than there is any need of in our floral arrangements. We forget or overlook, if we have learned the fact, that strength is not so much in quantity as in quality. An excess of quantity may produce a weak result. The artist, who paints a picture of flowers which you would be glad to hang upon the wall of your parlour, does not crowd his canvas with colour. He depends upon the effective distribution of it and the use of contrast to bring out the decorative idea fully. I have seen pictures which seemed one great glow of colour, and the careless observer would naturally conclude that the luminous effect was secured by the mass of colour used. But analyse the picture and you discovered that the result was secured by a really small amount of colour. A few Roses scattered considerably against a background of green foliage will give the effect of a great wealth of tone, because all the artistic possibilities have been realised by the combination. Try combinations by which this principle is illustrated, and you will be surprised to see what strong and satisfactory effects are secured by the use of a small amount of material. You will learn from it how to "make a little go a long way." And bear in mind the fact that most flowers are most effective when kept by themselves. There may be harmony in colour without harmony in habit. There are very few flowers which do not suffer by being massed with others.

*Cattleya* × *Wavriniana*, Wigan's variety.

One of the most lovely hybrid Orchids we have seen, having the parentage of *C. Warscewiczii* × *C. granulosa*. Sir Frederick Wigan, Bart. (grower, Mr. W. H. Young), of Clare Lawn, East Sheen, Surrey, staged, and received a First Class Certificate for, the variety which he has appended his name to, and which we figure on this page, from a drawing by Mr. Geo. Shayler. The lip is yellowish at the base but deep rich purple in the front and main area; the segments, which are beautifully turned and curvingly formed, are of a salmon-mauve tint.

#### The Week's Cultural Notes.

It is a far cry yet to winter and its troubles relative to Orchid growing, yet a few thoughts apropos are necessary. Everyone with a few years' experience knows how annoying it is to find the leaves falling from fine specimens of the distichous leaved section, such as *Aërides*, *Saccolabium*, *Vanda*, and *Phalaenopsis*, and now is the time to prevent this as far as possible. In nearly all cases it is the badly developed foliage that falls. Plants not properly consolidated are far more likely to suffer than are those with firm, well developed leaves.

This hardening process cannot be carried out all at once, nor can the plants be exposed suddenly to sun and air, as in the case of *Dendrobiums*. They must be grown throughout in a clear light, with plentiful air currents, but screened sufficiently from sun to prevent scorching. The difference between specimens so treated and others rushed on in heat and shade is very marked; the latter not possessing the stamina necessary to carry the plants safely through the checks inseparable from our dull, sunless winters. The grower who at this time of year lowers his blinds early in the morning, and leaves them down until the evening, no matter what the weather, has no chance against those who watch the weather and manipulate the shading accordingly.

I am not advocating a system of running to the blinds every time a cloud passes the sun, but due watchfulness and care are essential. I may be treading on rather dangerous ground in advising anything approaching atmospheric dryness; but I believe, and have proved, that an hour or so of drying about the middle of the day is quite as necessary to the well being of these Orchids as the moisture supplies in the evening. One helps to consolidate the tissues of the plant, while the other helps to replenish the wasted energies of the plant after the heat of the day.

Extremes in either case are to be avoided, and the habits and likings of individual species considered. No one would think of treating a *Phalaenopsis* of the *amabilis* and similar type exactly as they would a stout growing *Aërides odoratum* or *Vanda suavis*. The sensitive foliage of the former would be seriously injured by the amount of sunshine and absence of atmospheric moisture that would be quite right and proper with the latter more bulky plants. On the other hand, it would be wrong to give the heavy syringings and douches of water in the evening to the Moth Orchid that the *Vandas* and *Aërides* delight in. With the *Saccolabium* a middle course would have to be steered, as the foliage is not so sensitive on the one hand as that of the Moth Orchid, or so vigorous as that of the plants with which I have compared them.—H. R. R.

#### Orchids of Commercial Value \*

(Concluded from page 73.)

The flowers of *Cattleya* are, as we all know, large and very beautiful, and especially *C. labiata* gives us an abundance of bloom almost the year round. The first flowers in the late summer and fall are all of the type *labiata*. This flower is always in demand, and ought to be grown more extensively than it is to-day. Next comes *C. Percivaliana*, with a smaller flower than the preceding one. This species comes in just between *C. labiata* and *C. Trianae*, and is therefore well worth growing, but in smaller quantity. *C. Trianae* is one of the most useful, and I think one of the most extensively grown of all the *Cattleyas*. With very little forcing it will bloom from Christmas to the middle of March, or even later, when it will be succeeded by the *C. Gaskelliana*. Next in turn comes *C. Mendeli*, closely followed by *C. Mossiae*. When the two last-

named bloom Orchid flowers do not, as a rule, find as ready a sale, and it is therefore well to grow them in smaller quantities. During the rest of the year, July and the beginning of August, we have the gigantic *C. Warscewiczii* (*gigas*) and the *Eldorado*. It will hereby be seen that it is possible to have *Cattleyas* in bloom during the entire year. With the exception of *C. Eldorado*, which must have more heat and moisture than the others, they can all be grown at a winter temperature of 55deg to 60deg. This may go up to 70deg or a little more in the daytime, but necessitates, of course, ventilation in clear weather. It is necessary to employ two or more houses for this culture,

*Cattleya* × *Wavriniana*, Wigan's variety.

thereby making it possible to force on or hold back certain plants for certain occasions, and also to prolong the blooming period of each species.

The *Dendrobiums* provide us many beautiful species worthy of general culture for the trade. *D. formosum* and *D. Phalaenopsis* are two of the best warm house species. The first named, not unlike a large white *Cattleya*, blooms during the fore part of winter. The other one, with smaller, white, pink, or rose-coloured flowers on long stems in rich profusion, blooms from October to May. It pays well to grow these two varieties in large number. *Dendrobium Wardianum* with its white, yellow, brown, and rose-coloured bunches of flowers, and *Dendrobium nobile*, with rose-coloured blossoms, are two very distinct, useful, and desirable kinds. They need very nearly the same treatment—lots of heat and moisture during the summer, and a cool and dry place during their resting season in winter. Those four are the best and cheapest for commercial purposes, although there are lots of others which may be grown with profit, for instance, *Dendrobium crepidatum*, *crassinode*, *Devonianum*, *densiflorum*, *fimbriatum*, *thyrsiflorum*, and others.

*Vanda coerulea* is very useful for winter cutting, producing long branched flower stalks, with delicate lavender-blue flowers. Because of its colour it is very valuable for commercial purposes,

\* Read by Robt. Karlstrom before the Hartford (Conn.) Florists' Club, January 28, 1902.

it being the only one of that shade. The temperature in the *Cattleya labiata* house is just right for the *Vanda*, which succeeds best if planted in baskets suspended from the roof—thereby also economising in bench room, so well needed for other things.

*Laelias anceps*, *autumnalis*, and *albida*, all Mexican species, are rich flowering saleable sorts, which can to advantage be grown in baskets. They demand a moderate temperature, and therefore succeed well in the coolest part of the *Cattleya* house.

*Cymbidium oburneum* gives a fine white flower of good substance and form, and blooms in rich profusion. No doubt this plant will become very valuable when better known. It has not yet been grown commercially to a very great extent. It wants a moderate, airy temperature, and plenty of moisture about the roots.

*Cœlogyne cristata* is a very fine white flower with a yellow centre. It is said of this Orchid that it has not given full satisfaction. My experience has been that if grown rather cool and not allowed to become too wet it will bloom freely, and its right place is with the *Cypripediums*. It is valuable for table decorations, and keeps, when cut, for a long time.

The *Phalænopsis* family contains several splendid species, all worthy of commercial culture, and pay well when a warm, moist, and in all respects suitable house is provided. *P. Schilleriana*, *P. amabilis* and *P. Stuartiana* are among the best.

*Lycaste Skinneri* is the best of its class, and good for the local market, but easily spoiled in packing. Because of its easy culture it has been called the "amateur's favourite."

*Odontoglossum crispum* gives us the most varieties for the commercial market, and is, therefore, the best. I am sorry to say that this noble species has often been found difficult to handle. It grows well on a very high elevation of the Andes, where the atmosphere is cool and damp, and seldom rises above 60deg Fahrenheit. Thus its natural climate is hard to imitate, and the plants, therefore, suffer from our hot summers. It is clear that a special house should be provided for this species. Face the house north, shade it from the sun, keep it moist with low temperature, and your plants will succeed admirably. *Odontoglossum grande* is another good kind, with very large yellow and brown flowers. The market for this *Odontoglossum* is, as yet, limited to a certain extent, but it is worthy of culture for variety. *Miltonia Roezli* is a very desirable sort, for which good prices are obtained. It wants lots of moisture about the roots, and a warmer temperature than the majority of its relations. The flowers are very large and effective, almost pure white, with purple and yellow towards the bottom.

*Oncidium varicosum* and its varieties are all good fall flowering kinds. The flowers are produced on long overhanging branch shoots, not unlike a gigantic *Adiantum* frond. *O. splendidum* and *tigrinum* are valuable for the late winter months, with their large yellow and brown flowers. They will, like *O. varicosum*, do well together with the *Cattleyas* during their growing period, but want a long rest in a cool house when their flowering period is over.

*Cypripediums* are easier to propagate by division and seeds than most other Orchids. We have at the present time only a few varieties of commercial value. *C. insigne* (one of the best), *C. barbatum*, *C. callosum*, *C. Boxalli*, *C. villosum*, and *C. Lawrenceanum* are among the best. Here is a great field open for the thoughtful and skilful hybridiser, who may be sure of success. This belief is based on results already obtained in hybrids like *C. Harrisianum*, *C. Leeanaum*, *C. superbum*, *C. Morganiae*, *C. Clinkaberryanaum*, and lots of others. Some of these hybrids are costly in themselves, but nevertheless can always be had at a moderate price, and after a few years hundreds of growths may be obtained at little trouble and small outlay.

A noted Orchid expert once exclaimed: "Just fancy a house full of *Cypripedium Morganiae*"—which is a cross between *C. superbiens* and *C. Stonei*. Just think of it, with its long robust stems, each one crowned with three or four indescribably beautiful flowers, and that will give us some idea of what might be accomplished with this more than interesting genus.

Although most of our Orchids, with a very few exceptions, may be grown in almost any greenhouse, it is claimed by Orchid experts that a full span house from the north to the south is best. It should be constructed so that the water from the outside may easily run off, and all drop by condensation during the winter prevented. Three-quarter span houses to the south are sometimes used, but they become too hot, and more ventilation must be given. This, in turn, exhausts the moisture so necessary for successful Orchid culture.

In conclusion, and in this connection, I wish to say to the retail florist: Do always try to keep a few Orchids in a conspicuous place in your store, and show them to your customers, and by having different kinds from time to time, I am sure the public in general will soon become interested, and you will build up a trade equally profitable to yourself, the grower, and the flower-loving public.

## Nature-Study.

A Nature-Study exhibition has been arranged and held in the Royal Botanic Society's garden in Regent's Park, London, since Wednesday, July 23, and continues till Tuesday, the 5th of August. The exhibition was opened by the Duchess of Devonshire, amid a large attendance; among those on the platform being Lord Avebury, Sir J. Hutton, Mr. Hobbouse, M.P., Sir J. Cockburn, Professor Geddes, Professor J. A. Thomson, Mr. Morrell, M.P., and Mr. Medd (hon. secretary).

"The Nature-Study exhibition," (to quote from the Introduction to the official catalogue) "is the first attempt on a large scale to bring together a collection of objects and teaching appliances which will show the present methods of encouraging children to interest themselves in the life of plants, animals, and other living things which they can find in their neighbourhood. Even in the country, and still more in the towns, owing to the varied distractions of modern society, the eyes of children are apt to wander idly and aimlessly over the realm of Nature. The interest which, as local names show, the country people used formerly to take in birds and flowers has for many years been dwindling away. Children have learnt to look upon the outside world as something to be taken for granted, and less worthy of attention than the contents of a shop window."

"This decay of interest in Nature is not only a detriment to the faculty of observation, it is also a defect in general cultivation. A reader of English literature will hardly appreciate its masterpieces unless he has stored his mind with observations of Nature. How else can he understand the numerous illustrations from nature which give such freshness and charm to the pages of English authors, both in prose and verse? Even the student of science who has specialised in some particular branch finds out sooner or later the value of the varied impressions with which his mind has been furnished by early intercourse with nature."

"To revive the lost or vanishing interest in the surroundings of the child's home is the aim of thoughtful parents and teachers both in Europe and America. The aim is not to teach science or to classify knowledge with the view of pursuing any particular branch of scientific inquiry, but to aid the children to look with care and attention at the life which surrounds them. The eye must be early trained to receive correct impressions of common objects by frequent and repeated inspection. Occasional, hasty, and indiscriminate glances are of little avail, neither awakening interest nor leading to precise observation."

"Nature in this aspect is not divided into separate and isolated compartments of study, but, on the contrary, each object is considered as a part of all nature, and special attention is directed to the dependence of each part upon others. For this reason many authorities are anxious to cancel the use of the word science in connection with Nature-Study, not because there is any room for careless or inexact treatment of these simple observations; but because, while the aim of science is knowledge of a special branch, the purpose of Nature-Study is to awaken the interest of children in a world outside themselves, and to help them better to understand their own place in nature and the conditions of healthy life."

"Although Nature-Study is no new discovery of the present time, the progress of science has suggested to the teachers of it many new methods of instruction. Those who desire to see for themselves what progress has been recently made in this branch of school work will find in the Nature-Study exhibition an unexampled opportunity. Teachers have met the invitation to contribute specimens of their studies in nature with a readiness for which the committee have reason to be deeply grateful. The exhibition includes examples from all types of educational institutions in Great Britain, and also the Colonies and the United States."

Since the opening of the exhibition (notes of which we append) a Conference has engaged the attention of a number of leading educationists, eminent naturalists, and the heads of rural schools and colleges. At the first day's Conference on July 24, the Right Hon. R. W. Hanbury, M.P., President of the Board of Agriculture, presided, and Lord Avebury read a paper on

### "The Study of Nature."

We lived, he said, in a beautiful world which it was fatal to misunderstand. We had all met persons with a university degree who thought that corals were insects, whales fish, and bats birds, and still believed that the world is less than six thousand years old. University authorities seemed to consider that the elements of science were in themselves useless, yet it was important to know the rudiment of all sciences, and it was in reality impossible to go far in any one without knowing something of several others, and so far as children were concerned it was a mistake to think of astronomy and physics, geology and biology, as so many separate subjects. For the child nature was one subject, and the first thing was to lay a broad foundation. Specialisation should not begin before sixteen at any rate. He would then submit

that some study of nature was an essential part of a complete education. In the study of natural history we should proceed from the general to the particular; collection should be encouraged, but it was only a means to an end, not an end in itself. It was like a library, necessary for study, but useless unless studied. If pets were kept, they, too, should be observed. Then as to plants, how many problems were opened up by flowers, leaves, and seeds? There must be causes for the different forms of leaves. What were they? The late Lord Derby used to say that considering the marvellous discoveries of the last hundred years we could not expect so much in the future. With our improved instruments he expected more, as we had, moreover, more students, and the opportunities for research had become

*Hedera Helix tessellata.*

A beautiful Ivy for walls.

more numerous. Everything is full of interest to those who had eyes to see. In the troubles and sorrows of life science could, and would, do much to soothe, comfort, and console.

#### County Council Action.

Mr. H. Hobhouse, M.P., spoke on the question of "How the County Councils may encourage Nature-Study." The best work they could do was in the training of the teachers. He pointed out that twenty-two County Councils conducted short special courses for teachers, extending over a few weeks in the summer; twenty-four had instituted longer and more systematic courses; twenty-six had arranged in connection with these courses outdoor rambles; twenty-five had courses in horticulture, twenty in botany, twenty in natural history, fourteen in plant life, nine in entomology, and seven in zoology. In almost every case the instruction was given at agricultural colleges or in central positions. A great deal more would have to be done and peripatetic teachers might be provided. School gardens and museums should be organised. Apart from the general educational value of Nature-Study there were certain practical ends which might be kept in view, such as the protection of wild birds. Great ignorance prevailed as to the appearance, names,

and habits of birds even in rural districts, and classes could be held at convenient centres, to which he added, with a smile, "farmers and gamekeepers might be specially invited." No less practical ends were the prevention of the diseases of animals, the protection of trees and garden plants from injurious insects, the effects of different soils and manures on various grasses, and the habits of bees and poultry. Other papers on the same (first) day were read by Professor J. A. Thomson (Marischal College, Aberdeen) on "Seasonal Studies in Natural History"; and by Mr. H. Coates on "Local Museums as Aids to the Teaching of Nature Knowledge."

#### Nature-Study in Elementary Education.

On Friday, July 25, Lord Strathcona presided at the second Conference. In Canada, he said, they were fortunate in having a gentleman who was greatly interested in and had done much for education. He referred to Sir W. Macdonald, who had given not less than £750,000 for the promotion of education. Not content with giving that large sum, when he came to understand the wants of the rural districts, Sir W. Macdonald gave further generous amounts for the purpose of Nature-Study. In that he had associated with him Professor Robertson, the Dominion Commissioner of Agriculture. In educational matters we had been going too much in the old grooves and not doing enough to lead the youth of the country to study the things that lay around them. Lord Strathcona went on to speak of the great progress in Canadian agriculture owing to the education now given on that subject.

Professor C. Lloyd Morgan, Principal of the University College, Bristol, delivered an address on "Nature-Study in Elementary Education." Their object, he said, was general, and not special. It was, as Sir George Kekewich stated, the opening of a field for the exercise of the brain and the eye, and it developed a love of nature and an interest in living things. Teachers could do much in this direction, but he warned them of the danger of endeavouring to inculcate general laws and principles which were beyond the capacity of a child.

Mrs. Franklin, hon. secretary of the Parents' National Educational Union, read a paper entitled, "How to Bring Children into Touch with Nature." "Nature-Study in Urban Schools," by Mr. H. Major, inspector to the Leicester School Board; "The Teacher as an Observer," by Miss Mary Simpson, Yorkshire College, Leeds; and "Trees as a Means of Nature-Study," by Mr. John Evans, one of His Majesty's sub-inspectors, were the titles and readers of subsequent papers. On the motion of Sir Joshua Fitch a vote of thanks was passed to the readers of the papers.

We herewith print the programme for the three concluding sittings:—Tuesday, July 29. Chairman: The Lord Balfour of Burleigh, K.T., Secretary for Scotland. Address on "Visual Instruction" (illustrated), by Prof. Bickmore, Natural History Museum, New York. Selected speakers: "Nature Study in Relation to Rural Pursuits," Mr. G. Herbert Morrell, M.P.; "The Proper Attitude of the Teacher," Mr. A. D. Hall, Principal, S.E. Agricultural College, Wye, Kent; "Nature-Study in Elementary Schools from the Teacher's Standpoint," Mr. G. H. Rose, Head Master, Caterham Board School.

Thursday, July 31. Chairman: Sir George Kekewich, K.C.B., Secretary to the Board of Education. Address on "Nature-Study in Colleges and Higher Schools," by Prof. Miall, F.R.S. Selected speakers: "Nature-Study in Girls' Secondary Schools," Miss Mary Gurney, Member of the Council of the Girls Public Day School Company; "Plant Life as Nature-Study," Mr. Scott Elliott, West of Scotland Technical College, Glasgow; "School Gardens," Mr. T. G. Rooper, H.M.I.; "Geology as a Branch of Nature-Study," Prof. Grenville Cole, Royal College of Science, Dublin.

Friday, August 1. Chairman: The Right Hon. Sir W. Hart-Dyke, Bart., M.P. Address on "The Training of Teachers in 'Nature-Study,'" by the Rev. Canon Steward, Principal, The Training College, Salisbury. Selected speakers: "The Relation of Nature-Study to School Work and to the Home," Sir Joshua Fitch, LL.D.; "Nature-Study as an Element of Culture," Mr. M. E. Sadler, Director of Special Enquiries to the Board of Education; "School Rambles and the Training of Teachers," Mr. J. H. Cowham, The Training College, Westminster, S.W.; "The Present Work of the County Councils," Mr. H. Macan, Secretary, Surrey Education Committee.

#### The Exhibition.

The official catalogue of the exhibition extends to seventy-four pages, which may help to convey an impression of the variety and numbers of contributions which have been sent. The exhibits occupy all the available space in the great conservatory, and they further line each side of the long corridor in the Botanic Gardens. Of a mixed nature, all are interesting and instructive. Teachers are there with their note-books; students admire or criticise each other's work; elderly ladies and gentlemen with children go round and find the natural history objects as interest-

ing as a play, and everyone seems satisfied at the success of the new movement.

The Nature-Study Association have brought together many scores of peoples, schools, and societies all with kindred aims and sympathies; it has shown to everybody what everybody else is doing; it has shed through this exhibition many a new idea and many a new plan to teachers and learners, and may very possibly have inspired as many others to make a far fuller use of their time and opportunities. One of the finest features, too, is the presence at the exhibition of publishing firms and trading naturalists who are supplying literature in the one case, and naturalistic specimens for study in the latter instance. We trust their good work in the two sections may be duly rewarded.

The exhibition is divided into groups, Group A, for instance, being devoted to contributions from agricultural and horticultural colleges and schools, experimental farms, agricultural departments of universities and university colleges, and similar institutions. Under Group A the various entries are enumerated. Thus: 1. Board of Education, Whitehall, leaflets and circulars; 2. Board of Agriculture, Whitehall, leaflets on birds, insects, plants; 3. The Yorkshire College, Leeds, which has a large number of objects; and then follow the various other colleges with their displays.

In the horticulture section one finds an interesting group which comprises the parent species of Roses, Carnations, Pinks, and Begonias, backed by their highly developed descendants known to gardeners in the present day. The children's garden plans and diaries are of interest, and show the course of the theoretical and practical instruction given by the County Council lecturers. In the conservatory there are collections of seeds and seed-vessels, shown in pigeon-holed boxes, and many hundreds of dried collections of plants, also drawings of flowers, leaves, stems, and seeds. Many of them are coloured, and most of them are exceedingly well executed. Photographs of children working in the school gardens, and of Nature-Study parties out in the fields and woods, form quite a feature everywhere.

The more elaborate and meritorious exhibits are those of masters and their assistants in the colleges, where model geographical sections of districts, showing the hill-ranges, the streams, the valleys, and all other features to scale, are displayed. In some of the maps the flora and fauna of these islands are shown along with the physical features.

Dried collections of grasses, useful and useless, form yet another feature, and there is ocular demonstration on testing the amount of transpiration in leaves, also on root pressure and assimilation (showing the principle of osmosis), not omitting experiments in growing and feeding plants with and without certain chemical manures. A germinating box with glass sides showed the sprouting methods of a number of different seeds, and a small specimen tree which showed six methods of grafting could not fail to be generally instructive. Prizes and certificates were awarded for plans of gardens, and some splendid work was on view. Add to these, the collections of moths, butterflies, birds' eggs, British reptiles, birds, and hives of bees at work, and it must be conceded that a most successful exhibition has resulted. Thirteen medals and sixty certificates were awarded.

## Birmingham Gardeners' Outing.

The annual outing took place on the 16th inst., and was attended by about sixty of the members and lady friends, the venue being Rangemore Hall, the seat of Lord Burton, near Burton-on-Trent. The weather was all that could be desired. Arriving at Burton about ten o'clock on the Midland Railway, the party was at once conveyed to Rangemore by Bass's Brewery vehicles, specially apportioned for outings. The six miles' drive was much enjoyed, through chiefly Oak-treed pasture land, bearing heavy crops of hay, and the Thorn hedges and bushes charmingly bedizened with Dog Roses and Woodbine in wild profusion. Arriving at the prettily flower-gardened village of Rangemore, a visit to the comparatively small church, a special object contained in it being the identical plain bench-like seat occupied by His Majesty King Edward VII. when visiting Lord Burton in February last. The party then proceeded through the adjacent entrance to the gardens, amidst a multiplicity of flourishing specimens of such as Wellingtonias, Cedars, and other Conifers, Hollies, &c. As Mr. Bennett, the head gardener, was unavoidably absent, his two foremen, Messrs. Culwick and Jennings, were deputed to conduct the visitors through the extensive ranges of fruit and plant structures. The crop of fruit evidenced high cultured skill, as also the plant department; and notable, too, were the hedges of *Rosa rugosa* and climbing Roses.

Tree Carnations were a feature, and are the favourite flower of Lord and Lady Burton. After having perambulated the extensive pleasure grounds an inspection of the principal rooms inside the imposing mansion was much appreciated, and rendered

additionally so by virtue of the King's visit. Returning to Burton, the party, after partaking of a substantial luncheon, visited the famous Bass and Co.'s Breweries, and were conducted by the chief brewers and other officials through some of the various departments. The processes of cork-making were highly interesting, and the now famous mash-tub used by the King was of course an object of lively interest, and the process of washing was minutely described by Mr. Sullivan, the brewer-in-chief, and who had the honour of instructing the King in manipulating the machinery thereof. The visitors were also conveyed by the firm's private train and line to the ale vaults, upwards of a mile distant, and were shown the two cellars containing the vast numbers of casks containing "the King" brew. Though not actually admitted, they were yet seen through the strongly bolted open-barred doors. The visit was concluded by the train extending the tour through the miles of lines connected with other breweries, besides the network of Bass's. Tea was served at one of the hotels, when Professor W. Hillhouse, Birmingham University (the president of the association) proposed that a hearty expression of thanks be conveyed to Lord Burton for the kind privilege granted the party, seconded by Mr. John Pope.

## Disease in *Lilium giganteum*.

We offer the following in answer to "J. P.," who sent decayed bulbs of this handsome Lily.

The stem-root portion was completely rotted, and the roots quite dead. There was nothing observable to the naked eye or even a pocket lens but a few animal organisms, or so-called insects, that are usually associated with decaying vegetable matter. On placing a bit of the decayed root-stem under the microscope, it was found swarming with eelworm in all stages from the so-called egg-sacs, larvæ, encyst, up to perfect form. It appears a species of eelworm closely allied to root-knot eelworm, *Heterodera radicola*, but the mouth cavity appears destitute of the very fine, sharp protrusive boring dart possessed by *H. radicola*, and the ova are not enclosed in the body of the female parent, the cyst, or egg-sac, but scattered irregularly through the tissues of the root, hence cannot be derived from the pear-shaped bodies and motionless forms of pregnant root-knot eelworm.

The eelworm, therefore, found in your *Lilium giganteum* root-stem belongs to a species, the adult females of which are wandering freely within the root, depositing their eggs gradually as they wander about. The larvæ also differ in size and shape from those of *H. radicola*, being short and blunt-tail ended, very closely resembling the root-stem eelworm, *Tylenchus obtusus*. It is the same species evidently that sometimes attacks Banana root-stems, and may occasionally be found in the root-stems of Bamboos.

The eelworm, certainly an unnamed, if not unknown species, has probably found a most suitable host in the root-stems of some monocotyledonous plants, found only so far on those of Bamboos, Bananas, and *Liliums*, yours, as regards the latter, being the first recorded instance, and in this case it was probably introduced along with the bulb or roots. Probably the best treatment would be that of dressing the land some time in advance of planting with basic cinder phosphate, 2lb per square yard, and  $\frac{1}{2}$ lb kainit as advised for root-knot eelworm by Mr. W. Dyke, in *The Journal of Horticulture*, mixing well with the soil and stirring well before planting.

In the case of infested plants, perhaps a mixture of eight parts basic cinder phosphate and three parts kainit, mixed, applying  $\frac{1}{2}$ lb of the mixture per square yard, would have a good effect, it being sprinkled on the surface about the plant, lightly pointing in and afterwards watering, as usual. To encourage growth, a light dressing of nitrate of soda would probably be advantageous, applying 1oz per square yard.

## The Grand Vizier of Uganda at Sutton's.

His Excellency the Katikero (Prime Minister of Uganda), accompanied by his secretary and the Rev. Ernest Millar, who acted as interpreter, visited Reading on the 21st inst. The party was met at the station by the Deputy Mayor and Town Clerk, and subsequently the party were driven to Messrs. Sutton's Trial Grounds, where they were much interested in flowers and vegetables, many of which varieties are now in use in Uganda; and after signing their names in Messrs. Sutton's visitors' book, they attended a luncheon given in their honour by Mr. and Mrs. Martin Sutton in the Abbey Hall, to which a large number of leading members of the Church Missionary Society were invited. After the loyal toasts, the Prime Minister, in a long and most interesting speech, gave an account of the introduction of the Gospel into Uganda as a result of Stanley's first visit, and the subsequent efforts of Mackay and others.

### H.P. Rose Gustave Piganeau.

Either as a bedding Rose or as an exhibition variety, the above has special merits that deserve to be appreciated. In his chapter on "Manners and Customs," Mr. Foster-Melliar in "The Book of the Rose," says it is "Very short in growth, which is nearly the only fault of this very fine Rose. The foliage is good, and the plump fat buds above it open into very large, brilliant, grandly shaped blooms, with broad stout petals, and beautiful centre. Very little liable to mildew, and not much injured by rain. It was a great disappointment when this splendid Rose proved to be a poor grower. Moreover, the plant is not lasting in vigour, but often gets weaker, and is best as a maiden, either on Briar or Manetti. It is very free-flowering, which seems to be a cause of its weakness of growth; it will not make wood, but is constantly forming buds. A good autumnal, capital for forcing, and a large, lasting, reliable exhibition Rose of the first rank." On page 111 we illustrate a typical flower of Gustave Piganeau.

### Wm. Paul & Son's Rose Exhibition.

Away from the dust and the heat of the streets, yet still close to the centre of the metropolis, one could not have imagined a greater luxury during the sun-lit days of a week ago, than to sit and gaze upon the Roses sent by this Waltham Cross firm to form an exhibition for four whole days in Regent's Park. Here were trees for shade, Roses to gladden the eyes, and their fragrance for the air. Ben Greet's Pastoral Players supplied sweet music from the shrubberies.

The Rose tent was large, about 10 yards long and wide, and it betokens the resources of Messrs. William Paul and Son's nurseries, that they should have been able to supply fresh flowers during their occupation there.

The new Frau (can we not call this Mrs. ?)—Frau Carl Druschki, the noble white H.P., was splendidly shown as a pot plant, and seems to have a similar erect habit to Mrs. John Laing. Messrs. Paul's notes on this new comer on page 57 of this journal, must have been read with interest.

Their beautiful Corallina was also displayed, and will become more and more welcome as a decorative bedding Rose. It is of a deep rosy crimson or coral hue, specially beautiful when cut fresh in the bud state, in which condition we know of no Rose to surpass it for bowls or glasses. It is a capital bedding Rose, and blooms freely right into the autumn.

Tennyson, the new Hybrid Tea, was naturally well to the front, and seemed to last through the heat better than a great many of its associates. This Rose is remarkably robust for an H.T., and came, I believe, as a seedling from White Lady. The colour, however, is pale silvery-pink, and the well-formed flowers are very large and prominent. As an exhibition Rose it has promises, and as it becomes longer tried its qualities or failings will assert themselves. The parent of it was excellently shown, and the form of the flowers was perfect. The delicate flesh-tint in the centre of the flowers is very sweet to look upon.

H.P. Violette Bowyer attracted my attention on account of its merits, and also because one so very rarely sees it staged. It is a vigorous Rose which often arrives in a state for showing, and also furnishes a variety for forcing. The colour is white, flushed with pale mauve or flesh-tone. H.T. Viscountess Folkestone naturally found a place, and well deserved it, for it is a first-rate old favourite, and one of the best Bennett ever raised.

Liberty (H.T.) was shown in baskets as a decorative Rose, but as time goes on we begin to see what a splendid exhibition flower it has in hot dry weather. Then it opens strongly with superb form, and large in size, the colour too, of great depth.

Killarney, another H.T., was here of that smooth form which is so great a feature of it. The wonderfully delicate tints of it—pink with a suspicion of lavender or lilac—are very pleasing, and when cut in the half-opened state, Killarney furnishes a strong bloom in any exhibition stand. Beyond that, however, the stamens in the centre become prominent, and it is relegated with "decorative" sorts. In this section it has a great future, and as such, it is here recommended.

Sunset, with lovely clusters of apricot-coloured blossoms, adds another to the decoration class, and it is a vigorous Rose. It resulted as a sport from Perle des Jardins.

Among H.P.'s we still have few exhibition or border Roses that surpass Pride of Waltham, which was sent out twenty-one years ago. The flowers are large and full, and much prized for their delicate flesh-colour shaded with bright rose—a clear and

distinct flower. No less it is noted for the vigour and hardiness of its constitution. In Scottish gardens it is much appreciated.

A new bedding Noisette named Floribunda could not be overlooked, its white and Apple-blossom tinted clusters of flowers being as fair and beautiful as the best. These are also of goodly size and fine shape, freely profused. In the new Sulphurea, sent out only last year, a "yellow" Rose is added to the short list in this welcome colour. The flowers are a true primrose colour; and as a bedding sort it has been described as "a fine thing."

Beside it was Corona, yet another novelty in H.T.'s with regularly formed flowers, of a rich rose-pink like the blossoms of Rivers Early Peach. It fades to a pearly white when fully expanded.

Clio gives a deeper toned Hybrid Perpetual Rose which the Journal has already described as a "sterling novelty," and our longer acquaintance with the variety confirms an earlier judgment. As an all-round and vigorous growing variety Clio is of a beautiful flesh-colour, a colour always admired, and the fine globular form is only another of many merits. It was splendidly staged at Regent's Park.

While one might go on choosing and describing others of tried quality, sufficient has been already noticed to convey an idea of the exhibition in regard to its novelties; and when we add to these specimen plants in pots of Crimson Rambler and the new climbing Leuchstern (Bright Star) with its pink and white Hawthorn-like clusters, together with delightful trusses of the species and other garden Roses, it will be conceded that a fine collection was arranged. Many of the best Roses, better known than those now named, were on view, and Bougainvilleas in pots occupied the top central position in the tent. In recognition of Messrs. W. Paul's efforts, a large New Gold Medal was awarded to them.—J. H. D.

## English Dahlias.

The following excellent paper by Mr. T. Pockett, on Dahlias exhibited in England, as seen by him during his recent visit to the Old Country, appeared in the "Weekly Times," Melbourne, of February 16, 1902:—

There have been a number of papers written about Dahlias during the last few years, more especially the Cactus types, in which their origin has been fully explained, so I will not attempt to write about the history. It may be as well, however, to say that the present popular kinds are nearly all raised in England. I had, on several occasions, opportunities to have a chat with the most successful raisers and distributors of this beautiful type, and I must admit that the varieties of the last two years' introductions are a decided advance upon those of previous years.

The first show I visited where Dahlias were well represented was at Shrewsbury. Everything appeared to be well represented there, as it is acknowledged to be the largest flower show in the kingdom. Perhaps the best show for Dahlia enthusiasts was the Dahlia Show at the Aquarium on September 17. This contained all kinds of Dahlias, including Cactus, Show, Fancy, Pompons, and also Anemone-flowered varieties. They were undoubtedly a very fine lot, and apart from those shown for competition there were also some wonderfully fine exhibits set up by the various trade growers. I could not have believed that the trade would have put so much time, energy, and forethought into their exhibits had I not seen them myself. I will deal more with the trade exhibits after I have given you some idea of the competitive exhibits.

In the first place, the showing of single blooms on boards is, I am happy to say, being done away with, and other plans adopted, such as showing varieties in bunches of three, six, ten, or showing in vases, glasses, &c. A number of Cactus varieties are shown in bunches of six, so also are the singles; but the pompons are usually shown in bunches of ten. Having wires with the loops properly spaced for the required number of blooms, there is really no difficulty in arranging them. No one who saw Dahlias set up in bunches in this manner would advocate the boards again for Cactus, pompons, or single varieties, but the boards may still be used for the large blooms of the Show and Fancy varieties of the formal types.

The Cactus forms were evidently of the greatest interest, although all the various forms were well represented. Size was not evidently regarded, when judging of merit, and I don't know that any particular form was aimed at, as long as the flower represented was what is known as the true Cactus Dahlia, which must be a flower composed of petals either incurved or claw-shaped. They may be straight, but I am inclined to think that those somewhat claw-like were mostly favoured, so long as the petals were sufficiently tabulated or tubular so that the flat surface was not exposed to view. Varieties that appeared to show the type required were Lyric, Rosine, Imperator, Clio, and Lacio. Another type that is evidently appreciated is the

rather narrow, but nearly straight petalled variety, represented by one of the older varieties, such as Chas. Woodbridge, and also the newer varieties, such as J. W. Wilkinson and Mrs. J. J. Crowe. The blooms set up averaged 6in or 6½in in diameter, and were very uniform in size.

In the twenty-four single blooms, such varieties as Rosine, Loyalty, Innovation, Uncle Tom, Columbia, Mrs. J. J. Crowe, John Burn, Lord Roberts, J. W. Wilkinson were staged. The Clown (a broad petal variety), Arab, Mrs. Weir Fife, Mrs. Carter Page, W. Treseder, Imperator, Lyric, Ajax, Artus, Cornucopia, Clarence, Webb, &c., were also shown. In the twelve, the best were Rosine, Mrs. C. Page, and J. W. Wilkinson. In the six, Ajax and Innovation were the best.

A very nice exhibit was the twelve varieties in bunches of six of each bloom, was drawn through a wire loop, and contained a fair proportion of new ones, such as Spitfire, Gabriel, Ringdove, with Lyric, J. W. Wilkinson, and Richard Dean. In the nine varieties, set up in three of each variety, there were fine blooms of J. W. Wilkinson, Rosine, Mayor Tuppeney, Lord Roberts, Uncle Tom, Mrs. J. J. Crowe, Neviators, Sherbrooke, Loyalty, and Chas. Woodbridge. Other good varieties in this competition were Ethel, J. F. Hudson, Mrs. J. Goddard, Zephyr, Mrs. Carter Page, Jealousy, Mr. Jowett, and Red Rover.

Amongst the new Cactus varieties not mentioned in the above that I noted as being good were H. J. Jones, J. H. Jackson, Sailor Prince, Mrs. Allcraft (the two last I noticed in the exhibit of "Hobbies," Limited).

The Show and Fancy Dahlias were very large, but somewhat wanting in build, as they were in many instances a bit too low in the centre. A very good representative lot was shown in the first twenty-four. They were Purple Prince, New Cannin, F. D. Girdlestone, Daniel Cornish, Wm. Powell, Rebecca, Florence Tranter, Matthew Campbell, Wm. Rawlings, Frank Pierce, Shirley Hibberd, Emin Pasha, Majestic, Muriel Hobbs, Harry Veitch, James Cocker, John Hickling, Geo. Rawlings, Kabreteen, Marjorie, W. Veitch, Mrs. Gladstone, A. Rawlings. Other good varieties were James Vick, J. B. Service, Maud Fellowes, J. T. West, R. T. Rawlings. The best twelve of Mrs. Tranter were the following:—Miss Cannell, Arthur Rawlings, Geo. Rawlings, R. T. Rawlings, J. R. Tranter, W. Powell, John Standish, Shottesham Hero, Henry Beith, Florence Tranter, David Johnson. The singles were very fine, and well set up. The twelve varieties were:—Eclipse, Peacock, Beauty of Lye, Frogmore, Aurora, Victoria, Donald, Casilda, Naomi Tyler, Alice Searle, Columbine, Yellow Ring, Puck. The six contained much the same as the best of those mentioned above. Among pompons in bunches of ten a good representative twelve were Hypatia, Douglas, Snowflake, Galatea, Ganymede, Bacchus, Daisy, Nerissa. Other good ones in the six were Tommy Keith, Ganymede, Darkest of All, and Adelaide.

No doubt one of the finest exhibits in the show was that staged by "Hobbies," Limited. This exhibit covered a table about 60ft long, and about 7ft or 8ft in width. The background was composed of Dahlias and Palms. In front were pyramidal groups and vases, about 4ft or 5ft high, with Cocos Weddelliana and Adiantum. There was also a nice plant of C. Weddelliana placed at the back of each pyramid, while the front was composed of blooms in small glasses. The pyramids were filled with the most telling of the newer varieties. One was filled with Rosine. Another Floradora (same type, but dark), while Artus, Flamingo, J. Weir Fife, Lyric, Prince of Yellows, Innovation, and J. W. Wilkinson were used, each variety representing the pyramid, and, with the addition of the usual varieties, it was the finest exhibit I had seen.

Messrs. H. Cannell and Sons had a wonderfully fine lot, but the exhibit generally was rather formal. The table was 30ft by 6ft, the flowers of Cactus varieties were run in lines. The back line was well raised, and was set up in sprays or bunches of twelve. The next line contained tens; while the third was composed of sixes. This was a mass of colour, rising from 3ft to about 9ft in the centre. The most noticeable varieties were Major Weston, Ajax, J. W. Wilkinson, Lovely, Eynsford, Cannell's Crest, The Clown, Monarch, Progenitor, Sherbourne, and Red Rover. There was a number of other very fine exhibits set up by Messrs. Burrell and Co. There was a large collection of Gladioli at one side of table, Roses at the end of table, and a miscellaneous collection of flowers on the opposite side. Messrs. Dobbie and Co. had a large collection consisting mostly of Cactus and pompons, Red Rover, Ajax, Mrs. Carter Page, J. W. Wilkinson, Imperator, and Wm. Treseder. J. Surman had a nice table of popular varieties of Cactus and pompons, but although effective, the flowers were rather small. Messrs. H. J. Jones, Cutbush and Son, Jones and Sons, and others also contributed.

In the competition for six blooms of one variety, the prize went to a variety, Gaillard, although Ajax and Mrs. J. J. Crowe were very fine. Amongst seedlings and others not previously mentioned, I noticed very fine blooms of Mrs. J. Bishop (very large, but coarse), Spotless Queen, Cannell's Nest, and Mrs. G. H. Mawley (a yellow classed). There was a small showy table by J. Walker, which contained fine Show and Fancy Dahlias.

*Dendromecon rigidum.*

## *Dendromecon rigidum.*

This is a Californian plant, a native of the dry rocky ranges from San Diego to Clear Lake, and found most abundantly south of Point Conception, and on Santa Rosa Island. The flowers are yellow, with all the characters and intensity of colour of a true Poppy. They are terminal on the numerous twiggy branches produced by the straw-coloured older wood. It grows from about 3ft to 8ft in height, with leaves of a bluish colour from 2in to 3in long. The two very concave sepals, like those in most flowers which are members of the Papaveraceæ, fall

after the opening of the flower, which spreads widely in the early hours of the day, but assume a more cup-like form after noon. The two forms are given in our engraving. The plant is perfectly hardy in England, but somewhat difficult to get to succeed. Discovered in California by Mr. David Douglas, it was first grown from seed sent by Mr. W. Lobb to Messrs. Veitch and Sons, Limited, of Chelsea. It is somewhat variable in the character of its leaves, and is undoubtedly a handsome plant when well grown; a valuable feature being the length of time during which flowers are produced. At the present time, after many years since it first came to us, there are only a few plants known to exist in England. The engraving has been prepared from a sketch made at Kew, where a fine plant is growing on the west wall of the Cattleya house.

## *Polypodium Schneideri.*

Hybrid Ferns are uncommon, and when a hybrid arises it is not generally safe to say what the parents are. But in the fine Fern here illustrated, which bears the name of a distinguished practical pteridologist, the parents are authentically given as *P. aureum* and *P. vulgare elegantissimum*, and the seedling offspring shows a manifest blending of the characters of both species. *Polypodium Schneideri* has the hairy rhizome of *P. aureum*; but the leafy portion of the fronds more closely resembles that of *P. vulgare elegantissimum*, and is as finely cut, though they bear traces of the glaucousness of *P. aureum*. When full-grown, the plant presents a bold aspect with a rather dense habit. The fronds attain a length of 3ft. The pinnules are narrowly oblong, with a deeply sinuate margin, and are gently undulated. It was raised at Chelsea by Mr. Geo. Schneider, when Messrs. Veitch had their collection of exotic Ferns there.

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### The National Chrysanthemum Society's Outing.

The members of the leading floricultural society of the United Kingdom, as Richard Dean, its secretary, likes to call it, arrange an annual picnic and visit to some prominent place of interest. Yesterday week, accompanied by lady friends, and numbering over 100, they joined in a trip to Sir Wheetman Pearson's beautiful gardens and estate of Paddockhurst, near Three Bridges in Sussex. The rain which fell during the morning in London must have damped more than the ground and the umbrellas; but one often finds that, metaphorically, while London weeps the surrounding country smiles, and it was so on the Wednesday.

Leaving Victoria Station just after ten in the morning, Three Bridges was reached an hour later, and from there to Paddockhurst the conveyances were brakes, through perhaps the most sylvan parts of this southern county. Tall and straight Larch trees, varied here and there by Oaks, Beech, and Elm, commanded the attention of everyone. And as for Ferns—the common Bracken—why they grow 7ft high! Nor must one forget the brilliant banks of Heather, not the Ling, but Erica Tetralix, which absolutely monopolises every foot of surface not already occupied by its handsome companion Pteris aquilina. The dew drops had not yet been dissipated as the party drove upward in the morning; but the stillness of the beautiful gloaming had stolen down on us in our home-going, the red setting sun illuminating with weird irradiance the depths of the forests as our vision searched backward to their depths. Why did the sun set in the east? For we from the metropolis thought it so, which goes to prove what changes are brought about in a journey of but a few miles.

By noon of the 23rd, the scratch Coronation Eleven (N.C.S.) were in their element, "pinching" runs, "stopping" lateral "shoots," and "cutting" with wonderful skill. How else could they on such a day and occasion? They managed to obtain seventy runs against an eleven from Paddockhurst, and as Mr. W. J. Simpson, the captain, was well satisfied, his team is supposed to have been the same! The performance was creditable, and the local men were but fourteen runs ahead.

Lunch intervened during the play, and it was here that the loyal toasts were given and received, Mr. Thos. Bevan occupying the chair. The healths of Sir Wheetman and Lady Pearson were proposed, and sincere

thanks conveyed through Mr. Wadds, the head gardener, for the kind privileges they had allowed to members of the society on this occasion. Mr. Wadds returned acknowledgment, succeeding which Mr. Moorman proposed "The Visitors," and the response came from Mr. T. W. Sprunt, Mayor of West Ham. Recognitions to the chairman and the society's secretary, proposed by the genial Mr. Witty, terminated the luncheon programme.

The afternoon was now wearing on, and while the stalwarts at the wickets still continued their game, the majority of the visitors quietly visited the delightful gardens, and had the additional freedom of inspecting the magnificent home of Sir Wheetman and his lady. Nor could one tire when once within the walls of this noble residence, adorned as it is with statuary and mural dressing. The attached conservatory, with its lofty Tree Ferns, Palms, and Araucarias, is well equipped for indoor recreation, with tables for games of a quiet but amusing nature.

The views from the south windows are truly magnificent, for the eye can travel over miles of parks and densely wooded highlands, the expansive vista seeming to embrace a splendid valley, which closes in hills at the far horizon. The south front is supported by a tall balustrade terrace, over which one looks to the undulating grassy slopes, closely shorn of their verdure, and

A hybrid Fern, *Polypodium Schneideri*.

down to a coolsome waterpool with Lilies on its glassy surface, and here, too, the scene is capped by the intrusion of an arched stone bridge, the whole standing forward from a background-setting of matured trees and shrubs.

Upon the terrace itself Mr. Wadds has successfully arranged some pleasing colour contrasts in the scroll-beds laid out in gravel, and edged with Box. Through an opening in the dividing wall we ascend the flight of stairs and enter a garden of Roses with massive beds on either side, and marvellously prolific Crimson Ramblers smothering a lengthened series of arches. What a feature it is too! and one eminently worthy of being copied in a hundred other places. The glass ranges are just here stretching backward and variously disposed. In front of the vineries are the Chrysanthemums, all robust and clean. The Vines themselves are bearing well, particularly those in pots, on some of which were seven good bunches. The pots are fitted with zinc collars inside of which is the top-dressing.

Here there is also a fair-sized Banana house with plants in fruit, the glass side walls being screened with *Lygodium scandens* trained erectly on strings. *Acalypha musaica* and *Eulalia japonica variegata* occupy the stage, the red foliage of the former contrasting admirably with the graceful white grass of the other.

The ferny grotto, after the style of Pulham's creations, and possibly executed by them, was a great feature to all, and the more observant did not fail to notice and admire the huge hanging baskets of *Allamanda Williamsi* wreathed with dark green leaves and bright yellow flowers, in the stove. *Oxalis rosea* in baskets suspended from the roof of another house furnished an admirable summer substitute for *Begonia Gloire de Lorraine*, of which there is also a capital collection of young plants advancing. All sorts of decorative greenhouse and stove plants are cultivated with conspicuous success.

Lady Pearson also delights to have houses wholly devoted to one genus of plants, and here you will see *Fuchsias*, all bushy and flower-laden; another of coloured *Caladiums*, followed by *Codiaeums* (Crotons), *Calanthes*, *Cypripediums*, *Cattleyas*, and *Odontoglossums*. Seldom, or never, have I seen better *Calanthes* than those now showing their breaks, and the other Orchids and plants likewise are healthy and promising well. The orchard house trees are very creditable, even though the house is ill suited for the purpose.

Huge and beautifully finished Melons occupy two or three span-houses, and Cucumbers are not wanting. Near the houses, on a higher level, is the long double archway of *Pyrus* in variety seen at this season, when the long slender shoots are full grown, the effect is such that none can help admiring it, though it is not easy to describe the impression in print. The kitchen and fruit garden lie more to the west, and are divided from the ornamental grounds and glass ranges by high hedges. Fruit crops are fair, but the season has been unfavourable.

The home farmstead is built on the most up-to-date plans, and every feature is of the best. It would occupy too much space to detail its parts, however, though that too, might be interesting.

Tea came acceptably at about 5.30, and by seven the brakes were prepared for the home journey. A number of us must needs, however, climb to the summit of the square-built tower, but Providence alone knows how some of the ladies, "fair, fat, and forty" (decidedly adipose and quite forty!) reached the top to tell the tale. 'Twas enough for my attenuated frame to wriggle up that screw-like coil, but the effort was as amply repaid as in climbing the Matterhorn to witness a sunrise over the glaciers. By eight o'clock the little band of pilgrims, having dwelt together in amity for one whole day (!) were securely in the train, and contemplating the success of the outing. Those disposed to philosophise might well have asked whether any ungenerous feeling in reality exists among members or officials of the National Chrysanthemum Society, for truth to tell, the best spirit possible pervades the pic-nics—as it should do.—WANDERING WILLIE.

#### Clydesdale Strawberries.

Just now it might be said that the Clydesdale fruit-grower thinks "in Strawberries," for the season's harvest is at present at its height. While the crop gives evidence of being a fairly good one, it is questionable if such a peculiar season has been experienced since the year 1879. The fruit, so far, has never had that marketable appearance usually looked for in Clydesdale-grown Strawberries, as, owing to the wretched spring and the lack of genial sunshine, it caused the fruit to hang too long in the bud before coming to maturity. Indeed, so small has been the fruit on some orchards that growers have almost been compelled, owing to the low prices obtaining for same in the market, to send it to the preserve manufacturers. Should the later varieties not "swell out" better than the early ones, there must be a considerable shortage from last year of this delicious fruit.

## NOTES

#### Victoria Medal of Honour.

The President and Council of the Royal Horticultural Society have conferred the Victoria Medals of Honour in Horticulture, vacant by the deaths of Mr. G. F. Wilson, Mr. Wm. Bull, and Mr. E. G. Beale respectively, upon Mr. John T. Bennett Poë, Mr. George Massee, and Mr. Henry Cannell.—W. WILKS, Secretary.

#### The Royal Aquarium Sold.

This place of entertainment, in Westminster, has been sold, we believe, to the Wesleyan Methodist Union as a site for a large new church to be erected by them. The Royal Aquarium has been the exhibition place for the National Chrysanthemum Society's shows for many years, and for two years the National Sweet Pea Society had held an annual exhibition there, besides which there have been Dahlia shows and other horticultural meetings within its walls.

#### Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, August 5, in the Drill Hall, Buckingham Gate, Westminster, from 1-5 p.m. A Silver Flora Medal will be offered for the best collection of Cactaceous plants, open to amateurs. For other prizes, address Mr. Blogg, 65, Brighton Road, Croydon. A lecture on "Small Fruits from a Private Garden Point of View" will be given by Mr. J. Smith, V.M.H., at three o'clock. \* \* At a general meeting of the Royal Horticultural Society held on Tuesday, July 22, thirty-three new Fellows were elected, amongst them being the Countess of Kingston, Lady Mary Morrison, Lady Stradbroke, and the Right Hon. A. H. D. Acland, making a total of 859 elected since the beginning of the present year.

#### The Neill Prize in Horticulture.

Mr. David Murray of Culzean, who has just been awarded the Neill Prize by the Royal Caledonian Horticultural Society, is a well known and highly esteemed horticulturist, who began his gardening career at the age of fourteen, and served for a time in Abercainey Gardens, Crief. From there he entered on a three years' term of apprenticeship in Blair Drummond Gardens, and after serving for a time in other gardens he found his way into the gardens of the Duke of Buccleuch at Dalkeith, then in the height of their fame and under the charge of Mr. Wm. Thomson. Here he served through the various departments for six years. David Murray was one of five young men selected by Mr. Thomson to take charge of the Pine Apple department in the Clovenfords nurseries, then just started. After three years at Clovenfords, at the age of twenty-four, he was chosen by Mr. Thomson to fill the post of head gardener to the then Marquis of Ailsa, at Culzean Castle, a post he has held with much acceptance to his employers and credit and honour to himself for the last thirty years. For many years Culzean has been famed for high-class gardening in all departments. In vegetable growing and fruit culture, both inside and out, Mr. Murray is perhaps best known, and he is the raiser of the famous Ailsa Craig Onion. The famed Culzean Curled Kale is also a creation of his. In fruit culture Mr. C. Murray has been most successful. His renovation of old orchards and the lifting of large Apple and Pear trees has been a great success. With indoor fruit his success has been equally satisfactory, and though not now so frequent an exhibitor at the autumn shows, the Culzean fruit has on many occasions taken leading honours at most of the large international shows. No finer example of high-class Grape culture can be found in the country than that which is to be seen, any season, in going through the vineries at Culzean, no light cropping, but heavy, full crops of finely shaped and finished bunches. A hearty welcome awaits the horticulturist who makes pilgrimage to this beautiful place on the Ayrshire coast, for amongst the many qualities of this successful gardener, not the least are his warm heart, his frank and open manner, and kind hospitality. May he be long spared to wear his honours, is the wish of many friends besides an—OLD CULZEAN BOY.

**Snow in July.**

Heavy snow fell on the 23rd inst., on the hills in the north of Scotland. The thermometer was down to 39deg this morning (July 25).—D. T., Esbank.

**Large Rhubarb.**

There can be seen growing in the garden of David Pitt, at Eccles, Kelso, N.B., a stalk of Rhubarb measuring 2ft 6in long; girth at the base 8½in; girth at the top 8½in; length of leaf 4ft; breadth of the same 4ft 8in, and measuring round the edge 26ft 6in.—July, 1902.

**Strawberries at Aberdeen.**

The first of the local Strawberry crop appeared in the market about July 15, or a fortnight later than usual. The crop is a light one. The berries are of an unusually small size when contrasted with the big, juicy, finely-flavoured fruit of a favourable season. The retail prices on Saturday, July 19, ran about 10d. per lb., and wholesale about 8d.—or nearly double the price in ordinary seasons.

**Digitalis orientalis.**

*Digitalis orientalis* has long, slender, self-supporting stems, with very numerous, small, straw-coloured flowers. As in *D. sibirica*, the stems are branching, but it is much dwarfer in habit, elegant and graceful. The height is 2ft to 2½ft. Both are true perennials and perfectly hardy, like *D. ambigua*, not like the ordinary Foxgloves of gardens, which are biennials. For a number of years experiments have been made to hybridise the various biennials with the true perennials to obtain a greater variety of colour, but there is no report on the results, which, however, are, after a number of failures, promising at last.

**A Sweet Pea Outing at Kelvedon, Essex.**

On Thursday, the 24th inst., a party of some sixty persons, including the chairman and committee of the National Sweet Pea Society, and members of the leading metropolitan and provincial seed houses, by the kind invitation of Messrs. Hurst and Son, of Houndsditch, journeyed to Kelvedon to inspect the extensive trial of Sweet Peas being grown by this firm on their seed trial grounds. The party found nearly 1,500 samples of Sweet Peas—many of the varieties being repeated—the collection including all the forms of the Cupid type, and all being in full bloom, an excellent opportunity was afforded for comparing the older varieties of Sweet Peas with the latest novelties. The Cupid types were seen to be generally carrying good heads of bloom, and there did not appear among them that tendency to drop their blooms witnessed in previous years. The cooler and moister weather was probably helpful in this direction. Some of the company devoted themselves to inspecting a very extensive and representative trial of culinary Peas, including nearly a thousand samples, while Lettuces, Onions, Beets, Carrots, Beans, &c., had attractions for others. There were also many samples of flower seeds which well repaid inspection. A word of warm praise is due to Mr. T. A. Newby for the admirable manner in which the numerous samples are arranged and supervised, and the grounds kept. Mr. N. N. Sherwood is in much improved health.

**Cordon Pears Grown under Glass.**

In cold or unfavourable districts it is sometimes more profitable to cultivate part at least of the Pear crop under glass. Noxious vapours too, may have to be avoided, and indoor treatment is then much more satisfactory. The engraving shows a Pear house at Lambton Castle, 324ft long, lean-to and facing south-east. The house is wired 1ft from the glass, and the Pears are planted along the front. Strawberries are grown on shelves in the same house, and sufficient light is afforded for odd plant culture beneath, though this is better avoided where practicable. No fire heat has been found necessary, early closing on sunny afternoons being sufficient. The fruits come into use during August from the following varieties among others: Jargonelle, Beurré Gifford, Clapp's Favourite, and Beurré de l'Assomption. In September we have Williams' Bon Chrétien, Beurré d'Amanlis, Beurré Superfin, &c. October: Louise Bonne of Jersey and Beurré Hardy. November: Doyenné Boussoch, Marie Louise and Maréchal de la Cour; other late varieties will continue the supply till springtime. The present is a suitable period for the construction of such houses.

**June Weather at Temple House Gardens.**

In your report last week you omitted to give the rainfall for June, 1902, which was 3.42in, as against the 1.36 for June last year.—GEORGE GROVES.

**Appointment.**

Mr. C. F. G. Candler, for the last five years head gardener at Foxbury, Sevenoaks, Kent, as head gardener at The Kent County Asylum, Chartham, Canterbury. He entered upon his duties on July 7.

**Cyclopedia of American Agriculture.**

Professor L. H. Bailey, of Cornell University, has announced his intention of beginning work at once upon the "Cyclopedia of American Agriculture," supplementing the Cyclopedia of American Horticulture, but differing from it in that it will be a book of instruction rather than a reference work.

**Weather in South Perthshire.**

We still await the advent of summer. Occasionally a warm day has occurred, but generally the temperature has been unusually low, and there has been comparatively little sunshine. On Friday, the 25th, the northern hills were covered with snow, and frost has left its mark on Beech hedges and tender plants. Potatoes are in many places quite blackened. The hay crop is abundant; cereals are promising a good return, but are at least three weeks late.—B. D., S. Perthshire.

**Poppies and Sweet Peas.**

The Sweet Pea is capable of great improvement, and we hope to witness changes for the better in this beautiful and fragrant flower. And with Sweet Peas could not our National Society, which watches the interests of the flower, enlarge its field and include the Poppy genus as one eminently suited to accompany the Sweet Pea in its progress, and worthy also of the attention of trade and private cultivators? The genus *Papaver* yields considerable variety in species, and systematic hybridisation, crossing, and selecting amongst the species and varieties would surely be successful from many points of view, and seems well worthy of being undertaken.

**Carpenteria californica.**

An uncommon shrub, but one that is gradually becoming better known, and more fully grown. In sheltered gardens even in Scotland it succeeds. We have seen healthy specimens at Tynninghame, and at Edinburgh. Yet it is usually regarded as being very tender. On the right hand central page we figure a flowering branchlet, this being the period of its blooming, or in more favourable years, June month. The white flowers are 2in to 3in across, like the white Japanese Anemone, and are borne in racemose cymes. The golden anthers of the stamens too, render the flowers additionally attractive. It loves a light, warm soil, and furnishes a capital pot shrub for a greenhouse. Increased from seeds, layers, cuttings, or suckers, it soon forms a bushy plant, and requires very light pruning or thinning. (See page 107.)

**South African Irrigation.**

The full text is now published of the report on the possibilities of irrigation in South Africa by Mr. W. Willcocks, managing director of the Daira Sania Company, Egypt. It is, he says, fortunate that nearly everywhere in the Transvaal, in the greater part of the Orange River Colony, and over wide areas of the Cape Colony, the rainfall is sufficient in quantity in even the very worst years to allow of the storage of water on a very large scale. On a rough calculation he states that, with the aid of its rainfall and the Orange River, the Cape Colony should be able to ensure the perennial irrigation of 1,000,000 acres, the Orange River Colony of 750,000 acres, and the Transvaal of 500,000 acres in the high-lying regions where Europeans can live and work, and 1,000,000 acres in the low tracts, which should, he thinks, be thrown open to our fellow British-Indian subjects. Mr. Willcocks concludes his report to Lord Milner as follows:—"South Africa, with an additional 3,000,000 acres of perennially irrigated land gained at an expenditure of £30,000,000, and valued at £100,000,000, and also with 10,000,000 acres of land under crops depending on rainfall, which might be valued at another £100,000,000, would be a very different country from that which it is to-day. An addition of £200,000,000 to the permanent wealth of South Africa would enable the country to contemplate with serenity the dark days of its gold and diamond industries."

### Dishes and Baskets for Staging.

I want to make some changes in the way of setting up fruit and vegetables at our show. Could you, or any of the readers of the Journal, give me an idea which are the best sorts of dishes or baskets to use for setting up, say, six Potatoes or six Apples, and where they are to be had? An answer through the Journal would greatly oblige.—J. M. W.

### The Crimson Rambler Rose.

I sometimes hear criticisms passed on this much-grown climber to the effect that the panicles of flowers are small, and that it is often not very showy. When such is the case it is invariably caused by unsuitable treatment. Plants grow so rapidly that they quickly cover their allotted space, and form a dense mass of shoots—if these are not kept regularly thinned. The result is that the panicles of flowers are very much smaller than they should be. To grow Crimson Rambler to perfection it requires good soil and an open situation. The shoots produced are then very strong. These should be thinned to 1ft or 9in apart. Under such treatment panicles of flowers from 9in to 12in are produced of a vivid crimson colour, and one such panicle is far more showy than a dozen small ones, and at flowering time no Rose grown produces a more showy effect. Those who have trees which have become a thicket of growth should thin the shoots severely at once, cutting away the older wood, and leaving the strongest young shoots. Then with plenty of feeding splendid results may be looked for next season.—H. D.

### Gardeners' Bothies.

It is comforting to all ye inmates of, and aspirants to, the chequered life incidental to the bothy, to know that yet another fairly comfortable domicile for young men stands somewhere in the precincts of the celebrated gardens of Nostell Priory. So far as I can infer from the photo, the whole outward features are in the highest degree poetic and provocative of no small amount of sentiment, and that is as it ought to be. But why accuse some, Mr. Easter, for being a trifle sentimental on a question that really never contained but scant measure of that necessary attribute in its composition? I am digressing; let us to the bothy. It looks suspiciously like the conventional back-of-the-wall lean-to-something so often initiating the long line of necessary offices attaching the ordinary garden. It may not be so, but it is sometimes difficult to overcome a first impression, and I do not admire those dreadful prison-like spear pointed railings which circumvallate the bothy and make it dangerous, indeed impossible for the innocents to break in or out, if circumstances should so ordain matters. Then there seems not place sufficiently spacious between the Ivy clad walls and the ponderous ferric palisades, whereon the young men can play a cast at pitch and toss, nor posit a chair to scan the evening news, and fill his lungs of the needful commodity—oxygen—after his ten hours' contact with the depressing influence of carbon dioxide. It also appears to open into the street. This is highly objectionable, if it is so. On the whole it certainly is a passable bothy, if all the up-to-date sanitary arrangements are adequately represented within. The Ivy ought to be cleared, however, from the windows to admit as much air as possible, as I fancy there is not all through circulation of air, if the vallum hortensis forms the opposite wall of the building. As to this indispensability of the bothy attaching to pretentious gardens, I think, the case of Edinburgh Botanical Gardens is sufficient to show that the contrary is equally satisfactory. Here some years ago the bothy system was dethroned, and as far as I am aware, the result was most desirable.—C.H.S.

[We can assure our correspondent from personal experience of Nostell Priory bothy, that it is exemplary both in outside appearance and internally in its arrangements. It is situated on the east side overlooking the fine garden, the fruit and plant ranges being within a very few yards of it. One side is covered with Ivy, the other side with fruit trees. There is no "street" near it, but there is a handsome and typical English park almost adjoining, in which "pitch and toss" could be indulged in; even if not, the slightly superior game of cricket can be enjoyed almost any evening on a beautiful pitch in the neighbouring village of Wragby. The bothy is a good one in every respect.—Ed.]

### Asparagus Beds and Produce.

I must thank you for your most valuable and kindly help when making my Asparagus beds from old Mushroom beds. The produce is quite splendid this season, but being first season for cutting I have taken your advice and cut very sparingly, possibly too much so. I stripped off all the berries last year, but this year it seems to be too thick and heavy to get about. Is it necessary to do this every year? [Certainly best.] My Asparagus realised as much as 4s. 6d. per 120 shoots, and never less than 2s. 6d., in Manchester, which pleased me. I am hoping to put down another acre this year.—CAMBRIDGE.

### Decayed Melons.

I have a large greenhouse full of Melons in full bearing. A number of the plants have borne really very fine fruits, and quite a number have swelled to about 2lb weight. These are partly netted, but have turned yellow and have rotted at the bottom and top of the fruit, and others have a small, hard, green spot, which forms when the Melon "nets," and when the fruit ripens it rots in these spots; otherwise the Melons are perfect, both in netting, colour, &c. Could you or your readers kindly tell me, through the Journal, what is the cause of these defects; and is there any cure for them? I might add that I bought the plants.—"RASPAIL." [See answers to correspondents.—Ed.]

### Sweet Pea, Dorothy Eckford.

At a meeting of the committee of the National Sweet Pea Society held on July 15, no less than five pure white Sweet Peas were shown. These were named White Queen, White Wings, Lily, Purity, and Dorothy Eckford, and all were identical. Each had come with Miss Willmott, and some discussion took place as to which name should be recognised. It was eventually decided that if Mr. Eckford could prove to the satisfaction of the committee that the seeds of the white variety were accidentally mixed with those of Miss Willmott, the Certificate of Merit should go to him as raiser. This Mr. Eckford has done, and the accepted name is Dorothy Eckford. The exhibitors—Messrs. Dobbie and Co., Hobbies (Ltd.), I. House and Son, and Jones and Sons—will, it is hoped, recognise this name, so as to prevent needless multiplication of names.—H. J. WRIGHT, Hon. Sec.

### Gardeners' Education.

The discussion on the gardener's education seems to have lulled a little lately, and I am rather surprised that no champion of learning has attempted to refute the arguments put forward in the interesting letter from the pen of "Domestic Working Gardener," on May 22. I read it over several times, and could come to no other conclusion but true! alas too true! "Domestic Working Gardener" admits that he is not educated. Perhaps not, but he possesses the capacity of being able to state plain facts in plain words. I was also struck with the sensible remarks in the contribution from a "Northern Gardener" on June 5, and agree with him that the pictures of a gardener's life are frequently too much overdrawn. To encourage young gardeners to improve themselves educationally is very commendable, but let them understand the true facts of the case. Place before them the uncertainties and drawbacks of a private gardener's career, as well as the possibilities. I agree with "Domestic Working Gardener" that it is wrong to buoy up the youth of gardening that if they dabble in half a dozen sciences they are ensuring for themselves a good position. Let them learn the sciences by all means, but be honest about the chances a gardener's career holds out.

I daresay other readers of the Journal besides myself ruminate sometimes on the way gardeners are made in these days. In many cases it is merely a process of drift. Few people of even the lower middle class, who are not engaged in horticulture, bring up their sons as gardeners; the chances are not good enough. From what ranks, then, are gardeners drawn? It often happens in this way. A gardener in an establishment in the country is limited with respect to means and facilities; and he has little choice in the way of occupation for his sons. The garden provides a ready, and sometimes the only opening; and so they get started on their way to take their chances with the hundreds who are clamouring for the few plums of the calling. Others have no direct intention of being gardeners at all. When old enough to work they obtain employment in a private garden, just as they might in a factory or elsewhere, and then drift along. There comes the vacancy in the bothy first, then two or three moves to gain experience, and after that a foremanship. It is when the young man reaches the latter status that he realises the uncertainty of his prospects. He may be capable, hard-working, and educated. These qualities will help him, and so also will influence if he is fortunate enough to command it.—G. ASH.

**Carpenteria Californica.** (See page 105.)

## On Fruit: Its Shrinkage.

(Continued from page 511.)

This subject has not received the attention that it demands. It is important to modify the damaging and unsightly effects of shrinkage of fruit if it be practicable. Some of the causes of it, such as early frosts, will probably never be within the fruit-grower's control: too much shade may of itself lead to some degree of shrinkage, but this must be slight, except when the heads of the trees are so thick with branches and leaves as to hinder a free and full circulation of air. Such shade hinders the circulation of juices in the growing fruit, which has much influence on its future perfection. Heavy fruit trees should be trained in forms sufficiently open to admit constantly a full circulation of fresh air, especially when growth is most rapid. Sunlight, by its action upon the foliage, furnishes largely the power that runs the machinery of the fruit tree. The amount of this power that a tree can use in a measure determines how much fruit the tree can bear and bring to perfection. The main cause of shrinkage of fruit is the arrest of growth, the result of insufficient nutrition, and lack of moisture.

### Fruit Trees Need Water.

If the supply of water in the soil in an orchard is deficient when the fruit is maturing, as it sometimes is, even in England, the trees cannot produce a full crop of fruit, nor will the fruit (especially Apples) be properly coloured, however well they may have been fed and otherwise cared for. The lack of a sufficient amount of water in the soil in orchards is often the cause of Apples dropping prematurely, and the proper ripening of late fruits in the autumn. While it may be impracticable to attempt to supply water artificially in most cases, yet much can be done by good management to prevent the needless escape of the natural supply, and in this way large quantities of water may be retained in the soil for the use of the trees when it is needed by them. A mulch of grass, lawn mowings, leaves or other organic matter is useful for this purpose, and the ground in some cases may be cultivated in the open spaces to good advantage. In this connection a protest may be entered against the practice of trimming off the lower limbs of Apple trees. This allows the wind to sweep through beneath them, and the sun to shine in and dry up the soil over their roots.

### Sunlight and Fruit Buds.

Limbs of Apple and Pear trees that are exposed to strong light produce more fruit buds than those which are in partial shade. Florists find that sunlight will bring out the blossom buds for them if their plants are otherwise well cared for, and it appears that it will do the same thing for those who have fruit trees when it is given a chance.

### Orchards Need Manuring.

It is sometimes argued that fruit trees do not need to be manured, and because Apple trees will exist and occasionally bear a partial crop of fruit if they are utterly neglected, it is too often assumed that they require no care after they are planted; but poorly-fed fruit trees can only be regarded from the fruit-grower's standpoint as unprofitable possessions. We have the strongest evidence of the necessity of a high state of fertility for Apples as well as for other crops, and also that the general principles of manuring which apply in the case of vegetable crops, apply to fruits, that is, the essential constituents must be the same. The necessity for their application is found largely in the fact that although an Apple, Plum or Pear crop, &c., is not a very exhaustive one, fruit-growing is really a continuous cropping of the same kind. There is an annual demand for the same kinds and proportions of soil constituents, hence the tendency to soil exhaustion is proportionately greater than where a frequent change of crops is practicable, differing in their requirements, both in respect to the amount and proportion of the essential constituents.

### Kind of Manure to be Used.

A very wide difference of opinion exists as to the kind of manure to use in fruit growing, though stable and farmyard manure is the kind more generally applied than any other form. Apples and Pears are slow-growing trees, and on soils of fair fertility will make a good growth of wood for a number of years, because of their wide root system, and their relatively small annual requirements enable them to gather their food from larger areas and from relatively insoluble sources. Their continuous growth, too, teaches that, under average conditions, the cheaper fertilizing materials that give up their food slowly are, on the whole, more useful than the active and expensive nitrogenous manures; besides, the increased growth resulting from the use of such materials as ground bones, basic slag, superphosphate, kainit, and other potash salts, is more likely to mature well than that from quick-acting nitrate of soda, sulphate ammonia, or guano, which often cause a too rapid growth,

which fails to ripen. Of the essential fertilizing constituents, phosphoric acid and potash should be applied in greater relative abundance than nitrogen. For stone fruits, lime is an essential ingredient. French chemists consider a lime content of one-half of one per cent., an ample supply in light soils, while heavy soils may need 2 per cent. or more. It may be in order to state that the good effects resulting from the addition of lime to such soils do not come only from the addition of an ingredient essential to plant growth, but the mechanical condition of the soil, its texture, water and heat-retaining capacity, &c., are improved, that is, the improvement of the soil is both in a chemical and a physical direction, and one is as important as the other. This same is true in perhaps all cases where fertilizers are applied to soils, a fact which has been generally overlooked until very late, when the study of the physical properties of the soil has received more attention.—J. J. WILLIS, Harpenden.

(To be continued.)

## Scottish Notes.

That our two Edinburgh horticultural associations took a step in the right direction by holding a joint summer show, Wednesday's exhibition in the Music Hall, George Street, afforded abundant proof, and it is to be hoped that as a result fresh impetus will thereby be given towards the making of this midsummer show an annual instead of an experimental institution. It is obvious, however, that in order to make the venture a financial success, fresh measures must be introduced, so as to attract a larger attendance of the general public.

That an extended programme would be a monetary success is of course problematical, but if we are able to secure large drawings at the gates of our football fields on match days, why not be able to take correspondingly large returns from a two-days floral gala? Let this be held in one of our central public parks, such as the meadows, about the middle of the present month, the exhibits to be arranged in marquees. Let a first-class band be in attendance, a large marquee be provided for dancing, and similar provision made for the amusement of young and old. Let the project be liberally advertised, and a request sent to growers explaining the circumstances, and soliciting an exhibit, and there is no mistaking the fact that a successful result could be arrived at, both financially and otherwise.

Considering the unpropitious nature of the weather, the number and quality of the exhibits staged in the Music Hall was highly gratifying. Both trade and gardeners' exhibits of Sweet Peas, Malmaison Carnations, Pæonies, and other hardy border flowers were well staged, and presented a very pretty effect. Roses were not numerous, with the exception of two fine lots from the well-known growers, Messrs. Croll, Dundee, and Dickson, Belfast. Those from the latter place were superb, and for freshness and quality excelled anything I have seen staged in the Waverley Market. Among them were some new seedlings, of which Dorothy and Hugh Dickson were much admired. The Dundee Roses were also good, but showed the effect of having been reared in a colder climate.

Messrs. Cunningham, Fraser and Co.'s exhibit of hardy flowers was a gorgeous display of colour, and included fine seedlings and named Pæonies and Delphiniums, also Inulas, Iris, Erigerons, Scabious, Dictamnus, &c. Carnations were represented in great variety by both Messrs. Laing and Mather, Kelso, and M. Campbell, High Blantyre. Besides Malmaisons, good blooms of varieties such as the following were noted: Goldilocks, Mrs. McNish, junr., Highgate, Voltaire, &c.

Perhaps the most interesting table in the show was one containing Nymphaeas and Nelumbiums; the flowers and foliage were shown in basins of water, and received a considerable share of attention. A glass case containing living insects was also probably worth while examining, but during the few minutes I beheld it, few were to be seen. Mr. McMillan, gardener to Mrs. Currie, Trinity Grove, had an exceptionally fine lot of Pæonies in a wide range of colour.

Mr. George Wood, Oswald Road, was forward with a table of choice foliage and flowering plants, including Clerodendron fallax, Dendrobium suavisimum, Epidendrum vitellinum majus, &c. He had also a branch of Gooseberry Preston Seedling suspended from one of the pillars, and it was truly loaded with large berries. In conversation with Mr. Wood, I learned the origin of this splendid berry, it having been found by a workman in an old quarry about twelve years ago, by whom it was given to Mr. Walker, market gardener, Prestonpans.

A specimen Hydrangea of a blue tinge, carrying over twenty-five blooms, was shown by Mr. John Dewar, gardener to Wm. Currie, Esq., Millbank, Grange Loan. Those enumerated were but a few of the numerous exhibits which filled the hall.

## Societies.

### Royal Horticultural, July 29th.

The following awards were made on the above date:—

*Maranta insignis* (Wm. Bull and Sons).—Leaves about 15in long, 2in wide in the centre, with wavy edges. They are bright green, with olive-green markings. (Award of Merit.)

*Rose Field Marshal* (Wm. Paul and Son).—A splendid new climbing Monthly Rose, rich bright crimson, which we hope soon to figure, and will have more to say about it then. (Award of Merit.)

*Rose Ben Cant* (B. R. Cant and Sons).—An H.P. Rose now well known, and of good general merit. It is of a vivid crimson, with smooth petals of much substance. (Award of Merit.)

*Strawberry The Khedive* (J. Veitch and Sons, Ltd.).—Rather small fruits of excellent flavour and firm flesh. It is rather long and deep-coloured. Parents: Lord Suffield and British Queen. (Award of Merit.)

(See also *Cattleya Waviana* under "Orchids," and *Strawberry Givon's Late Prolific*.)

### Nottingham Horticultural, July 16th and 17th.

The Notts Horticultural and Botanical Society's annual show was held in the grounds of the Nottingham Arboretum on Wednesday and Thursday, July 16 and 17. The opening was under more favourable conditions than the previous year, when it rained heavily on both days, resulting in a great financial loss. The attendance at this year's show has been a record one, and will greatly help the society's exchequer. Owing to the lateness of the season, the entries for outdoor fruits and vegetables were much under the average, but, on the other hand, Roses were at their best, and were shown in great abundance and of exceptional quality. A leading feature was the tables of Roses (6ft by 4ft) arranged for artistic effect, the result being very pleasing, breaking the monotony of the almost endless display of Roses on stands.

A rather novel feature was the fireplace decorations, real fireplaces and overmantels being used. The competition was strong. Most of the decorations were rather overdone, and heavy in effect in consequence. The large groups of stove and greenhouse plants were well represented. Mr. G. H. Turner, of Littleover House, Derby (gardener, Mr. Thompson), secured first prize, together with a Silver Cup offered by Lord Henry Bentinck, M.P. He had a well balanced and artistically arranged group, in which highly coloured, single stemmed Crotons were the leading feature. The second award was secured by Mr. W. Vause, Leamington; and the third, by Mr. W. Artindale, of Sheffield. In the smaller groups we found the class arranged by the committee for the benefit of single-handed gardeners not quite so well supported. The first prize, together with a Silver Cup offered by the Mayor, was awarded to Mr. R. Halford, J.P., Nottingham (gardener, Mr. John Taylor), the arrangement and general effect being light and graceful.

In the class for a collection of indoor fruits there was very limited entry; first, however, was secured by the Earl of Harrington (gardener, Mr. J. H. Goodacre), with a well finished collection of fruit, including Peaches, two varieties; Nectarines, two varieties; Apples, two varieties; Grapes, two varieties; Pine-apple, Figs, and Melon, the collection being backed up with trees in pots loaded with their respective fruits. The second prize was secured by the Earl of Carnarvon, Bretby Park (gardener, Mr. J. Reed).

The following trade exhibits received the society's Gold Medal for excellence:—Mr. H. Deverill, Banbury, for a collection of herbaceous flowers; Messrs. Dicksons, Limited, Chester, for ditto; Mr. J. H. White, Worcester, for ditto; Mr. W. L. Pattison, Shrewsbury, for Violas. A Silver-gilt Medal was awarded to Mr. C. Holden, Hinckley, for a collection of Sweet Peas.

### Wallasey (Cheshire), July 23rd.

Owing to the enthusiasm and generosity of the inhabitants of this delightful Cheshire suburb, the committee, in addition to a Chrysanthemum show, have, for the first time, been able to present their subscribers with a summer show also. The Central Park, where the display was held, was at one time the famed private residence of the district, and although much opposition was raised at the time, no one surely can regret that the District Council purchased so valuable a site for a public park. The exhibits were staged in a very large marquee, and were of uniform quality throughout, the great centre of attraction being the superb boxes of Roses sent by Messrs. Alex. Dickson and Sons, Newtownards.

Mr. H. Middlehurst's Sweet Peas were much admired, as was the group of Carnations in pots from Mr. T. Raffles Bulley, of Higher Bebington, all of which received certificates. There were four groups of plants arranged for effect, the winner being Mr.

Grindley, gardener to Mrs. D'Arcy Blackburn, Poulton. Mr. H. Ogden, West Derby, was second; and Messrs. Fullerton third. Throughout the stove and greenhouse classes Mr. Grindley was well forward.

In cut Roses and herbaceous plants Dr. Bell, St. George's Mt., New Brighton, and Mr. Raffles Bulley contributed in brilliant style. Mr. Gregory had the best four dishes of fruit, also Black Hamburgh and Muscat of Alexandria Grapes.

Dr. Aldershaw opened the show, which was well attended during the day. Bands of music, Pierrots, and other attractions made merry the scene, and reflected much credit on Messrs. Auchterlonie (chairman), Rooking (vice-chairman), Dale (treasurer), the persevering secretary, Mr. J. Finnigan, and the committee.—R. P. R.

### Cardiff, July 23rd and 24th.

The fourteenth annual flower show of the Cardiff and District Horticultural Society was held on the above dates in the Sophia Gardens, in beautiful weather. The show was formally opened by the Mayor, Mr. F. J. Bevan, supported by a distinguished company. The show itself excelled all previous local exhibitions in all-round merit. The local entries also increase as years go on, and there are more this time than ever before. Notwithstanding the difficulties growers have had to contend with through the lateness of the season, many of the exhibits were of superb quality, which made the competition very keen. How much this continued prosperity is due to the unflagging exertions of Mr. H. Gillett, the genial secretary, and a sound hard-working committee, only those acquainted with the inner working of the society can fully appreciate.

Among so much of interest it was difficult to pick out any for special mention, but the two beautiful groups of flowering plants and foliage plants which formed the central feature of the principal marquee were marvels of beauty. Mr. J. Cypher, Cheltenham, was again the successful winner for the principal prize (group 150ft). The table decorations were of high merit, and tastefully arranged. Roses were in abundance, and some excellent blooms were staged, while Sweet Peas were much in evidence. Vegetables were up to a very high standard, and competition was very keen all through, Mr. H. T. Bastin being the most successful competitor in these classes. Fruit was poor in some classes, and on the whole, not up to the usual standard of previous years.

A centre of attraction was a collection of Japanese Dwarf Trees shown by Mr. Eida, of London, which was one of the chief novelties of the show. Another feature of the show was the competition among affiliated societies, for which Messrs. David Duncan and Sons, proprietors of the "South Wales Daily News," gave special prizes, including a Challenge Trophy and silver bowl, value twenty-five guineas, for the best collection of cut flowers grown in the open air, occupying 12ft by 3ft; and for the best collection of vegetables, 6ft by 3ft. Margam and District Horticultural Society were the successful competitors; St. Hagan's and District, second; Peterstone and Ely District, third.

Awards.—Plants, class 1, open: For four stove or greenhouse plants in bloom, distinct, Mr. James Cypher was a good first. Mr. John Lockyer, gardener to I. C. Hanbury, Esq., Pontypool, second. Mr. B. Carpenter, gardener to W. J. Buckley, Esq., Llanelli, third. For four foliaged or variegated plants, or Ficus, distinct, Mr. James Cypher was again first, closely followed by Mr. W. Carpenter. For a group for effect (150 sq. ft) Mr. J. Cypher led with a magnificent group, beautifully arranged, Mr. W. Carpenter running a close second. In the classes for twelve and six table plants, Mr. H. L. Bastin, gardener to Sir A. Henderson, Bart., Farringdon, Berks, was first in both classes; and Mr. Geo. Wall, Llandaff, second. Roses were all splendid. For twelve distinct, in trebles, Mr. R. Crossling, Penarth, was first; The King's Acre Nurseries, Hereford, running a very close second. In the other six classes for Roses the principal prizewinners were Mr. Stephen Treseder, Cardiff; J. Townsend and Son, Worcester; King's Acre Nurseries, Hereford; Mr. R. Crossling, Penarth. For six Carnations and six Picotees, distinct varieties, Messrs. Blackmore and Langdon, Bath, came first; and Mr. A. W. Pike, Cardiff, second. W. Tuplin and Sons, Newton Abbott, Devon, were first for a collection of Carnations and Picotees shown with their own foliage; Mr. R. Crossling, second.

For a collection of hardy flowers, in varieties, W. Treseder, of Cardiff, was first, and W. J. Stokes, Trowbridge, second. In the class for eighteen vases of distinct Sweet Peas, there were six entries, Messrs. I. House and Son making a good first, and were closely followed by Mr. H. Harris, gardener to Mrs. Jenner, Wenvoe Castle; Hy. Byass, Esq., Bridgend, third.

In Division B, for amateurs and gentlemen's gardeners only, for a plant group Mr. G. Wall was placed first, and Mr. W. Carpenter second. Mr. H. Rex, gardener to C. Waldron, Esq., took the lead for a lesser group. Three stove and greenhouse Ferns, Mr. W. Carpenter, first; Mr. W. N. Lawes, second. Some excellent groups of Begonias were staged, and

Mr. W. Metford, of Cardiff, with G. Wall and E. A. Parsons did well. Gloxinias were rather poor, Mr. R. Mathews, of Cardiff, having the best. In the Rose classes, Messrs. M. Febry, A. Townsend, and A. W. Morris were the principal prizewinners. Sweet Peas were shown in great variety, Mr. H. Harris being the most successful competitor, having firsts in each of the four classes. The floral decorations naturally constituted one of the most interesting features, and we found Mr. W. Treseder well in advance in many classes. Miss Jenkins and Mrs. Waldron, amongst others, were deservedly awarded leading prizes.

In the open classes for fruit, the competition was not so keen as in former years. Mr. O. H. Cox, St. Hilary; Mr. C. Curtis, Fairwater; and Mr. H. Gilman, Cardiff, were the most successful competitors with Grapes. For a white flesh Melon, G. Muscott, of Mountain Ash, was first; for a green flesh one, Jos. Greening, of Usk, took first place; and scarlet flesh, W. L. Bastin. In the collection of dessert fruit, six distinct dishes, first W. L. Bastin; second, Mr. C. Curtis. Mr. W. Carpenter was the only competitor for Pine-apples, showing the beautiful Ripley Queen. Apples were well represented, but small, while Peaches, Nectarines, Cherries, Apricots, Strawberries, and Raspberries were also well shown.

Seldom have vegetables of such a high standard ever been exhibited at Cardiff before. For nine kinds, W. L. Bastin was a good first, and was awarded the Royal Horticultural Society's Bronze Medal. Mr. Geo. Shewring was second and Mr. G. Wilkins third. Special prizes were offered by Messrs. Sutton and Sons, Reading; Messrs. Webb and Sons, Wordsley; Messrs. J. C. Wheeler and Son, Gloucester; Messrs. James Garaway and Co., Bristol; and Messrs. Ward and Co.

In the non-competitive section, A. E. Price, of Cardiff, contributed Sweet Peas in vases; while Gold Medals were awarded to Mr. J. Russell, Richmond, Surrey; and Mrs. S. Eida, Conduit Street, London. Silver Medal awards went to Blackmore and Langdon, Bath; R. Wallace and Co., Colchester; Henry Eckford, of Wem, for a good collection of Sweet Peas; Dicksons and Co., Chester, for a collection of hardy cut flowers; and to The King's Acre Nurseries. Messrs. Garaway and Co., Bristol, staged stove and greenhouse plants; and Jarman and Co., Chard, herbaceous cut flowers and Roses.

### Leamington Spa (Warwick), July 23rd and 24th.

This show, which is due to the initiative of Mr. C. S. Birch, was held in the well-known Jephson Gardens, on the above dates. In marked contrast to last year the weather was fortunately fine, and the attendance good on each day. Mr. Birch is to be congratulated on his pluck in continuing the exhibition after the disastrous start (owing to the weather) made last year, and it is to be hoped that a summer show will now be held in Leamington each year. If more liberal prizes were offered for collections of fruits and vegetables, the number of exhibits in those classes would undoubtedly be materially increased. Mr. A. J. Nichols, as usual, proved a courteous and energetic secretary, and he carried out the duties in an admirable manner. The gardens, under the management of Mr. Dell, were in excellent condition, and when illuminated in the evening presented a fairy scene.

**PLANTS.**—Prizes of £10, £5, £3, and £2 were offered for groups of plants arranged in a space not to exceed 150 sq. ft. Three fine exhibitions were staged, and the contest for the premier award was a remarkably keen one. Eventually the judges decided in favour of Mr. Finch, Coventry, the Leamington Nursery Company being placed second. The contest was so close, that it was one of those cases in which the order of merit might have been reversed, and yet have met with general acceptance among those qualified to judge. Personal taste or fancy, however, must generally decide the point at such times. In Mr. Finch's group a rather tall arch formed the centre. This was surmounted by a fine plant of *Phoenix rupicola* as a central object, the arch being draped with light materials, with a few telling plants rising above them. The corners of the group were light and graceful, and from the groundwork elevated plants were raised here and there. Beneath the arch a good plant of *Croton Reidi* showed up to advantage, and a graceful Sugar Cane rose prominently from the groundwork, near which a few Orchids, such as *Oncidium flexuosum* and *Cattleyas* were placed. The whole produced a light and pleasing appearance, but when closely examined the foreground and groundwork were scarcely so well finished as in the second prize group. This exhibit had also for the central object a well formed arch, topped by a beautiful *Cocos Weddelliana*, the whole of the materials being beautifully fresh and well grown. The corners were light and well finished, and yet at no point were they too scanty. A few Orchids and other telling plants rose from the groundwork, and *Liliums*, *Tuberose*s, &c., were also effectively displayed. Beneath the centre of the arch a grand plant of *Dracena Victorice* was arranged, and no doubt if the arch had been slightly taller the effect of the group would have been improved. Through-

out it was noted for thorough finish of workmanship and high quality of materials. Mr. Vause, Leamington, was third with a good, though somewhat heavy display.

For six stove and greenhouse plants, Mr. Blakeway, gardener to Sir A. Muntz, Bart., Rugby, was first with plants in fine condition; Mr. Finch was second; and Mr. Vause third. The last-named exhibitor was placed first for the best specimen in bloom, showing *Statice Butcheri*. He also won for the best specimen foliage plant, showing a good example of *Croton angustifolius*.

**CUT FLOWERS.**—£4 was offered as the first prize for a decorated dinner table. This was easily won by the Leamington Nursery Company with a light and beautiful arrangement consisting of *Cattleyas*, *Odontoglossums*, *Epidendrums*, and that old yet most suitable *Oncidium* for such purposes *flexuosum*. The table also contained some bunches of Grapes. Mr. Vause was second, the third prize going to Mr. R. Greenfield. Messrs. Perkins, Coventry, were first for the best hand bouquet, being closely followed by the Leamington Nursery Company. These two exhibitors occupied a similar position for the best arranged basket of flowers. Messrs. Perkins also won for twelve Tea Roses, and for a like number of H.P.'s; the Leamington Nursery Company being second in each case. Only one exhibit was staged in the class for the best arrangement of Sweet Peas, and the first prize was awarded to Mr. R. Greenfield.

**FRUIT AND VEGETABLES.**—Mr. E. Crump, Leamington, won well for six dishes of fruit (*Pines* excluded), staging grand *Alicante* Grapes, also Strawberries, Peaches, Apricots, Currants, and Nectarines. Mr. W. Draper, gardener to R. O. Milner, Esq., was second. For two bunches of black Grapes, Mr. T. Lloyd, gardener to Lord Willoughby de Broke, Compton Verney, was awarded the second prize; Mr. Draper being first for two bunches of white. Mr. Wright, gardener to M. P. Lucas, Esq., won for a Melon. Mr. Crump was first for a single dish of Peaches, and Mr. Barratt for Nectarines. Mr. Crump also won in the classes for eighteen Tomatoes, and for six, with even, brightly coloured samples. Mr. Lloyd had the best collection of twelve varieties of vegetables, and was also first for six. Although not large they were clean and well staged. Mr. Finch was placed first for a brace of Cucumbers, showing Telegraph.

**NON-COMPETITIVE EXHIBITS.**—Mr. H. Martin, gardener to the Right Hon. Lord Leigh, Stoneleigh Abbey, Kenilworth, exhibited fine collections of both fruits and vegetables, and in each case they were smartly staged. Some of the best dishes among the fruit were fine Muscat and Hamburgh Grapes, Bellegarde Peaches, and Humboldt Nectarines; and among the vegetables, Tender and True Cucumber, Edwin Beckett Pea (grand), Onions and Cauliflowers.

Several well-known trade firms made a conspicuous display, and added materially to the attractiveness of the show. Hinton Bros., of Warwick, staged in excellent style a fine collection of Sweet Peas; Messrs. Harrison and Sons, Leicester, staged a strong collection of Sweet Peas and herbaceous plants. Mr. J. H. White, of Worcester, also made a fine display of herbaceous plants, and a bowl of choice Water Lilies. Another collection of cut flowers was staged by the Leamington Nursery Company; while Mr. Crump staged in good style a large and showy collection of fruit. Each of the above collections were awarded Certificates of Merit. Mr. Greenfield added another first-class certificate to those already gained in London and Wolverhampton for his new *Asparagus myriocladus*. It is perfectly distinct from all other species or variety of *Asparagus*, and should rapidly find its way into every garden of repute.

A glare of colour attracted my attention to one end of the flower tent. Away I went to examine what I thought from a distance to be something particularly good; but oh! the disappointment of it. The exhibit proved to be artificial flowers, scarcely the thing for a summer flower show, thought I. I hope others thought so too.—D.

### St. Ives (Hunts), July 24th.

This is a growing society. In the open classes the competition was very keen at this, the latest show, held on Thursday, July 24, and some excellent produce was placed before the judges. In Class 1, for twelve Roses, distinct, Mr. Seabrooke, gardener to Lord De Ramsey, was first; and Mr. J. Barson, gardener to the Earl of Sandwich, Hinchbrook, second. For a group of plants arranged for effect, first, Mr. Barson; second, Mr. Ebsworth. For six stove and greenhouse plants, first, Mr. Ebsworth. Carnation and Sweet Pea prizes went chiefly to Mr. Seabrooke, and Mr. Hibbeard, gardener to H. Gillart, Esq., Abbots Ripton Hall. For a collection of fruit, not less than six distinct kinds, Mr. Barson led, and was closely followed by Mr. T. Lockie, gardener to A. J. Thornhill, Esq., Diddington Hall. Collection of vegetables: both Sutton's and Webb's prizes went to Mr. Barson, closely followed in each case by Mr. Lockie; third, Mr. Humfris, gardener to Sir Arthur Marshall, Buckden Towers, Mr. Lockie was first with Gloxinias and Tomatoes.

### Newcastle-on-Tyne, July 23rd, 24th, and 25th.

On the above dates this show was opened in the Recreation Grounds, in showery weather. The unpropitious atmospheric conditions were the more regrettable since the exhibition itself was of great excellence. The chief feature of the show was the exhibition of herbaceous flowers, and these were even better than they have ever been before; in fact the judges were heard to remark that they were the best shown anywhere, and were simply perfect.

Roses were again a grand sight, all being bright and fresh.

Limited, Chester; J. Thompson and Son, Forest Hall; Arthur Edwards, Notts; J. W. Barber and Bros., Newcastle.

Competitive Exhibits:—Division A (open to all).—Class 1, for a group of miscellaneous plants; Messrs. F. Edmondson, H. H. Hillier, Thos. Patterson, and G. W. Pinkney, were placed in the above order. For six plants in bloom, Messrs. John Harris, J. and J. Ellison, and S. Bewick. Three Orchids: First Mr. O. Lamb, The Gardens, Wiseton, Bawtry, Notts; second, Mr. J. McIndoe. Gloxinias were well shown. Mr. S. Bewick won with fine plants; Mr. J. Farquharson, second; and Messrs. J. Thompson and Son, third. Dracaenas and Crotons were a very moderate lot. For four single tuberous Begonias, Messrs. Hunter, Harris, and Barwick won; and for four double Begonias, Messrs. Hunter,

H.P. Rose, *Gustave Piganeau*. (See page 101.)

Some very fine Carnations were also on view, and a certificate for special blooms was awarded to Mr. James Douglas, of Great Bookham. The judges were Mr. J. Douglas, Surrey; Mr. Henry Hudson, Cragside, Rothbury; Mr. James Hudson, Gunnersbury House, Acton; and Mr. George Paul, The Old Nurseries, Cheshunt, Hertfordshire.

Competitive exhibits were not so numerous as in previous years. The trade element made a brave show, Messrs. Wm. Fell, Hexham, having an excellent stand of their plant specialities; also J. Robson and Son, Hexham; Mr. John Forbes, Hawick, with a superb collection of herbaceous Ploxes, Pentstemons, very fine, and also Carnations. Messrs. Laing and Mather, from Kelso, again showed fine Carnations, and other non-competitive exhibits were set up by Messrs. T. A. Hutchinson and Co., Forest Hall; F. S. Barron, Wisbech; J. J. Barron, gardener to W. F. Henderson, Esq., Newcastle; W. R. Armstrong, Newcastle; Dicksons',

Henderson, and Wilkinson. Six table plants in 6in pots were well shown—Messrs. McIndoe, first; A. Guymer, second; and J. Bewick, third.

The Roses were one of the leading features of the show. For a collection of these, arranged for effect, Mr. Hugh Dickson was first, and Messrs. D. and W. Croll, second. Both lots were beautifully arranged. Messrs. D. and W. Croll won for the thirty-six with wonderfully bright Roses, their best being Captain Hayward, Mrs. J. Laing, Mrs. S. Crawford, and Marquis Litta; R. Harkness and Co., Hitchin, were a good second, with Mr. Hugh Dickson third. Messrs. Harkness won for the thirty-eight Roses with grand flowers of Earl of Dufferin, Mrs. J. Laing, Mildred Graham, Marie Baumann, Mrs. F. Cant, and Bladud; Hugh Dickson, a close second; and Messrs. D. and W. Croll, third. In the class for twenty-four, H. Dickson won and Messrs. Croll second. There was a grand bloom of Caroline Testout in this stand. For twelve

Roses distinct, the order was Croll, Harkness, and H. Dickson. Twelve of one sort, any variety of H.P., Harkness won with splendid blooms of Her Majesty; Croll run them very close indeed with very fine blooms of Mrs. John Laing; H. Dickson being third. Twelve Roses, any one sort of Teas, first Croll; and Jas. Henderson second.

The herbaceous flowers were a treat to see. For twenty-four bunches (more like sheaves of corn than flowers!) the coveted honours fell to Harkness, of Bedale. G. Gibson and Co. and F. Edmondson were second and third. For eighteen bunches hardy herbaceous flowers the same order was followed. Pansies and Violas were well shown by Messrs. Peacock, Brown Bros., and Battersby, who were the successful exhibitors. Six specimen glasses of Carnations were won by J. Thompson and Son, with O. Lamb and H. H. Hillier second and third.

The table decorations were all very fine. For vase or epergne, Mr. Edmondson was again first; M. Purvis, and O. Lamb, second and third. For a vase or epergne, Orchids excluded, Messrs. T. Battersby, George Webster, and M. Purvis were the victors, and these secured most of the succeeding awards.

Fruit, though not plentiful, was very superior, and in good condition considering the season we have had. For a collection of eight dishes, Mr. Wm. Nicholls won with an excellent collection; J. C. Macpherson and J. McIndoe being close up. Collection of four dishes: The prizetakers were W. Fulford, J. McIndoe, and J. C. Macpherson. For four bunches of Grapes, William Mark, J. McIndoe, and Wm. Nicholls, in this order. Two ditto, Mark, Macpherson, and Nicholls. Two bunches black Grapes, Nicholls, Mark, and McIndoe. One Melon, Macpherson, Fairlie, and McIndoe. Dish of Peaches, McIndoe, Macpherson, and Wm. Nicholls. For a dish of Nectarines, J. Farquharson, Nicholls, and McIndoe. One dish of Cherries, Robert Elliott and J. C. Macpherson. Strawberries were very good, but very few dishes were set up. W. G. Macfarlane was first, J. C. Macpherson second. For a collection of four dishes of fruit confined to gentlemen's gardeners or amateurs within a radius of thirty miles of Newcastle, Wm. Fulford was a good first; T. Cowperthwaite second, and Robert Elliott third.

Coming to the Vegetables, for a collection of eight dishes, Thos. Coxon was first, Wm. Hodgson second, and Geo. Patterson third. Messrs. Sutton and Sons gave good prizes for collections of vegetables. Mr. McIndoe carried off first, Mr. Elliott second and Mr. J. E. Macpherson third. Messrs. Webb and Sons also gave prizes, which were won by Wm. Nicholls, J. McIndoe, and Wm. Hodgson, as placed here. Mr. Robert Sydenham gave prizes for a collection of Sweet Peas in twelve distinct varieties, and a very fine exhibit was furnished. Though small in flower, they were extremely bright and fresh. R. Elliott was first, and J. McIndoe second. The amateurs' classes were well represented, both in the cut flower and vegetable sections.—T. BELL.

### Huyton and Roby, Liverpool.

This suburban show is one of several of importance in the Liverpool district and was held on July 24. Four entered for the circular group of plants, honours being somewhat easily taken by Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby. Choice pot Carnations were very noticeable in the second prize group from Mr. George, gardener to T. Henshaw, Esq., Whitefield House, Roby; and handsome Gloxinias and Streptocarpus in the third, from Mr. Harcastle, gardener to Mrs. Harding, Rydal House, Huyton. Mr. Lyon had the best four stove and greenhouse. Mr. Harcastle brought the three best Ferns, Coleus, and Cockscombs, in superior condition. The single Begonia plants and trusses of Pelargoniums from Mr. Bagnall, Charlewood House, Huyton, were worthy of all praise. Mr. T. Eaton, Roby Mount, exhibited fine culture in his three and single specimen Caladiums, a spray of Oncidium Lanceanum gaining the special prize; also for single Orchid with Cattleya guttata. Roses showed a marked improvement, and the prizes in all three classes were captured by Mr. J. Burrows.

The fruit classes came out very strong, and the quality of a high standard. Mr. Oldham, gardener to Joseph Beecham, Esq., Ewanville, Huyton, won with grand Hamburg and Buckland Sweetwater Grapes, and also for the four dishes, Mr. Eaton coming second. The vegetables and Potatoes from Mr. George were of right quality and effectively arranged, the Tomatoes being equally so.

There were many beautiful table decorations, a somewhat sparse arrangement of Marguerites, blue Cornflowers, and Smilax securing the prize for Miss Crippen. The second prizewinner, Mrs. H. Middlehurst, on the other hand, had been somewhat too lavish in her pretty treatment of Iceland Poppies. Lady Derby's prize for the best cottage garden was won by a local postman, Mr. C. Hambleton; and Mrs. Parrington's for the best allotment by Mr. W. Watkin. Choice cut Roses, Sweet Peas, and herbaceous plants came from Messrs. Caldwell and Sons, Knutsford, and a capital contribution of Sweet Peas from Mr. H. Middlehurst, who, with his assistants, carried out the secretarial duties most faithfully.—R. P. R.

### Handsworth (Stafford), July 25th and 26th.

Brilliant weather ushered in the eighteenth annual floral fête of this enterprising society, which proved to be the most successful yet held. The venue was the Victoria Park. It seems not content to grow by steady progress, but to jump up by leaps and bounds, until it promises to be one of the best exhibitions in the Midlands. In fact, so far is this the case that, as was signified by Mr. Richard Dean, of Ealing, when responding to the toast to the judges at the committee luncheon, Handsworth has now the honour of contributing, in association with Wolverhampton and Hanley, in rendering Staffordshire the only county which can boast of three horticultural shows of importance. Handsworth also promises to increase its importance by offering further valuable special prizes next year.

The opening ceremony was performed by Lady Bateman-Scott, supported by a large number of the vice-presidents and a numerous gathering of the élite of Handsworth. The president, Councillor E. J. Abbott, presided at the judges' luncheon, and the toasts were given by Messrs. W. O. Lewis, T. E. Forsyth, and W. Roberts, vice-presidents. The health of the judges was acknowledged by Mr. Richard Dean, Ealing; Mr. A. Young, Witley Court Gardens, and Mr. R. Jones, gardener to Smith Ryland, Esq., Barford Hill, Warwick. To the courteous and able secretary, Councillor John Edwards, and the assistant-secretary, Mr. Joseph Beresford, high credit is due; including also the treasurer, Councillor W. Roberts.

The trade contributions were a marked feature, with Messrs. Webb and Sons (Wordsley), Jarman and Co., Perkins and Sons, D. Prior and Son, Hewitt and Co., H. Deverill, R. Greenfield, jun., J. Cypher, Yates and Son, R. Sydenham, Simpson and Sons, W. L. Pattison (Shrewsbury), T. B. Grove (Sutton Coldfield), Townsend and Sons (Worcester), and Pemberton and Son from Walsall.

First Division:—For a group of plants (30ft by 15ft); first prize £15, the winner to receive a Silver Challenge Cup. The almost invincible Mr. J. Cypher was first; whilst Mr. G. Hancox, West Bromwich, was second. The third prize fell to Mr. W. Vause, Leamington. For twelve stove and greenhouse plants Mr. Cypher won, and W. Vause followed. Roses formed a leading feature. For twenty-four Roses, Perkins and Sons led with the usual exhibition sorts, comprising Her Majesty (fine), Mildred Grant (good), Marchioness of Londonderry (handsome), and Gustave Piganeau (fine). Second, D. Prior and Son, with a very good lot; and third, J. Townsend and Son, Worcester. For twelve Teas, Prior led; and second, Townsend and Son; third, Mr. J. Mattock, Oxford. For twelve bunches garden Roses, the first honours were accorded Mr. J. Mattock.

Carnations and Picotees were finely staged by Mr. R. C. Cartwright (gardener, Mr. R. G. Rudd), who obtained the first and second prizes for twelve yellow grounds or selfs. For twelve white ground or selfs, Pemberton and Son were the only exhibitors. Violas were extensively and exceedingly well staged, Pemberton and Son, for twelve bunches, being first; and second, Mr. E. H. Cheshire, gardener to Mrs. Marriott. Fuchsias, Zonal Pelargoniums, and Coleuses were all very well shown. These, however, are simple to cultivate. Sweet Peas were a very fine and pleasing feature, and the special prizes were well contested. For nine varieties, the first (a Large Silver Medal and 10s.) was won by Mr. J. J. Canning, gardener to Lieut-Col. Wilkinson, with a very good assortment, tastefully arranged. The second prize (a smaller Silver Medal and 7s. 6d.) was won by Mr. J. Innes, gardener to Mrs. Goode; and third, Mr. C. A. Palmer. The whole of the exhibits comprised the leading varieties. A marquee was devoted to table decorations, which formed one of the most attractive features in the show. Seldom have we seen a more creditable and tastefully arranged set of dinner table decorations, thus rendering the judges a difficult task. Miss Cofta and Mrs. Rose were placed thus for a decorated dinner table. For epergnes, Mrs. S. Rose, Mrs. Overton, and Miss Faulkner won in order named.

Plants, cut flowers, fruits, vegetables, &c., were very well shown in other classes; but the exhibits were too numerous to mention, unless it be the collections of fruit in the open classes. In the class for a collection of ten kinds of fruit, J. H. Goodacre, Elvaston Castle Gardens, led. It may parenthetically be observed that a stated number of kinds of varieties, especially at so early a period of the year, would secure a collection more readily forthcoming, and of higher quality, than when unlimited in quantity. The second prize fell to Mr. J. Read, gardener to the Earl of Carnarvon, also with a royal collection. These were the only contestants. Grapes were in most instances remarkably well shown, but the Muscat of Alexandria would have presented the desirable amber tint if reserved till later on in the season. For six bunches of Grapes (three black and three white), the first prize of £5 went to Mr. J. Read; and second, Mr. Goodacre. They were again the only two competitors. There was a goodly competition for the numerous special prizes offered by the trade for various horticultural products.—W. G.

### Southern Carnation (Southampton), July 29th.

The fifth annual exhibition was held in the Pavilion on the pier, and was a great success. In point of quality the blooms quite equalled those recently staged at the show held in the Drill Hall, Westminster. Taken as a whole, the show here was more representative than that in London, while the competition was exceedingly keen. The principal class for flake and bizarre Carnations was that for twelve varieties, one bloom of each, and five competed for the six prizes offered. Mr. F. Wellesley, Westfield Common, Woking, was distinctly ahead with even sized, clean blooms neatly set up, the varieties being Robert Houlgrave, J. S. Hedderley, Robert Lord, Gordon Lewis (very fine), Sportsman, Master Fred (good), George Melville, Arline, Pandora, George, Thalia, and Admiral Curson. Messrs. Thomson and Co., Birmingham, second with an even stand of smaller blooms; and Mr. J. J. Keen, 37, Avenue Road, Southampton, third.

Six competed for the half-dozen, distinct. First, Mr. J. Fairlie, Rothschild's Bank, City, for a capital set; Mr. E. J. Wootton, 35, St. Catherine's Road, Winchester, a good second; and Mr. W. Spencer, jun., Windsor, a close third. White ground Picotees were admirably staged. In the class for twelve, dissimilar, five competed, the first prize falling rather easily to Mr. F. Wellesley for grand blooms of Ganymede, Nellie, Brunette, Mrs. Barron (very fine), and Amy Robsart. The second place was secured by Messrs. Thomson and Co. with an even set; and third, Messrs. W. Pemberton and Son. Seven competed for six, dissimilar, Mr. A. R. Brown, Handsworth, Birmingham, with level blooms of Fanny Tett, Mrs. Beswick, Myra, Heart's Delight, Lavinia, and Isobel Lakin. Second, Mr. W. Spencer; third, Mr. J. Fairleigh.

Yellow ground Picotees were more largely represented than any other section. For twelve, in six varieties, there were seven competitors. Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, was distinctly ahead with grand specimens, including varieties named in previous reports. Second, Mr. F. Wellesley; and third, Messrs. C. Turner, of Slough. For six Picotees, no less than eleven competed. Messrs. Blackmore and Langdon, of Bath, won with ease the premier position. Second, Mr. W. Spencer, jun.; and third, Mr. E. H. Buckland, Southgate House, Winchester.

For twelve yellow ground and Fancy Carnations, eight competed, Mr. Blick leading with full solid blooms of Author, Andromeda (fine), Cavalier, Lily, Duchess, Hesperus, and others. Mr. F. Wellesley was a good second; Mr. C. Turner, third. Twelve competed for the six, distinct, Mr. E. J. Wootton being first; second, Mr. W. Spencer, jun.; and third, Messrs. W. Artindale and Son. In the class for twelve Carnations, selfs, distinct, six competed; the best coming from Mr. Blick. Second, Mr. Wellesley; and Messrs. Thomson third. So many as eighteen competed in the class for six Carnation blooms, distinct. Messrs. Blackmore and Langdon secured the leading award for a fine set. Mr. A. R. Brown, second; Mr. W. Spencer, third. Single blooms in their various sections were well represented.

**TABLE DECORATIONS.**—For the best decorated dinner table (Carnations and Picotee blooms only) there were five entries, the first prize being easily secured by Miss Wadmore, Brook House, Basingstoke. Mr. R. H. Jeffrey, Nursling, Southampton, was a good second.

Sweet Peas added much to the attractiveness of the show, so well were they displayed. For nine distinct varieties Mr. A. Maple, Aldermoor, Shirley, Southampton, led with huge bunches of finely grown flowers in popular varieties. Mr. R. H. Jeffrey was a good second.

Non-competitive displays were numerous and added much to the variety and beauty of the show. Foremost was a grand display of Carnations and Picotees from Mr. J. Douglas, Eden-side, Bookham, consisting of many choice and new varieties, such as Aleinous, Rayon d'Or, Lady J. Grey, Gnomon, Ormonde, Countess of Verulam, Argosy, Sappho, and Achilles.

Messrs. W. Cutbush and Son, The Nurseries, Highgate, N., staged magnificent blooms of Malmaison varieties, such as Maggie Hodgson, Juliette, Mrs. Trelawney, Princess of Wales, and Gault. Messrs. B. Ladhams and Son, Shirley, had a grand group of eut herbaceous flowers, and Mr. Amos Perry, Winchester Hill, had also an effective display of hardy flowers and Water Lilies. Mr. W. Garton, Woolston, arranged a charming group of Crotons, Begonias, Geraniums, &c., at the end of the large hall, which were much admired.

*We are obliged to hold over a number of Reports until our next issue.*

Cordon Pears grown under glass.

## Obituary.

### Mr. Elijah Draper.

I enclose cutting from our local paper containing the news of death of our esteemed hon. secretary, the late Mr. E. Draper. I believe it will convey to you more than I can express of the esteem in which he was held by all who knew him, and more especially by lovers of horticulture. By his death the Northampton Chrysanthemum Society have indeed lost an able secretary and most sincere friend.—T. HEMMING, Acting Sec. Northampton Chrysanthemum Society.

"Mr. Draper was for many years schoolmaster at St. Giles' Day Schools, and a number of his scholars achieved prominent positions in various parts of the country. Subsequently he conducted a private school at the Working Men's Club, St. Giles Street, and his considerable talents as a schoolmaster were here again exemplified by the successes of his pupils. In March, 1890, he was elected secretary of the Northampton Town and County Benefit Building Society, in succession to the late Alderman T. Adams, and during the whole time he has occupied that responsible position in this large and important society he has proved himself a most capable, courteous, and assiduous officer. In the period since his appointment the membership has very largely increased, and the receipts have been well nigh doubled. In the last report of the directors it was stated that the society now consists of 3,237 members, holding 7,777 borrowing shares and 6,125 investing shares. Notwithstanding the reports of the depressed state of trade in Northampton, it was recorded that every phase of the society's working showed a distinct improvement on the preceding year. Mr. Draper was also the honorary secretary of the Northants Chrysanthemum Society, having always displayed keen interest in the cultivation of flowers and fruit, and much of the success which has attended the annual exhibitions of the society in the county town is due to Mr. Draper's untiring efforts as secretary. In his early years Mr. Draper took a keen interest in cricket, and later, in addition to the pursuit of horticulture, was fond of angling."

## Trade Notes.

### A New Variety of Galega.

Mr. W. Baylor-Hartland, of Cork, sends us an armful of a new variety of Galega officinalis, which he names bicolor. The standard in each of the flowers is deep mauve-purple, the wings and keel being almost white, but tinged with the mauve. It appears to be very robust, with racemes 7in long, and branched. As a border herbaceous perennial it is distinct and meritorious.

### A Twin Brake Hand Hoist.

This apparatus, fully described as Pickering Twin Brake Quick Hand Hoist, will appeal to our home farmers, land stewards, and the gardeners in very large establishments. We are not able to illustrate the hand hoist here, but on an advertisement page a figure is presented in connection with the London Hoist and Machinery Company's notice, whose address is 103, Worship Street, E.C. The latest development of this well-known Pickering Sack Hoist (upwards of 100,000 have been sold) is in the brake shoe and lever being duplicated, so as to render the lowering equally effectual whichever end of lift chain is in use, thus rendering the hoist free from the jerky action common to the old type. A man has only to exert a pull of a fifth of the load, i.e., 56lb, to raise a sack of Corn at the rate of 20ft per minute. The company's catalogue should be consulted.

### West's Aërated Spray Syringe.

The above is an invention by Mr. C. E. West, of Roundhay, well known as a leading garden sundriesman, and its great point of merit is that it will save more than half ( $\frac{1}{2}$  it is said) of any insecticide that may be used when spraying plants. The insecticide being mixed with air by the action of the syringe, a deadly insecticide can be used extra strong, and the particles, floating in the air, envelope the whole plant. It acts on the same principle as a scent sprayer; but is worked like an ordinary syringe. West's Aërated Spray Syringe is, indeed, an ordinary syringe, but with an extra cylinder for holding the liquid firmly fastened to it, and is connected to the cylinder by two tubes. As all syringes are powerful pneumatic pumps, and as the water in the cylinder is connected to the syringe in the same way as a scent sprayer is done, when the plunger is worked in the syringe a big force of air is got which aërates the spray in the same way as a scent sprayer, and thus gives off the same kind of spray. But as the syringe is so many times larger and stronger than a scent sprayer, the syringe gives a much better spray and cannot get clogged up, and the cylinder holds as much liquid to last an hour or so of spraying. It can be also used as an ordinary greenhouse syringe, and being serviceable, it can be used to do all the

syringing in a greenhouse. We are also well pleased with Mr. West's fruit gatherer and tree pruner. This is intended for gathering fruit out of reach, and for pruning high branches. His espalier chain and hooks for supporting Raspberries, Currants, Gooseberries, Tomatoes, Roses, and climbing plants also shows considerable originality, and seems very useful.

## Strawberry, Givon's Late Prolific.

This new late fruiting Strawberry received an Award of Merit when shown before the Fruit and Vegetable Committee of the Royal Horticultural Society on July 2, 1901. The same body raised the award to a First Class Certificate at their sitting on July 22, 1902, when some handsome fruits were again set before

Strawberry, Givon's Late Prolific.

them. The fruits are large, broad at the base, and curve to the shoulders. They are of a bright rich crimson-scarlet colour, firm and even, with a luscious, mellow flavour. It is a first-class Strawberry, and a late and heavy cropper. Parents: Waterloo and Latest of All. From H. P. Sturgis, Esq. (gardener, Mr. W. Peters), Givon's Gardens, Leatherhead.

## Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

### Fruit Forcing.

**CHERRY HOUSE.**—The trees have the wood sufficiently ripened and the buds enough plumped to allow of their being fully exposed to the atmosphere. This applies to the house started early in the year, therefore remove the roof lights, which is the best means for arresting premature growth, to which the Cherry when forced year after year successively is liable. The leaves from their hard texture are not very inviting to black aphides, but red spider will prey upon them unless prevented by syringing or an insecticide. Black aphides, however, may appear on any young growths, in which case syringe the points with tobacco water, rubbing the worst infested parts gently between the fingers whilst wet with the insecticide. For red spider, syringe the trees with paraffin emulsion, adding  $\frac{1}{2}$  oz of sulphide of potassium to 3 gallons of the solution, 2oz of paraffin emulsion per gallon of water being used. The border must not be allowed to become parchingly dry, but have copious supplies of water, and if the trees are weakly, liquid manure may be employed, as poverty of bud-perfecting means collapse of the fruit after setting if it gets beyond the blossoming. Trees in pots may be removed from the house, stood on a base impervious to worms, plunged in ashes in a sunny position outdoors, where they must be duly attended to for water, and properly syringed to maintain the foliage in a healthy state as long as possible.

**CUCUMBERS.**—Any house or frame at liberty may yet be planted with Cucumbers, the frame having a bed of fermenting materials which will give a supply of fruit in September, and continue to do so nearly to Christmas if due regard be had to lining the bed and to protecting the plant by mats over the lights at night after the weather sets in cold. Let the growths of plants in frames or houses be thinned at least once a week, and in growing weather twice, removing exhausted growths to make room for young bearing shoots. Keep the growths well stopped to one joint beyond the fruit, or at the fruit if the plants are vigorous and showing no signs of exhaustion. Always allow weakly plants more extension, and crop them lightly. Maintain a temperature of 70deg at night, 75deg by day, 80deg to 85deg with sun, closing early to increase to 90deg or 95deg. Maintain root activity by surface dressings of turfy loam or lumpy sweetened manure, and pay due attention to watering two or three times a week. Syringe in the afternoon of hot days, but avoid late syringing, for the foliage should be dry by sunset. The autumn fruiters should be planted on hillocks or ridges moderately firm, maintaining a moist and genial atmosphere, and they will grow and show fruit in plenty shortly, being far better for a supply of late summer and early autumn fruits than old plants, which produce knobbed, crooked, and otherwise inferior specimens at that season.

**PEACHES AND NECTARINES—LATE SUCCESSION HOUSES.**—Every attention must be given the trees in syringing to keep the foliage free from red spider and in watering the inside borders. It will be an advantage to mulch the borders with short lumpy material, as stable litter freed from the straw; but it must not be used in great amount at a time in the fresh state, or the ammonia vapour will seriously injure the foliage, particularly if the lights for ventilation are kept close, a little air constantly being a safeguard against scorching, soft and attenuated growth. The value of using manure rather fresh, but not rank, as a mulch, is that the ammonia given out is inimical to insects and invigorating to the plants, the waterings making its soluble constituents available for taking up by the roots, and by being lumpy or open atmospheric influences have freer access for effecting the assimilation of food in the soil than when it is practically sealed by a close mass of little manurial value. The shoots must be regularly tied in, allowing space in the ligatures for the swelling of the shoots. To assist the colouring and ripening of the fruits, they should be exposed as much as possible to the influences of sun and air by removing or shortening some of the foliage where too thickly placed. When the fruit is on the under side of the trellis, the shoots may be untied and regulated so as to bring it with the apex to the light, supporting each fruit in position by a lath placed across the trellis. Discontinue the syringing when the fruit commences to ripen, and lessen the supplies of water, but on no account must water be withheld to the prejudice of the health of the trees. A piece of soft netting, such as hexagon, placed below the trellis, and so arranged as to form pockets to save the fruit from a long run against each other, will prevent any fruit being bruised should they fall. Both top and bottom ventilation will be necessary

constantly, except in cold weather, after the fruit commences ripening.

**LATE HOUSES.**—Continue syringing the trees as often as necessary to keep red spider in check, but avoid keeping the foliage constantly moist. Inside borders must be well watered and mulched, avoid making the soil sodden and sour by needless watering. Tie in the shoots regularly and evenly, keeping them rather thin. Stop any gross shoots, or preferably cut them clean out, thereby causing a division and more equalisation of the sap and vigour throughout the tree. When the fruit commences swelling after stoning, and it being desired to accelerate the ripening of the fruit, close the house somewhat early in the afternoon. Let the temperature rise to 80deg, or 85deg or 90deg, ventilating a little before nightfall. Increase the ventilation early, and keep through the day from 70deg to 85deg whenever practicable. The wood is so unripe in many cases that every possible advantage should be taken of the solar heat, alike to perfect the current crop and the wood and buds for the ensuing season, especially in unheated houses.

**MELONS.**—The weather, broiling hot a short time and then cold from the prevalence of north-easterly winds, has not been favourable to late crops in frames, as keeping close means a moisture-laden atmosphere, and gives Melons on manure beds an impulse in the direction of growth. As the fruit sets badly on luxuriantly growing laterals, the growths should be kept rather thin, crowding tending to nothing but disaster. Air a little constantly to prevent the deposition of moisture on the blossoms, which is necessary to secure a good set, affording no more water at the roots than is necessary to prevent flagging of the foliage. Do not neglect to fertilise fully expanded flowers daily, and to go over the growths frequently for the removal of superfluous and stopping the unruly, or to concentrate the nutriment on the fruits, being careful to avoid overcrowding. Copious supplies of water are necessary to plants swelling their fruits, about twice a week in bright weather, once a week, or more distantly, in cold and moist dull weather. Sprinkle the plants at closing time on fine days, those in houses being well syringed both ways in the afternoon of bright days, and a good moisture maintained by sprinkling the floor two or three times a day, damping being all that is necessary in dull weather. Keep the atmosphere dry when the fruit is setting or ripening. Maintain a top heat of 65deg at night, 75deg by day, in dull weather admitting a little air at that if there be a prospect of some sun, increasing the ventilation with the increasing temperature up to 85deg or 90deg, closing sufficiently early to raise the heat to 90deg or 95deg or 100deg. A free circulation of rather dry air and warm greatly improves the finish and quality of Melons when near ripening. If canker appear at the collar, rub quicklime into the affected part until it becomes dry, repeating as necessary, maintaining a drier and better ventilated atmosphere. If there be any indications of the fruit cracking, cut the vine about half way through a few joints below the fruit, reducing the supply of water at the roots, and maintain a dry well ventilated atmosphere, not neglecting to afford some air at night.—**ST. ALBANS.**

### The Kitchen Garden.

**SOWING CABBAGE.**—From the present time to the middle of August may be considered the best period to make the sowing of Cabbage for spring use. Ground should be well dug over to bury rubbish and provide a broken up surface of fresh pulverised soil which can be made fine and level for distributing the seed upon. Should the soil be very dry, and the weather likely to remain hot and dry, a thorough soaking of water ought to be given. Drills may then be drawn, and the seed sown in them thinly, or it may be scattered thinly broadcast. If the latter plan is adopted, cover the seed with a thin layer of fine, dry soil. Good varieties to sow now are Flower of Spring, Ellam's Dwarf Early, Wheeler's Imperial, Enfield Market, Early Offenham. In continued dry weather sprinkle with water to assist germination and early growth.

**PARSLEY.**—Sowings of Parsley made at different times always ensure that a supply of this much esteemed herb shall be forthcoming. After plants commence to throw up flower stems they are seldom worth retaining, and as the oldest beds are sure to do this, fresh sowings must be made to fill up probable gaps in the regular supply. There may not be much fear of shortage at present, but in the winter and early spring the supply frequently runs short. A bed, however, sown now will make excellent growth during the autumn which will last well through the winter. Sow on a plot of good ground in drills 6in apart. The seedlings are readily thinned by this method, and the hoe may be used between the rows.

**CELERY.**—The earliest rows of Celery may receive a final earthing, seeing before doing so that the roots are thoroughly moist. Apply soil round the plants only when they are quite dry. Successional rows also require frequent attention according to the advanced condition of the plants. The second early rows will most likely require earthing another stage, while the rows to

follow should have a little soil broken down round the plants. Trim away suckers or any useless leaves, and soak the plants with water or liquid manure. A sprinkling of soot or artificial manure will be beneficial. Where Celery has been planted between rows of Peas, the old haulm of the latter should be cleared away as soon as possible.

**PLANTING WINTER GREENS.**—Although the main crops of these are in most cases established and making progress, there may be vacancies in the garden which require filling, and as green vegetables come in exceedingly useful in spring it is advisable to plant freely. The best of the plants from the seed beds or nursery quarters should be inserted, affording them abundance of liquid manure to give them a start. Coleworts can be planted in rows a foot apart, and Borecole of various varieties are useful to plant now, giving them double the distance.

**TOMATOES.**—In warm and favourable weather for the setting and swelling of the fruit frequent attention must be given to the regulation of growth, and duly supplying water to the roots, as well as applications of a variety of liquid manure sustenance. Plants bearing a heavy crop demand considerable assistance other than that supplied by clean water and the soil they are growing in. The liquid obtained by soaking cow, sheep, or horse droppings is suitable, as well as the drainings from stables, cowsheds, or that collected in a farmyard cesspool. Dilute to a safe strength, and give it when the soil about the roots is moist, not dry. Soot water is good as a change, also a solution of guano or artificial manure. Very heavy bunches of fruit should have some support to prevent the stem tearing away. A layer of manure over the roots as a mulching will serve to keep them cool in hot weather.—EAST KENT.

\* \* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**BOOK WANTED** (E. Cooper).—The little book ("Fruit, Nuts, and Vegetables") has no definite address imprinted; but we believe the author (Mr. Albert Broadbent) is to be found at 19, Oxford Street, Manchester. We have written there to inquire.

**GROWTHS OF PINUS DESTROYED** (A. H.).—There was not any caterpillars or "grubs," but some pupæ, or chrysalids and a few moths. The moth is the Pine-shoot Tortrix Moth, *Retinia buoliana*, which are to be found during July and August about young Pine trees of various kinds. The female lays her eggs between the buds at the ends of the boughs. The caterpillars, which hatch late in the summer, gnaw these so as to cause a flow of turpentine that gives them a slight coating, and here the caterpillars hibernate. In the following spring when the trees begin growth the caterpillars attack the shoots nearest or one side of them, and are to be found under a kind of web and turpentine that flows from the wound. The caterpillars are to be found from September to May or June, and on ceasing to feed they change at the same spot to chrysalids or pupæ, the cases of which are brown or brownish yellow, blunt at the tail, and furnished on the abdomen with prickly-like processes pointing backwards. They are to be found in June or July, and in about a month the moths appear. In the dusk of the evening the moths sport round the tops of the young Pines, out of which they have emerged from the pupæ-cases; but by day they rest, and are not easily seen from their similarity in colour to the withered shoots of which they have been the cause. This species of *Retinia* is common wherever Pine trees are to be found, from the north to the south of Europe. As regards remedy and preservation, the keen eye will be on the state of the buds or shoots, and when these show the caterpillars or pupæ to be present the parts should be carefully removed so as not to injure the remaining shoots, and all these infested pieces should be burnt. This will lessen the amount of future attack, and the earlier it is done in the season the better. If pieces of tin, about a foot long and 2in or 3in wide, are smeared with a sticky substance and placed in the outer forks of the branches during July and August many moths would be captured, and it is likely that spraying the trees with Paris green, one ounce to ten gallons of water, at the end of August, and again at the middle of September, would give the caterpillars a final meal.

**MANGOES SOLD IN MARKETS** (Pomello).—The Mangoes you notice in the market reports are not grown in England, but are imported, being grown in tropical countries. Indeed, the Mango tree, *Mangifera indica*, is not often seen in England, though it has been grown and its fruit occasionally brought to perfection. It is a stove evergreen tree attaining to a height of 60ft.

**KEEPING OFF FLIES** (A. L.).—We do not know of any substance that would prevent flies teasing farm or garden hands while at work. In your part of the country midges are often an intolerable nuisance, and though we tried smearing with tobacco juice and quassia extract found little benefit.

**THISTLES AND NETTLES IN GRASS** (Idem).—The best method of eradicating Thistles and Nettles in grass fields is to pull the former up by means of Thistle pincers as fast as they appear, and to stub up the Nettles by means of a mattock or drag hoe, removing all the creeping stems, and when sufficiently dry burning them. If you cannot do this, cut them off with a scythe as frequently as possible during summer, in no case allowing to get beyond the showing for flower stage. The frequent and continued cutting off weakens the stolones and the growth of the grass may be encouraged by liberal dressings of nitrate of soda and sulphate of ammonia in equal parts, mixed, applying 2½ cwt per acre.

**REMOVING THE BERRIES FROM ASPARAGUS PLANTS** (G. F. O. B.).—It is a good practice to strip off all the berries, as the production of seed weakens the plants more than anything, appropriating the matter that would otherwise go to the formation of good crowns and bold buds, upon which depends the production of early and fine heads in the following spring and early summer. We have found it necessary to strip off the berries every year as soon as formed, and thus give the plants the whole benefit of their resources in order to yield the finest heads. These pay best in our experience, and amply compensate for any outlay in removing the berries betimes.

**NAME OF CATERPILLAR** (K. A.).—The specimen sent is a caterpillar of the puss moth, about two-thirds grown. It feeds in July and August upon Poplar, Willow, or Alder, occasionally upon Apple. It is one of our most singular caterpillars, and has been fancied to have some resemblance to a cat; the moth also when looked at from below, as when seen through a pane of glass, has a furry aspect which is suggestive of a white cat. The head of the caterpillar is retractile, and while resting it draws this back into the thickened neck, and lifts the harder segments of the body. At the anal extremity are two curious horns, containing inner horns or "tentacula," which the creature flourishes if annoyed, but they are quite harmless. Under the chin, however, is a red slit, from which it can discharge an acid fluid as a defence. When adult it constructs a cocoon of gummy silk, into which fragments of wood are inserted, and which becomes very hard. The moth emerges during the early summer.

**MELONS TURNING YELLOW AND DECAYING AT BOTTOM AND TOP** (Raspail).—The most common cause of the fruit swelling up to netting size and then turning yellow and rotten at the stalk and eye is an excessive supply of water at the roots and too close and cold condition of the atmosphere, moisture resting on those parts, and attack by a fungus is thus greatly facilitated. Some varieties, however, are more subject to the disease than others, the very hard rinded and close netted sorts being most liable to attack. The only preventive is to maintain somewhat drier and warmer conditions of the atmosphere after the fruit has become full sized, and supply water at the roots only to keep the foliage from flagging. As the plants have different constitutions, some have the fruits in the state you name, and others are quite exempt. If moisture were kept from the fruit they would not probably be infested by the fungus, a species of *Gleosporium*, closely allied to *G. fructigenum*, and producing a bitter rot.

**PROPAGATING STEPHANOTIS** (Raspail).—This beautiful and very popular stove plant is increased by cuttings of the previous year's growth, inserted singly in pots, in spring, and placed in a close frame with a temperature of not less than 60deg. When rooted and growing freely they should be potted on, and when becoming large or well established do best planted out in a bed of prepared soil, it succeeding best in turfy loam. A bed about 3ft square will suffice for a large plant, the growth being trained to a trellis beneath the roof. The Elvaston variety is a very proliferous form. The best way to pack the trusses of bloom is in shallow wooden trays just sufficiently deep to hold them erectly and packed closely together, a little washed moss being placed on the bottom, then cover with tissue paper, and on that a layer of wadding, so that all may be kept secure. The trays are then fitted into a box two or three deep and securely fastened and labelled. It is not advisable to do more than place the truss ends in water, so as to have the blooms quite fresh when packed, but these dry on the surface. In this way we have despatched large quantities; but there may be other modes of packing which some correspondent may oblige with particulars of.

**VARIETIES OF PEACHES (X. Y. Z.).**—Royal George, Crimson Galande, Diamond, Bellegarde, and Sea Eagle are all good sorts, and should suit your purpose.

**BOOK ON GENERAL FARMING AND AGRICULTURE (J. D. B.).**—Dr. Frean's "Elements of Agriculture" (John Murray, London. 3s. 6d. net.) is the best, and may suit you.

**ADDRESS OF SCOTTISH HORTICULTURAL ASSOCIATION (Wm. Dalrymple).**—The secretary's name is Mr. Peter Loney, and his address 6, Carlton Street, Edinburgh, to whom you should write. The association's meeting rooms are at 5, St. Andrew Square, Edinburgh.

**GRAPES SPOTTED (J. T.).**—You are quite correct in assuming that the syringing with "hard" water after the fruits were colouring has been the cause of the blemishes. Of course, the berries are good, only their appearance is much spoilt through having the bloom mostly washed off. Did you read "H. D.'s" notes on syringing Grapes, on page 24, July 10?

**SUB-TROPICAL GARDENING (A. Edwards).**—Most garden manuals deal with the subject. Mr. Robinson's "English Flower Garden" supplies the information you want; price 15s. "London Parks and Gardens," from this office, though out of date may give you some guidance. Watch the gardening journals for reports of the bedding in London parks.

**COTTONY SUBSTANCE TAKEN FROM OFF ROSE TREE (C. C. E.).**—The brown bodies enveloped in cottony matter are very hard, and evidently the seeds of some member of the natural order Salicaceæ, either a species of Populus or Salix, we think the latter. Its presence on the Rose tree may be due to the agency of wind, or, as sometimes occurs, that of insects, such as the Rosechafer (*Cetonia aurata*) and Bracken Clock (*Phyllopertha horticola*). The holes in the leaflets are due to the punctures of some insect, possibly those of some beetle, but there is no presence of the malignant body.

**PARASITIC GROWTH ON RASPAIL PELARGONIUMS (Raspail).**—According to your description we think the plants were last year infested with one of the Didders, Cuscutæ, which, as you say, produces thread-like filaments with little blooms here and there, the growths attaching themselves to the stalks or leaves, drawing all the life out of the plants. The cause is because the seeds of the parasite were present in the soil, and these germinated, and the growths attached themselves to the Pelargoniums and abstracted nourishment from them by means of its absorbing roots pushed into the stems. The only way to get rid of the pest is to remove every particle of growth before it comes into flower, not leaving any on the plant, otherwise seeds would be formed, and going over with the soil again spring up the following season. Perhaps it was originally introduced in the soil used for potting, being the Lesser Dodder, *Cuscuta Epithymum*, sometimes common on leguminous plants, and the seeds taken along with turf used as compost for potting plants. If you use soil from a similar source, we should advise it to be baked before use, otherwise keep a sharp look out for the parasite and remove it promptly.

**MEASUREMENT OF HAY-STACK (A. L.).**—(1) The hay-stack, 13yds long, 6yds wide, and 5yds deep, will contain 390 cubic yards, and the weight may be 1 cwt. or two truss per cubic yard, hence 19 ton the weight of the stack. Both, however, are very vague, therefore to measure a hay-stack having a rectangular base, and when the stack is straight from the bottom to the eaves, and from the eaves to the top, proceed as follows: (1) Multiply the mean length of the bottom by the mean breadth, and the product will be the area of the bottom. Find the area of a section of the eaves in the same manner. Multiply half the sum of the length of the bottom and eaves by half the sum of the breadths, and the product will be the area of a section equally-distant from the bottom and eaves. To the area of the bottom add the area of the section at the eaves, and four times the area of the middle section, multiply this sum by the perpendicular height from the bottom to the eaves, and 1-6th of the product will be the solidity of the lower part. (2) Multiply the breadth at the eaves by the perpendicular height from the eaves to the top, and half the product will be the area of the end, which being multiplied by the mean length will give the solidity of the upper part. (3) Add these two solidities together, and the sum will be the contents of the whole stack. To get at the actual weight: Cut out a portion extending to the centre of stack, from top to bottom, and weigh it, and also measure the vacuity from which it is taken; then say, as the content of this part is to its weight, so is the content of the whole stack to its weight. The portion to be weighed should not be cut off the end, but taken out about half-way between the end and the middle, where it may be supposed the hay is of medium density.

**MOWING MACHINE (Idem).**—Both the mowing machines you name are excellent, and you would not do wrong in selecting either that of Shanks', which has cog movement, or that of Green's, with chain working. We have used both and found them first rate.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. R. E.).—1, *Deutzia crenata*, fl.-pl.; 2, *Rhus Cotinus*, the Smoke Sumach; 3, *Spiraea discolor*. (H. W. Kent).—1, *Oenothera Youngii*; 2, *Funkia Sieboldiana*; 3, *Spiraea Anthony Waterer*; 4, *Spiraea Douglasii*; 5, *Lythrum Salicaria*; 6, *Centaurea macrocephala*; 7, *Alstroemeria aurantiaca*; (no number) *Chrysanthemum lacustre*. (E. P. Windermere).—1, *Deutzia crenata*, fl.-pl.; 2, a bright green form of the Portugal Laurel (*Laurus lusitanicus*); 3, *Begonia Daviesii*. Other correspondents next week.

**EDITORIAL NOTICE.**—Our readers can greatly assist in adding interest to the pages of "The Journal" by their kindly contribution of timely notes and notices, and at the present period of the year there may be photographic examples of well-grown fruit, &c., growing or otherwise, that would be worthy of reproduction. The Editor would be pleased to have such subjects for consideration and probable use. He does not guarantee to pay for prints unless by special agreement.

## The First and the Last.

1839—Oxford.

Carlisle—1902.

We are sorry to have to write it—the last itinerant show of the Royal Agricultural Association Society of England is over. For good or ill, the show for the future is to be a fixture. We are not going to discuss the wisdom of such a move on the part of the directors, they are wiser men than we, but we do regret that financial losses are causing this change.

When the idea of an exhibition of agricultural stock was first propounded in 1838, it was thought that agriculturists would benefit more and become more widely interested in the work of the society if the meetings were held alternately at some large town, the centre of an agricultural district. The show was to be brought to the people, not the people to the show. From our own experience, we admit that there have been in our lives no pleasanter outings than those we have taken in connection with our visits to the Royal Agricultural Show. Farmers have always had the credit of being very conservative in their ways and methods, but surely nothing will so much tend to open the eyes of their understanding as ocular demonstration as to how work was done in counties other than their own.

As judges, or as ordinary visitors, one comes in touch with the farmers of the district. Often most handsomely entertained by fellow craftsmen, then we, in our turn, were, on a suitable opportunity, only too glad to return the hospitality we had enjoyed. Such meetings surely do much to strengthen the bonds of fellowship and good feeling.

But let us go back to Oxford in 1839. Can we picture an England without railways and without penny postage or telegrams? What a funny show ground it would be, and how primitive the arrangements? The first president was Lord Spencer. The show was to last, as far as we can make out, three days. The ground covered by exhibits was seven acres, and the attendance was stupendous! Yes, when we consider that the stock had either all to travel by road or canal boat, or, indeed, have the terrors of a sea passage, and that coaches, gigs, and saddle horses brought the spectators, it was a tremendous affair, so much so that folk of that day prophesied that never again would England see the like. The show proper seems to have been rather a secondary consideration. It was a special feature in the annual meeting where agriculturists from all parts gathered to read and discuss papers, and to have a good jollification generally.

One feature of the old system we should not care to see revived. The judges arrived at their decisions in private. Now the judging is one of the best parts of the entertainment, and the company round the big rings are always more than ready to let the judges know at once what they think of their awards. Mind, we do not think the public have any business so to express themselves, but they will do it whether or no. There were twelve classes, and they were thus divided:—I., Shorthorns; II., Herefords; III., Devons; IV., Cattle of any other breed; V., Dairy cattle; VI., Oxen; VII., Horses; VIII., Leicester sheep; IX., Southdown or other short-woolled sheep; X., Long woolled; XI., Pigs; XII., Extra stock, implements, roots, and seeds.

Perhaps in this list the two things that strike us most is the class for oxen, and the fact that horses are all put under one heading in Class VII., just two varieties, cart stallion, cart mare and foal, and stallion for breeding hunters, carriage horses, and roadsters. The cart stallion produced ten entries; mare and foal, six entries; and of the rest eight comprised the lot, and so without value that no prize was awarded! Can this be possible!

Among the instruments was from Jersey a small one-horse plough for setting Potatoes. This must be a misnomer, for we have not yet got a plough to do this work. The great Ipswich firm was well represented. A scorcher machine was exhibited, and we will own at once we thought it was some sort of horse singer; but we were quite out of it, as, on reference to the account of the show, it was a machine to burn up weeds as they grew.

At this exhibition we find Thomas Bates was present, and he brought with him, partly by sea, partly by canal, the great fore-runners of his wondrous Shorthorns, such cattle as had never

been seen before. We almost fancy no "Booth" blood was invented then, and the Collings Brothers had both joined the majority. There is in the "Royal Agricultural Society's Journal" for June, 1894, an amusing print of the Oxford Show ground, with gentlemen in white trousers and tail coats. The attendance on the first day was 20,000. The prize sheet amounted to £890. At the Oxford meeting it was decided that the next show should be held at Cambridge in 1840, and we see the resolution was most cordially received by Mr. Jonas Webb. This was in 1839, and we believe another Jonas Webb was on the Committee of Management at the Carlisle Show of this year.

Now let us turn to Carlisle. The president this time is of higher rank than a belted earl—the King's brother-in-law, Prince Christian. Instead of a ground of 7 acres, we fancy 50 is more like the size now, and instead of an attendance of 20,000 the committee are hardly satisfied with an aggregate of 93,600, and many of these enter at 5s. apiece. In 1839 the whole number of classes was only 12; in 1902 the horses alone are divided into 15 classes, and number 521. The cattle, which are grouped under 19 heads, add up to 667. Sheep, which were but of three varieties, have now swelled to seventeen, and number 546. Pigs, poultry, and produce are respectively 178, 653, and 461. Then there is the working dairy with practical demonstration, the competition of shoeing smiths, the bee driving, and the butter making competition. We have also the enormous army of implement makers, all the seedsmen, Royal and otherwise, all the patent cattle medicines, all the cake and feeding manufacturers, all the dairy and bee appliance, and poultry requisite caterers; in fact, we hardly dare venture to hint at what is *not* there. Sheep dipping and clipping, home and foreign. You can insure yourself, your workmen, and your stock on the grounds, and those who own a motor car can include it if they like. There is every sort of cheese and every variety of butter, with good wholesome cider and perry.

To get some idea of what there is to see on a Royal show ground, a glance through the thick catalogue will be a revelation. Perhaps the greatest attraction is the butter working tent, or rather, the competitive dairymaids. It takes a good deal of nerve to go quietly on with the work before the curious gaze of the assembled multitude—almost as nasty a job as facing the enemies' guns in South Africa.

Just think of the number of visitors, that is a sight in itself; prince and peasant, town worker and plough-boy, duchess and dairymaid (we were going to say all interested in agricultural work, but we hold our pen, that would be a too sweeping assertion). That it is a grand holiday outing for the adjacent country side none will deny, and, unlike many outings, it combines "instruction and amusement hand in hand." We wish good luck to the new venture; but we part most reluctantly with the old order of things that made the Royal Show a movable feast.

## Work on the Home Farm.

Though there have been showers and rumours of showers in parishes not far distant, and the papers have been reporting the abandonment of cricket matches, we have had a fine week, and have much good solid work to show for it. The hay is all well saved, and the condition is most excellent. Except in a few early cases, hay has been well got all round Doncaster way.

Good progress has been made amongst the Turnips, but much remains to do. Common Turnips are nearly all struck out, and then we can turn attention to Swede cleaning, which is badly in want of it. The young plants and weeds left in the rows grew so rapidly during the wet of a fortnight ago that the horse hoes could not properly contend with them. The Swedes have since then made great headway, and will soon cover in, so the last weeding is most urgently required.

Mangolds are looking grand, but here again there are a few ugly weeds showing, and they will need another looking over.

As the ears increase in weight the Corn crops show signs of going down without any provocation from showers or storms. A number of fields about here will not need a drop of rain before harvest; nay! they will be better without it. Barley is particularly heavy and thick, and it is certainly the crop of the year.

The interval between the hay and Corn harvests gives us a chance to rest some of the horses. The mares (with foals) which have been doing light work may now be turned right away to richer grass in the carse, also the two and three-year-olds which need rest more than the mares do.

Farmers are in some cases selling their wool. A neighbour has just let his two years clip go for 16s. 6d. per tod for hogg wool, and 10s. per tod for ewe. What a wretched figure! How many shillings per quarter increase on Wheat would be required to make up the wool deficiency? Surely the British public buys its raw woollen material so cheaply it must not grumble at another ½d. on the loaf. What are blankets worth now?

FOR THE COMING SEASON.

# CLIBRANS CHOICE BULBS.

OUR BULB DEPARTMENT has been an important feature of our business for many years. It has been our constant endeavour to supply only the very highest class of both home-grown and imported bulbs.

We specially invite attention to the following:—

**Choice Roman Hyacinths**  
 „ **Named Hyacinths**  
 „ **Single & Double Tulips**  
 „ **and Select Narcissus**  
 „ **Liliums**  
 „ **Retarded Lily of the Valley.**

CATALOGUE READY SHORTLY,  
Gratis and Post Free.

**MANCHESTER & ALTRINCHAM**

## OWN-ROOT ROSES FOR SUMMER PLANTING.

A magnificent stock of several thousands of the above, established in 5 inch pots for present planting, of leading H.P., Tea, Hybrid Tea, China, and other classes, 10'6 to 18/- per dozen, £4 to £6 per 100.

**Roses Now Finely in Bloom,**  
12 miles from London, close to Waltham Cross and Theobald's Grove Stations; frequent trains from Liverpool Street Station.

**WM. PAUL & SON,**  
WALTHAM CROSS, HERTS.

## RIVERS' FRUIT TREES, Roses, Vines, FIGS, ORANGES, AND Orchard-House Trees.

▲ LARGE AND SELECT STOCK  
ALWAYS ON VIEW.

ILLUSTRATED AND DESCRIPTIVE CATALOGUE,  
Post Free, 3d.

**THOMAS RIVERS & SON,**  
SAWBRIDGEWORTH, HERTS.  
BARLOW STATION, G.E.R.

No. 1154.—VOL. XLV., THIRD SERIES.

ESTABLISHED 1832.

No connection with any other firm of a similar name.

Successors to the late BARON VAN PALLANDT.

# ANT. ROOZEN & SON'S

CATALOGUE for 1902

THURSDAY, AUGUST 7, 1902.

### The Ivy.

IVY is a truly British plant, and seems interwoven with our history from its earliest periods. Less honoured than Oak, and less gloomy in its associations than the Yew, it is more immediately connected with our homes than either of these. Its adaptability to all situations and to the climate of all parts of the country is likewise a great recommendation to favour. In one place we see it covering the ground with a dense carpet, in another ascending the loftiest tree, and in both maintaining itself against all intruders. It frequently mantles our dwellings, and, by the natural armour which it affords, those no longer tenanted are to a great extent preserved from the attacks of time. To it the venerable appearance of many a ruin is as much due as to the masonry; to it many a rocky eminence owes much of its beauty; and an old tree acquires a new interest when its trunk and limbs become clothed in the evergreen drapery of the Ivy. I must now proceed to the details of its culture and uses, and endeavour to name a few of the many purposes for which it may be employed.

As regards culture, the Ivy is by no means particular, for it will live, nay, thrive, in situations unfavourable to most plants, and differing widely from each other; but in general it succeeds best in a dry soil containing plenty of stones. I may here observe, by way of parenthesis, that the utility of stones in land is not sufficiently recognised. Ivy thrives amongst such materials, but it is often enough found growing freely on clayey soils; and, in fact, it is common to plant it in any situation where it is wanted without any preparation whatever. Shade, however, seems to encourage its growth, and it will

**READERS** are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

usually do better against the north than the south side of a house. Moist shady woods also not unfrequently abound in Ivy. I believe that it is likewise plentiful in soils containing a good proportion of calcareous matter. It will, however, do well in some soils of an opposite nature; and, indeed, it is so obedient to the requirements of the cultivator that it may be made to succeed almost anywhere, and that with a very small space for its roots to run in. It will, in fact, struggle for a living in ground closely matted with the roots of plants.

The propagation of the Ivy is exceedingly easy and rapid. Seed is abundantly produced, and it germinates freely enough—too much so in some cases. Plants may also be raised in abundance from cuttings, or rather slips, put into the ground almost at any time, but certainly the autumn is the best period for doing so; while if valuable kinds be trained over the ground and pegged down, roots will be emitted at each joint. In this case, if the shoots be cut through some time before the plants are removed, the latter will be much improved in strength. These modes will generally be sufficient to increase this plant to any reasonable extent. Autumn I believe to be the best time to plant Ivy, but I have met with good success by planting in May, while March is perhaps the worst period; but plants in pots may be turned out at any time, and where only a few are to be planted it is best to obtain such, as they become more speedily established, and commence growing sooner.

With regard to trimming the Ivy, I by no means agree with some instructions as to the proper time for doing so in the south and more favoured parts of England, though the case may be different in the north, where the plant is less robust. The plan we adopt here is to cut in closely the Ivy covering dwelling-houses in the beginning of August, very often scarcely leaving a leaf, and yet the whole plant is again densely covered with foliage five or six weeks afterwards; and the season being then too far gone, the growth is confined to leaves, which, with us, become firm and established before winter, so as to sustain no injury from frosts. Thus the Ivy looks trim and neat up to the following June, when the summer shoots begin to elongate. It will be seen that there is with this plan a period of fully eight or nine months in which the plant looks as trim and uniform as the wall against which it clings, while the remainder of the time may be divided about equally between the period of the shoots growing in early summer and that of the formation of foliage in the latter part of the season. Now, let us see what are the effects of cutting Ivy in March. The formation of fresh foliage or shoots will then take about the same time as in the former case, while the period during which the Ivy forms a close carpet is very short indeed. Shoots of some length are formed, and these, remaining unshortened until the following March, are often in the way when a trim and symmetrical appearance ought to prevail.

As to the propriety of covering a dwelling-house with Ivy, there are various opinions, many contending that appearance is the only recommendation it has; but to trees it is very injurious, many an Oak has been strangled in its embraces, and Pinuses suffer still more. Within a very few yards of where I write, a Spruce Fir upwards of 70ft high has been for some years struggling for an existence, which is gradually drawing to a close. A few small patches of green on the tips of some of its branches are all the signs of life which it exhibits. The tree may survive one more year, while the mantle of Ivy triumphantly takes possession of the whole of the trunk; the Ivy branches, dense as Box, protrude in all directions, forming an elongated cone of greater symmetry than ever the Spruce did in its best days. The Ivy has not taken possession of any of the dead branches, although many of them are from 4in to 6in in diameter at their base; but the creeper apparently disdains to trust them as supports, and confines itself to the trunk. This support, however, will also have an end, for we have lost several trees, which had become quite denuded of branches, and only presented a beautifully tapering Ivy-covered spire. The trunk of the tree, when deprived of its vitality, can no longer resist decay, and when it becomes too weak to withstand a high wind, its load brings the whole down. Even Spruce and Larch trees containing from fifty to a hundred or more cubic feet of timber, are not proof against the elements.—J. R.

## Winter and Spring Stocks.

During the summer months Stocks of Ten-week and Intermediate strains stand in the front rank among annuals for the garden and lawn beds and borders. Though so much thought is given them for summer use, there does not seem the same attention paid them generally as a greenhouse subject, a purpose for which they are so well fitted. Not only do they afford decorative material for the greenhouse, conservatory, or dwelling-room in pots, but for vases and florists' work they are equally adapted and much valued. There are now fortunately a good range of suitable selections for pot work varying in style or colour. Some are tall and branching, like Princess Alice, for instance, while others are dwarf and bushy.

Cannell's Forcing, Sutton's Winter White, and All the Year Round represent a section remarkable for the size of the individual flower pip and pure colours, and while some are plain leaved, others have the deep green Wallflower-like foliage. For cutting, the branching Stocks have a marked value, and the sweetness of such flowers cannot fail to enlist the sympathies of the least observant of flower lovers. Much the finest Stocks I have grown for winter cutting is Sutton's Perfection, both white and crimson. Weekly cuttings set up a lateral growth which, with a good batch to draw upon, provide light sprays for weeks in succession, and these same plants, when they have done duty in pots, may, with a little preparatory hardening, be planted in the garden borders, where, with renewed root action, they soon furnish additional flower, and this, too, before the spring-sown Stock is ready.

From June to August afford a suitable period for seed sowing, the number and extent of sowings being guided by the ultimate use and demand. It must be reasonably conceded that for an early winter display a correspondingly early start must be made. Cool frame and outdoor stations should be assigned them in order that their growth may be sturdy and progressive. At this late period it would be advantageous to sow the seeds in small pots, so that their transfer shall not hinder their necessary advance. They quickly suffer from severe root disturbance at any time. While occupying cool frames it is necessary to give close attention to ventilation, otherwise mildew quickly takes possession of them, much to their disadvantage. Their removal to an airy greenhouse is advised before cold, damp weather sets in, as a preventive of mildew troubles.

They do well in pots ranging from 3in to 7in in diameter, and in small pots the dwarf section are highly decorative in the conservatory or greenhouse whilst in flower. As winter advances there may be found a necessity for a little more warmth than an ordinary greenhouse affords; at any rate, when they are required in early bloom. When advancing into flower, and the pots filled with hungry roots, a liberal fare is called for to sustain a requisite vigour. If starved, the bottom leaves die prematurely.—W. S., Wilts.

## The Sparrow.

At no time of the year are the mischievous habits of sparrows more strikingly illustrated than at the present, when the grain crops are approaching maturity. Later on, when ripe corn is more general and plentiful, the damage is not so conspicuous, but at this stage the depredations are easily seen, because of the concentration of the winged forces on the earliest patches of corn. It will be noticed that large portions of the crops are practically threshed as a result of the attentions of the hedge sparrows, and yet these restricted areas merely furnish examples, and do not constitute the whole of the damage for which these birds are responsible. The sparrow is not without its champions, but they are not to be found among those whose crops it largely lives on and who are in a proper position to judge of the habits of the bird. Let anyone who is still in doubt as to the attitude which the farmer should adopt towards the sparrow take a walk through the cornfields as the crops are assuming the harvest colour, and they will promptly have their mind made clear on the point. The sparrow may have possibly its uses, even from the farmer's point of view; but there must be few observant agriculturists who would not endorse the opinion that its possible good qualities are far outweighed by the mischief it is responsible for.

**Lælio-Cattleya Broomfieldense.**

This bigeneric hybrid was certificated in 1894, and comes as a cross from *Cattleya aurea chrysotexa* and *Lælia pumila* Dayana. In habit it is intermediate. The sepals and petals are rose-purple, and a lip that is even brighter than they, being also frilled and wavy. The forefront part is deep crimson-purple, the throat being marked with gold and crimson. It is not at all common.

**The Week's Cultural Notes.**

The present is not a particularly busy season for the Orchid grower, as the work is largely of a routine character. Some growers apparently find it monotonous to go on day after day, watering, shading, damping and cleaning, and in proof of the old saying about idle hands, begin to pull about plants at the root that are far better left alone. But there is no need to be idle. Orchids have the peculiarity of being almost, if not quite, as interesting when in growth as when in flower, and the daily round may be made profitable by examining the progress made by the specimens, and checking anything that may be going wrong.

The *Cattleya* house will be especially interesting now in the matter of growths, and a little rearrangement will probably seem necessary to the careful grower. Plants, for instance, of *Cattleya Mossiæ*, that have been placed in the coolest and shadiest part of the house for flowering, will now be moved to a better position, for this popular species has its season's growth still to make; not like *C. Gaskelliana* and others, that flower upon the current year's pseudo-bulb. This is only one instance out of many that will come under the eye of an interested grower.

Among the *Dendrobiums* some plants will in all probability be growing in a manner not acceptable. Before, or as soon as, the growths are completed, a new one will start from the base of the one just maturing, and obviously it will be quite impossible to finish it this season. What is to be done with it? The best thing to do is to allow the primary growth time to finish properly and treat the precocious youngster as if it had no existence, placing the plants in a cool light house at once when this occurs. Probably this will have the effect of checking its growing propensities until spring and more suitable conditions arrive. In the case of *D. Wardianum*, which is one of the principal offenders in this way, the growths come away again all right, though I have no doubt that if it could be kept to more normal seasons it would be a longer lived species under cultivation.

Those singular Orchids, *Catasetums* and *Mormodes*, will also

be finishing up now, and nothing short of a thorough roasting in the sun seems to satisfy these truly deciduous species. As soon as the foliage is ripe there can be no harm in placing them in the full sun and exposing them to plenty of air. Plants that are not thoroughly ripened by some such means will never flower satisfactorily.—H. R. R.

**Freessias for the Winter.**

None of the many bulbous flowers now grown for winter and spring use are more appreciated than *Freessias*. They are so easily adapted to the requirements of greenhouse treatment, that quite a prolonged season may be had of decorative plants or vase flowers in a cut state. By adopting a successive practice in potting, there is no difficulty in having flowers for about four months without much cost in firing or the purchasing of stock. Non-success in dealing with imported bulbs a few years since, raised an impression that they were unremunerative and not

easy to manage. Later experience dispels these thoughts, for last winter in particular, the imported bulbs gave much the stronger plants and the finest racemes grown under exactly the same conditions as the home-saved stock.

To obtain flowers at Christmas, the potting of selected bulbs need be carried out in July, so that time is allowed for steady advancement, and the necessity of hard forcing averted. In potting, some take no care to select the bulbs by sifting the larger from the smaller, while others make this a rigid practice. Last year we saw a large batch of *Freessias*, which, in their potting, had been simply sown in their flowering size on the surface of the prepared soil, which three-parts filled the pots. They came up as a consequence as thick almost as Mustard and Cress, and what was not a little surprising, they flowered wonderfully well.

Now, while some would at once condemn this apparently "slack style" of potting, there was not an atom of doubt in their ultimate use that they were far better fitted, because more decorative, than those having the rule of thumb number of eight or twelve, according to the size of pot employed. It must be remembered, however, that there were a good proportion of large, saved, flowering bulbs, or this success would not have been allowed.

*Freessias*, though intensely appreciated by my employers in a cut state, are set a lower value on when grown a few bulbs in a pot (as a vase plant), and since the success of those just referred to are remembered, there is a feeling set up that a little more freedom of small roots will advance their utility as pot-grown plants. For cutting purposes particularly, later batches can be grown more freely and with less effort in shallow boxes. These afford, too, a means of raising a stock of flowering bulbs from the very small offsets which cluster so thickly round the old roots.

**Lælio-Cattleya Broomfieldense.**

Another point in their culture on which growers differ, is the covering up of the pots in cocoa-nut fibre or ashes, leaves, and such like, when potted. While success attend both practices, it cannot be denied that they do as well, if not infinitely better, without being so protected. I have seen them growing as well as they can possibly be expected to grow, simply placed on a cinder bed on a garden plot, where adjacent trees provided a little sun-and-wind-break. These were wonderfully sturdy, the growth being well maintained by this open-air treatment, so long as it was deemed safe to trust them out of doors. Transferred to warm greenhouses, there would be a more ready response and marked gain over plants somewhat drawn first by a covering of the pots, and the afterward sheltering influence of glass lights. To some extent, too, there would be less necessity of strict rule in potting successfully for bringing on the varied batches, one after another, by adopting this sanatorium principle. Uniformity of moisture would be the better maintained by the use of an ordinary frame, without lights, or the fixing of some boards in a suitable square, this protecting the outside pots from sun and drying winds.—W. S.

## Old-time Gardening.

(Continued from p. 14.)

The latest instalment in this series of articles on the history of British gardening, dealt at some length with Tusser's book named "Five Hundred Points of Husbandry," and I quoted lists of the names of flowers and vegetables grown in his time, and mentioned by him. In this book of his, he provides, moreover, an epitome of gardening in rhymes and measure as quaintly unique as the matter they serve to convey is sound. It is very remarkable, this book affording abundant proof that in many respects the mid-sixteenth century horticulturist had not much to learn in practical gardening. Ground was to be trenched in November, and in January Tusser exclaims:—

Thy garden plot lately, wel trenched and muckt,  
Would now be twifallowed, the mallows outpluckt.

I wonder how many go to the trouble of digging or "twifallowing" trenched grounds nowadays, yet it is an invaluable aid to gardening. Then, as a fruit grower, how safe is his advice! Concerning grafting, he tells us in the March Abstract:—

Who grafting loves, now grafting proves,  
Of every suit, graffe daintee fruit.  
Graffe good fruit all, or graffe not at all.

Among pithy remarks on fruit gathering these may be accepted as a sample:—

Out, fruit go and gather, but not in the deaw,  
With Crab and the Walnut, for fear of a shrew.

But lest there should be over-haste, he gives this warning note:—

Fruit gathered too timelie, will taste of the wood,  
Will shrink and be bitter, and sildome prove good.

therefore,

|   |                        |
|---|------------------------|
| Pluck fruit to last                               | Forget it not,         |
| When Michell is past.                             | Fruit brused will not. |
| Good fruit and good plentie doth wel in the loft. |                        |
| Then make thee an orchard, and cherish it oft.    |                        |

Vines were a fruit commonly cultivated, and these he advises to be planted in February. What is said of Strawberries emphasises the inconceivable advance made since then, when wild Strawberries alone were cultivated:—

Wife, into the garden, and set me a plot  
With Strawberry roots of the best to be got.  
Such growing abroad, among thornes in the wood,  
Well chosen and pricked, prove excellent good.  
The Barbery, Respis, and Goosebery, too,  
Looke now to be planted as other things do.  
The Goosebery, Respis, Roses, al three,  
With Strawberies vnder them, trimly agree.

Exactly the same methods of treating Strawberries are noted by later writers, and actually they were sometimes set under the shade of orchard trees. Moreover, the Strawberry was thought not to be hardy:—

If frost do continue, take this for a law,  
The Strawberies look to be covered with straw.

And not only this hardy fruit, but:—

The Gilleflower also, the skilful do know,  
Doth look to be covered in frost and in snow.  
The knot and the border, and Rosemary gay,  
Do crave the like succour for dying away.

Of pot plants the farmer cultivated at least two!

Fine Basil desireth it may be her lot  
To grow as a Gilleflower, triu in a pot.

Peas formed the most important crop of the kitchen garden, and directions occur from time to time as to what required doing.

Greene peason or hastings at Hallowtide sow,  
In harty good soile he requireth to grow.  
Gray peason or runcivals cheerey to stand,  
At Candlemas sow with a plentiful hand.

"Runcivals" were to be sticked in February and late Peas to be sown in May, while

White peason, both good for the pot and the purse,  
By sowing too timely prove often the worse.

There are many other wise sayings as to sowing, planting, weeding, &c., and, strange as it may appear to us now, the chief care of the garden devolved on the mistress of the establishment.

In March and in April, from morning till night,  
In sowing and setting good huswives delight.  
To have in a garden or other like plot,  
To trim vp their house and to furnish their pot.

"Good huswives in summer wil save their own seed," "Maids Mustard seed gather, for being too ripe," are other quotations. They also managed the Flax and the Hemp crop, and Hemp, Tusser assures these lady gardeners, should always be planted among Nettles!

Saffron, too, indispensable in every household, was under their charge. It was to be transplanted in gardens once every three years, and in the field every fourth year. The bed was "pared," or the surface cleaned, between the two "S. Maries daies," and "fortie foot" furnished Saffron enough for a lord and a knight. During winter "linnen" was bleached, laid on the densely grown foliage. The secret of Saffron culture seems to be lost, as the plant is one of the most shy plants to bloom, missing year after year. In 1901 it flowered here in Haddingtonshire, but not till November. It is just possible, however, that the old Saffron Crocus has disappeared and less valuable seedlings have usurped its place. The "huswife" was also responsible for the healing of the sick, and had to cultivate physic before she could prescribe it to her patients.

In addition to details under "Good Huswiflie Physicke," here and there throughout the book remarks are to be found on the subject.

Get water of fumetorie, liver to cool,  
Conserves of Barberie, Quinces or such,  
White Endive and Suckorie, with Spinage enough;  
All such with good potherbs should follow the plough.  
Make physicke true, of Wormwood and Rue.  
What savor is better if physicke be true  
For places infested than Wormwood and Rue?" &c.

Sloes were preserved in bed-straw, or hung up attached to their branches, to be used in dysentery. The farmer, it would appear, did not sand his garden walks, but was content with commoner materials:—

Save sawdust and brickdust, and ashes so fine,  
For allie to walk in, with neighbor of thine.

And "haws" and "brembles" (wild Roses) were sown for hedging purposes. Very good advice is given how to proceed in the furnishing of an "arbor":—

To arbor begun and quicke setted about,  
No powling or wadling til set be for out.

That is, the poles and wattles (split willows not improbably) were not to be fixed till growth had advanced sufficiently to require support.

The first book devoted solely to the cultivation of fruit appeared in 1572. It is entitled "A Book of the Arte and Maner howe to Plant and Graff all sortes of Trees, &c.," by Leonard Mascall. This person was clerk of the kitchen to Archbishop Parker, and he varied his labours on gardening by invasions into the departments of farriery, stock-keeping, and kindred subjects, and, as a fact, the work above mentioned is merely a translation from the Dutch. It details with much fulness the raising of fruit trees from "pepins," grafting and its benefits. Later, bound up with "A Perfect Platforme of a Hoppe Garden" and "The Expert Gardener," it was published as "The Countreyman's Recreation." In 1578 another translation, which proved a very popular one, was produced. This was "Dedoens Nieuwe Herball or Historie of Planten, translated by Henry Lyte, Esquayer." It forms a good sized folio, with numerous faithfully executed line engravings of the plants described.

An octavo without the engraving followed in 1586. This work has already been valued, and as early as 1580 among things advised to be carried on a voyage of discovery in that year occurs "The New Herball." It is, however, of no great utility viewed from the purely horticultural vantage; but it is rich in old English plant names. Lyte himself appears not to have possessed a garden, at least he never ventures to say he himself cultivated plants, but only remarks a plant is to be found "in the gardens of certayne Herboristes," or as in the case of Ceratonia siliqua, "they be sometimes founde in the gardens of some diligent Herboristes; but they be so small shrubbes that

they can neither bring forth flowers nor fruit." He possessed and gave utterance to very strong opinions, as of Nerium Oleander, where he says:—"It hath scarce one good propertie. It may be compared to a Pharisee, who maketh a glorious and beautifull shewe, but inwardly is of a corrupt and poysoned nature. God graunt all true Christians and Christian Realmes whereas this tree or any branche thereof beginneth to spread and flourishe to put to their helping handes to destroy it and all the branches thereof: as dissimulation, Couvetousnesse, Briberie, Sir Symonie, and Maister Ursurie." A MS. note of about a contemporary date in my copy agrees with the author that "Oleander or Rose Baye is an Curssed herbe." There is, too, a curious reference to the Dutch Boers, who at this date appear to have been causing not a little trouble in Holland.

Langham's "Garden of Health," 1579, contains interesting notes on plants; and Bullein's, or Boleyn's, "Government of Health," 1588, is a very curious book, the author having been possessed of an exuberant humour, with a method of placing it before his readers of the happiest. From him we get a name of Hemp, "St. Audrey's Laces," the root of tawdry, a word circulating before this time as in "The Shepherd's Calendar":—"Girde in your waste for more finenesse with a tawdry lace"; and a tawdry lace, it will be remembered, was desired by Mopsa when the clever, if rascally, Autolycus was disposing of his wares. It does not follow that these were made of Hemp, and Drayton seems to give the correct way of making them in the "Polyolbion":—"With white pebbles make her tawdries for her neck." Bullein's "St. Audrey's Laces" was a necklace too, just as gallow grass and neckweed were other names he uses with a grim humour for Hemp.

In 1594 "The Jewell House of Arte and Nature," by Sir Hugh Platte, was published. It is divided into three parts, of which the second, treating of soils, is of most interest to the gardener. Occasionally this part is to be got bound up separate from the others; but the work as a whole is of little value. The author possessed two country houses and a town house at Lincoln's Inn. Gerard's "Herball," the greatest work of its kind of the period, falls next to be noted; but previous to doing so a short résumé of what was passing outside gardening will serve to elucidate and explain the work in question, which is the first to treat seriously of the advance section of that exotic vegetation which fills our gardens to-day.—B.

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### Some Hardy Plants at Kew.

Though rather of a weedy and straggling habit of growth the new *Campanula sulphurea* will be welcomed in places on account of its pale yellow flowers. We have now violet, purple, blue, white, pink, yellow, and perhaps other colours amongst *Campanulas*. The species is now in flower at Kew, and would appear to be an annual.

*Rodgersia pinnata* is a Chinese species in common with others of the genus, is perhaps little known, being one of three introduced to cultivation within the last few years. At Kew it is growing beside the little dripping stream in the centre of the rock-garden, and is now in flower. The tall thyrsoid inflorescence bears beautiful rose flowers rather densely packed, and the foliage is finer than *R. podophylla*. The six leaflets are arranged around a central axis at the end of the petiole. Mr. Elwes, to whom I pointed it out, was much delighted with it.

*Genista dalmatica* is a very dwarf and dense shrub, with pretty grey-green shoots exactly like the young growths of the common Gorse, and the terminal close-set racemes are deep, golden yellow. It can be used on rockeries to advantage, or in such places as those in which one usually finds the Spanish Brooms flourishing.

Covering a tiny spot on one of the rockery pockets we find *Sedum cæruleum*, a perfect little gem, with its blue-fringed flowers. The flowers at present hide the minute stems and leaves, and remind one of *Houstonia cærulea*. Contrary to the rule among *Sedums*, the flowers in this tiny stranger have ten segments.

Stepping from the rock garden to the herbaceous ground one cannot fail to notice the very handsome *Senecio macroglossus*, with spathulate foliage nearly 2ft long, bright glaucous in colour, and of the texture of a Cauliflower leaf. As a solitaire for placing by the edge of a still water pool it is one to be commended. The tall and deep yellow inflorescences are exceedingly effective.

One would like to individualise many another fine plant or plants which could be chosen from the collection of Delphiniums, the Poppies, *Campanulas*, *Galegas*, *Lathyrus*, *Polygonums*,

*Salvias*, *Lychnises*, and the Pink family is general, while they are still with us, but the chance may be taken to write of them in a following number.

### Floral Designs.

In my peregrinations about the shops recently I have noticed a basket of rectangular shape, poised on a pedestal, and filled with yellow *Coleus*, yellow *Codiaeums* (*Crotoms*), yellow *Privet*, and yellow Spanish *Iris*es. Broad yellow ribbons in loops and bows were fixed on a top-rail at the back, and the basket was bound round with the palest green ribbon and one bow tied at the left-hand front corner. Another basket of the same shape and size (18in by 12in) contained only the Zonal *Pelargonium King of Denmark*, the plants being robust and well-flowered. A bright cerise-salmon satin ribbon, 6in or 7in broad, was boldly looped right up amongst the flowers, and certainly improved the richness and splendour of the effort immensely. Another similar basket contained cut flowers of pink Sweet Peas at the left-hand front corner, pink Carnations at the right-hand corner, and the whole of the back filled with upright racemes of Lily of the Valley, the basket being bound round with the indispensable red ribbon.

Sweet Peas of the variety Lady Grisel Hamilton, erect in tubes with Rye and Briza, standing on a white cloth, were also delightfully pretty and simple. In the shops I see that the merits of the new *Kalanchoe flammea* with brilliant scarlet cymes is already recognised.

### Southend-on-Sea.

Though I have never found Essex at all beautiful, the county at the same time possesses features and centres of interest. Southend-on-Sea, at its south-eastern "neuck," as a Scotsman might say, is its most popular watering-place, for I believe Southend lays claim to that poetical appellation. From London one journeys by the Tilbury and Southend Railway—a good service—through some of the most squalid districts and densely populated boroughs of this great metropolis, through Stepney, and on first, to West Ham, then East Ham, either of which have a population almost equal to that of all South Africa, and so out to the opener country and the market gardens. The flatness of the region traversed is proverbial, and with the numerous smoke-belching chimneys which one discovers in all directions for a long way down, the scene throughout is not strictly inviting.

London has been twitted on the supposition that it possesses only one tree—the London Plane. This is not so. London has two trees. The second tree is the Black Poplar. Go by the "tube" to Shepherd's Bush and you will see long vistas lined with absolutely perfect Poplars and Planes placed alternately in rows on either side of the great thoroughfares. The Black Poplar is a splendid tree. It is used in North London, in South London, in West London, and I found it flourishing in the districts already named in East London.

But though the southern parts of Essex are not fruitful to all appearances, one forgets of that when nearing Southend, where the land gains in character, higher and broken ground arises, and one has a general sense that there is "something doing." The ozone wafts strongly, the huts of the cockle-gatherers line the beach, and soon the newer part of this now popular resort is opened before the visitor.

Southend has the longest pier in the world, with an electric tram running to the end of it; it has beautiful esplanades, and is now continually improving them; it has overhead electric trams, and beautiful parks, gardens, shrubberies, and rural walks or drives near by. The grounds named The Shrubby are clothed densely with Oak trees, among which, on the rather steeply sloping banks, are many shaded pathways, lined here and there with flower borders and overhung with beautiful Roses. So, too, the Marine Park and the Public Recreation Grounds (with a lake), both at the east end of the town, are handsome and most enjoyable for the inhabitants and the visitors. With a powerful and business-seeking Corporation, Southend seems unlikely to be wanting in the matter of further parks or gardens. These can be secured from the numerous estates surrounding the town, and it is imperative in the best interests of this seaside place, that as many features of interest as possible should be added.—WANDERING WILLIE.

### Sweet Lavender.

About the middle half of August the Lavender sheaves will be gathered in from the fields of Surrey, and from that other Lavender land which has been much developed of late years in the neighbourhood of Hitchin, Herts. Though so much at home amongst us, the real place of its origin is Southern Europe. The harvest of flowers—Roses, Violets, Jasmine—gives to the Valley of Var, in Southern France, great commercial importance; but England, however, is making a bid for some of this wealth. In her famous village industry at Wallington, Miss Sprules grows Provence Roses as well as Lavender.

### Roses at Presdales, Herts.

In answer to our request for information respecting the Rose garden and varieties at Presdales, near Ware, Mr. G. Fulford writes as follows:—"The beds had to be made here, as we have a very shallow soil, resting on a bed of gravel. The land suffers greatly in summer, even although we water a great deal. The Rose beds consist of our best loam which is light, but a mixture of clay and manure was added when planting. We have to manure heavily every year, and feed the Roses well with guano and liquid manure. The pergola (see illustration) is made of rough brick piers, covered with undressed Oak and Fir branches. Between the beds, and in the centre, poles are let into the ground, these being supported by iron stakes, and chains (to which the Roses are trained) are stretched from post to post. The majority are now covered, having only been planted five years. At the end of the Rose garden a hedge of Sweet Briars are growing on wires.

"The climbing Roses, which extend over the pergola, consist of the following 36 varieties: Leopoldine d'Orleans, Aglaia, Brightness of Cheshunt, Arvensis, Madame Plantier, Charles Lawson, W. A. Richardson, Ulrich Brunner, Alister Stella Gray, Paul's Single White, The Garland, Paul's Carmine Pillar, gracilis, Coupe d'Hébé, Princess Louise, Gloire de Dijon, Madame A. Carrière, Fortuniana, Bennett's Seedling, Madame Berard, Bouquet d'Or, Longworth Rambler, Turner's Crimson Rambler, Flora, Magna Charta, Morletta, Victor Verdier, Monsieur Desir, Reine Marie Henriette, Blairi No. 2, Kaiserin Friedrich, Yellow Banksian, Reine Olga de Wurtemberg, Dundee Rambler, Gaston Chandon, Thalia.

"In beds there are the following thirty-six varieties of dwarf Roses:—Marquise de Salisbury, Victor Hugo, Paul's Cheshunt Scarlet, Bacchus, Duke of Edinburgh, Général Jacqueminot, Captain Christy, Madame A. Chateney, Docteur Andry, Baroness Rothschild, Camoens, Paul's Early Blush, Viscountess Folkestone, La France, Clio, Augustine Guinnoiseau, Mrs. W. J. Grant, Ulrich Brunner, Lady Mary Fitzwilliam, Her Majesty, Hon. Edith Gifford, Madame Lambard, Sunset, Madame Falcot, Madame C. Guinnoiseau, Catherine Mermet, Marie Van Houtte, Captain Hayward, Paul Neyron, Clara Watson, Mrs. Paul, Madame Victor Verdier, Duke of Edinburgh, General Washington, Muriel Grahame, Lady Battersea. The two last-named varieties do not appear to be very strong growers, but may improve as they get established."

## Strawberries.

With a good stock of early and strongly rooted runners there should be but little difficulty in establishing a bed for the production of a profitable crop next season. In few cases will runners be sufficiently freely rooted if reliance is placed on those to be found in the soil between, or outside, the rows, even where they may have been specially encouraged to root well. Such plants will, however, come in well for late plantations. For immediate planting the best are those which have been assisted to root into pots or turves. The crowns are strong, the leaves healthy, and the root fibres numerous and ready to rapidly multiply.

### Propagation and Planting Early Runners.

The ground for this early planting may be a site not necessarily just recently prepared, but one that was liberally treated in spring in the matter of deep culture and free manuring. Since that time it may have produced a crop of early Potatoes, which have now been lifted. The preparation necessary on such ground mainly consists in cleaning and levelling the surface, it not being essential to loosen the soil deeply at this stage; Strawberries, as a rule, preferring the ground to be of a firm character, though of a good heart.

The plants should be well moistened several hours before planting, and, as a further means of ensuring them plenty of moisture to assist their becoming quickly established in their new quarters, plant in a fairly deep drill, or form a basin round each to hold water. August being a dry month, artificial waterings will be a great help during the hottest periods. The distance between the rows may be from 2ft to 30in, and 15in to 18in from plant to plant.

Royal Sovereign cannot be excelled. It is good, early, and prolific. Noble, President, Monarch, and Leader are also first

class varieties for main crops, with Latest of All and Waterloo for late supplies. The new Laxton's Fillbasket, and especially the variety named "The Laxton," are very meritorious, and we commend them. It is well to try new sorts occasionally.

Although runners left to themselves form roots and establish plenty of fibres in the soil, they cannot always do this, and a little attention is required in clearing away the obstructive growth of crowded runners and weeds. Fork up the soil about them, so that a loose and fertile medium is secured, into which the roots can readily push. Peg or otherwise fasten them in position at the most desirable spots, and cut off the runners extending beyond the plantlets. These will come in conveniently for the later plantations.—E. D. S.

## The Shrubbery in August.

A combination of trees and shrubs represents the majority of shrubberies. The trees afford the shelter and shade essential alike to urban, suburban, and rural dwellings, and beneath and in front of the trees, forming the undergrowth and fencing, are disposed a number of shrubs. After the spring and early summer this assemblage of trees and shrubs is more or less monotonous, varying, of course, with the variety of subjects. Coloured foliage plays an important part in the attractiveness or otherwise of the shrubbery after the heyday of flowering and perfume is over, being aided by the profusion of berries and fruits that in many cases are quite as beautiful as the flowers that precede them. Flowers, however, are not, or need not at this season be absent, and that they brighten or are themselves heightened in contrast by the prevailing green is matter of importance where herbaceous plants do not besprinkle, as they seldom do advantageously, the trees and shrubs.

But my object is not to review the many subjects that enter into the composition of shrubberies, rather to note a few that are not too often seen, and without which the shrubbery is certainly unattractive in August. I should like to mention that the very beautiful shrub, *Choisya ternata*, in examples 4ft to 6ft high and half as much again in diameter, produced its peduncles of white, sweet-scented flowers in great profusion at the end of June, and is one of those charming plants with bright green ternate leaves far too seldom seen. That as a prelude, with the reminder that it is only hardy in the southern and milder districts of England, for it is a native of Mexico.

*Olearia Haasti*, an evergreen with small leaves, white beneath and densely disposed, has been smothered with its numerous heads of white, sweetly scented flowers, in examples of scarcely a yard up to 6ft in height and as much through. There are some fine specimens in the burial ground attached to the Baptist Church, Dagnal Street, St. Albans, and smaller ones in the cemetery. It is a native of New Zealand.

Rush or Spanish Broom, *Spartium junceum*, has no equal for bright golden sheen, the flowers yellow, fragrant, and disposed in terminal racemes. It is very ornamental when in flower, and though becoming somewhat straggling with age, is well adapted for shrubberies. It may be kept quite low by cutting down and spurring the growths close in every spring, thus securing bushes of 3ft or 4ft height, with splendid growth and extra fine flowers. Left to itself it becomes somewhat bare at bottom and attains a height of 6ft to 10ft. It hails from the Mediterranean regions and Canary Isles.

*Kerria japonica* was bedecked with its bright orange yellow flowers, the single-flowered form being much the most elegant plant, having a graceful habit, and specimens may be had scarcely a yard high and as much or more through by cutting in close in spring. Indeed, it may be cut to any extent, and flowers all the better in consequence, being nearly always in flower.

The *Spiræas* or shrubby Meadowsweets were delightful. *S. bella*, with its terminal cymes of flowers of a beautiful red colour, lit up the greenery of adjacent evergreens in a telling manner. *S. Douglasi* charmed with its bright pink bloom borne in a dense terminal thyrsoid panicle 6in to 9in in length. Not least in attractiveness was the naturalised in Britain Willow-leaved *S. salicifolia*, with its rosy or pink blooms disposed in terminal, racemose, dense, sub-cylindric cymes. The Siberian or Sorbus-leaved, *S. sorbifolia*, gave its flowers in thyrs-like panicles, its white telling against dark green.

I pass now to the changeables. The finest examples I have yet seen in pots of *Hydrangea hortensis* are in the Stationmaster's garden in Ridgmount Road, opposite St. Albans Midland Railway Station. The plants are about a yard high and more through, and the heads of bloom are not only abundant, but remarkably large and fine; not stiff, formal things on the stake and tie system, but compact, natural trained specimens. I was also delighted to see *H. paniculata grandiflora* as standards, the stems about 3ft high, in a villa garden in Clarence Road, St. Albans, the white flowers disposed in a large, terminal, leafy panicle 9in to 12in long, consisting of openly arranged, small, star-shaped

blooms, intermixed throughout with sterile ones more than an inch across, having a fine effect. These are planted out, and stand the weather unharmed. The plants of *H. hortensis* require, of course, protection in winter, and why not give it in the case of planted-out specimens, so as to have some colour in the late summer months in the shrubbery?

The Smoke Plant or Burning Bush, *Rhus Cotinus*, is like a bush on fire by the bright colouring of the hairs produced by the lengthening of the pedicels after flowering. What makes the branches of this shrub die off suddenly without apparent reason? Fungus. What and when do the fruits appear? I confess to being unsuccessful in tracing cause.

Syrian Mallow, *Hibiscus syriacus*, or *Althæa frutex* vars., so seldom seen, though highly ornamental, have and still will charm alike by their varied colouration, large single or double flowers.

The Goat-scented St. John's Wort has bloomed profusely, its yellow flowers being very conspicuous. *H. Hypericum hircinum* does well in shade. Aaron's Beard or Rose of Sharon, *H. caly-*

white berries. It flowers much finer in the open than in shade, and the plants are all the better berried for that and a relatively dry gravelly soil.

*Magnolia grandiflora* is blooming grandly against walls, its white flowers contrasting finely with the noble evergreen foliage, and the air is laden with fragrance. Sweeter still is the essence diffused by the white Jasmine, and to heighten the whole is the glowing colour of *Eseallonia macrantha*, the shining deep green foliage being very beautiful, and setting off the racemes of crimson-red flowers to great advantage.

As something out of the common, I may mention a Spruce tree in nature surmounted by Traveller's Joy, *Clematis Vitalba*, the Spruce being over 45ft in height and the Clematis forming a pyramid of white blossom about 12yds in height. In a villa garden a similar thing occurs, but whether by accident or design I do not know. The Old Man's Beard has surmounted the Spruce, which is about 20ft in height, and in August was "a sight" of white bloom, which exhaled a sweet almond scent. In congruity

Rose Garden at Presdales. (See page 124.)

cinum, is still better in dry, shaded places, and it flowers splendidly, being nearly, if not quite, evergreen. In the open it flowers earlier than in shade, and the flowers are much larger. *H. elatum* has also been very fine.

*Leycesteria formosa* forms a moderately large spreading shrub in gravelly or well-drained soil, is very handsome, its white flowers tinged with purple being disposed in leafy drooping racemes, and deserves a much more extended cultivation than it now enjoys.

Still rarer are the Adam's Needle, Bear Grass, or Spanish Bayonet. What more beautiful than the Mound Lily, *Yucca gloriosa*? In July or August the splendid panicles of flowers tinged with red outside are charming, thrown up above the ample leaves to a height of 4ft to 6ft. The form known as *Y. recurva*, syn. *Y. gloriosa recurvifolia*, is a charming lawn plant, and is now throwing up its panicles for blooming, the plants having been transplanted in the spring.

The Snowberry is still blooming, though the white berries are as large as birds' eggs, the cluster-flowered *Symphoricarpus racemosus* being, perhaps, the best variety, and blooming from July to September along the same growth with the berries is very interesting, the rose-coloured flowers contrasting well with the

I have not come across many, if anything more pleasing to the eye and sense. On the other hand, both were offended by a Dundee Rambler Rose planted at the foot of a large Apple tree, and making an effort to reach daylight through the head, eanked and infested by American blight. Evidence was afforded of the Rose not being a parasite of support, as in the case of the White Vine on the evergreen, and it in consequence was a poor thing struggling against adverse circumstances for existence. Thus was deduced one more lesson from the contrast of fitness and unfitness of things.—A. G.

#### A Giant Tree.

In California a specimen of the *Sequoia Wellingtonia* has been discovered, far exceeding the largest yet known. Its breadth is 51ft and its circumference 154ft 8in, whereas those hitherto accounted the greatest measured from 80ft to 95ft in length and about 30ft in diameter. It is, fortunately, also, the property of the Government, and may therefore escape the millionaire trust.

### The Judas Tree.

I take in your excellent Journal, and my gardener, whom I give it to to bind up for reference, is anxious that in connection with the account of a few Judas Trees in England quoted, it should be named that in this garden (The Knoll) there is a good sized one, planted, I suppose, twelve years, which bears its pink blossoms pretty in spring, and also seed pods later. There is also still, I believe, a fine old Judas Tree in a garden at East Clevedon.—J. L. WOODWARD, Clevedon.

### Gardeners' Education.

The subject is so highly interesting that it is no surprise to me why a "champion of learning" has not yet arisen to refute the arguments put forth. The champions, like "Brer Rabbit," "lay low and say nuffin," knowing full well that the authors of all this educational philosophy are—can be no other—disappointed men; have lost the "grit" they perhaps never possessed, and have nothing now for the profession but sophistry. Grit makes the good gardener. Influence may get him a situation of high standing; but influence cannot keep it for him. Better the man, better the profession.—R. S.

In to-day's Journal Mr. G. Ash expresses surprise that no "Saul among the people" has arisen to demolish the metaphysical philosophy recently advanced by his confrère "D. W. G." It yet remains to be demonstrated that "D. W. G." dealt any formidable blow to the question wherewith he headed his dissertation. The greater number of gardeners are too shrewd and well educated to give more than mere passing notice to the smart epistle contributed by "D. W. G." They must see that his premises are unsound, and laid down in the form of a very bad type of syllogistical reasoning. This, therefore, friend Ash, is doubtless the chief reason your rather caustic tit-bit did not call for serious refutation. Another, but a much less one, is the fact that "D. W. G.'s" contribution was in reality misnomered. It ought to have been headed either "Gardeners' Failures" or "Gardeners' Grievances." At any rate, the text had little in common with the content, which, by the way, was little else than a tedious contumely on the craft from which he still, it appears, derives his living. Solomon, the good and wise, laid down innumerable maxims applicable to every little crook in the path of youth; but youth prefers its own way. The strange thing is that most people wish to profit by their own experience, and seldom or never care to do so by that of another. "D. W. G." might have known this ere he sat down to concoct the high coloured draught he prepared, doubtless in good faith, for the guidance of youth through the foaming breakers in the sea of fortune. Had he reflected but for a little he assuredly would have discovered that his potential advice would have scarce any influence in bending the current of the stream. The age is progressive; everyone feels the need of self-improvement, perhaps few more than the young diligent gardener and student of nature. Not, however, let it be kept in mind, because the exigencies of his duties call for it, but because he knows that among his fellows he would otherwise become a nonentity, and, besides all this, it makes life immeasurably more pleasant and easier to live.

That education alone is sufficient to achieve success, not only in gardening, but any other trade or profession, is a question few men of intelligence would ever imagine. Does a medical doctor, lawyer, or clergyman require for his profession a tenth of the matter that one or all them require to digest ere they receive the grand prix? It is a well-known fact that they do not; but the process of grinding and cultivating the limbs of the mind, so to speak, is absolutely necessary to form the perfect and capable man. Even these, when all that education is capable of doing for them, often find, like "D. W. G.," that something else is needed. They may then require practice, and this cannot be always got by even the payment of money, but it can be got in a far simpler way—we say simpler with reference to the amount of tact and shrewdness one can bring in evidence—by soliciting the all-powerful and potent services of the goddess Influence. She must be negotiated if one hopes to make any progress on the ladder of fortune. This is a fact which ought to be as clearly set before every individual in life's journey as the journey itself.

Again, we apprehend that "D. W. G." and Co. do not quite

understand what constitutes education or an educated man. Our inference is entirely founded on the statements he has made re the matter with respect to gardeners. If he fancies that a course of college education is requisite for the purpose, he is labouring under a delusion of the grossest nature. The great gospel of education, in principle, is a means to reduce the Beast to a minimum, and where it falls short in partly accomplishing this function it is more a curse than a blessing to possess. It raises the species from their grovelling posture on all fours to the God-like attitude of the perfect man. In fact, it makes a gentleman of the brute, and a wise man of the fool. There have been men in the profession, and there is no reason to think there are not such still, who could teach some of the college professors on philosophy, mathematics, Greek, Latin, and Hebrew, and as regarding the mysteries of physical sciences none could have better opportunities for observation than students whom we may designate "Nature's own students." The prospects of the educated gardener are good. We know some who have graduated to the factor's desk, and several who, on account of their general knowledge of things, were entrusted with the general management of estates. We pray that all who are blind shall obtain light, and those who are ignorant shall understand—the remedy is education.—C. H. S.

### Gardeners' Bothies.

"C. H. S." has got 'em again; he seems to suffer greatly from the "bothy complaint." As the malady is quite fresh to me I cannot hope to advise him on the subject; but I distinctly remember him mentioning once that he had under his supervision an upright tubular boiler. Now, if he will only possess himself of a moderately sized garden, with the usual accessories, viz., range of glass pits, kitchen and flower plots, lawns and fruit plantation, and if this garden can be had about a mile from the nearest dwelling house suitable for lodgers, he will, I fancy, soon grow strong and healthy again. Please don't mention pitch and toss to "fourteen-shilling-a-week men," as I have heard journey-men gardeners termed, for it is wicked to gamble.—H. R., Kent.

### Fruit Supply.

The correspondence regarding the important question of British fruit supply cannot fail to have been interesting to anyone who has this matter at heart. What I am inclined to ask is, Whether the correspondence will lead to anything? The whole matter has been discussed before, and while here and there one sees men who are on the right track, they are like bright stars in a dull firmament, and improvements generally are slow in coming. According to the views of Mr. Raschen and "H. D.," capital is the mighty power that alone can bring about a better state of affairs. It is a reasonable idea, and but for the antiquated British principle of just locking up the laud by primogenitive and other laws there might be a chance for a few millionaires from "the other side" to come over and establish a fruit industry on much the same lines as it is conducted in America. I question whether British capital will do much, and in the meantime our millions are being calmly placed in the pocket of the gentlemen over the water.—WILL S.

### Metallic Pea Trainers.

The scarcity of the necessary wood Pea stakes has for a season or two compelled me to turn my attention towards the metal supports. I was taken by their appearance and neatness, and at once mentally conferred my best praises upon the man who invented such a good substitute for the old unsightly and sometimes incorrigible thing. A little experience of them, however, made me modify my first good opinion, and I am now wondering if any others have discovered any reason to utter a similar grumble as is my fate to do in this respect. My chief fault is the indifferent way in which the Pea and the wires seem to embrace each other. They appear to lack the needed sympathy which results always in perfect satisfaction. The tender tendrils of the Pea clutch to the metal very much after the fashion that the wealthy man grasps the hand of his less fortunate poor relative. The consequence is that many of the shoots fall head foremost to the ground. I have been asking myself why this should be so, and the only feasible explanation forthcoming up to this moment is the action of the atmosphere upon the metal. Iron being a great absorber of heat and cold, it always is sensibly hotter or colder than the surrounding air. In very hot weather the wires get too hot to be comfortable for the succulent tendrils, and should they be attached the heat is powerful enough to burn them. I noticed something very like this during the great protracted heat of last year. The cold this season possibly acts in deterring the tendrils to catch on as we would like to see them. In any case, I should like to hear what is other gardeners' experience in this matter.—D. C.

#### The Japanese Maples' Short Growing Period.

To properly handle and care for plants one must thoroughly know their peculiarities. The Japanese Maple has a character worth noting, in its rapid growth in early spring and its sudden cessation. It takes but three or four days of real warm spring weather to make growths of 5in or 6in length, and when a foot of growth is made, the average plant will stop and busy itself with maturing. This is an important fact for those persons that do odd summer pruning; unless the work is early done it is useless.

#### Cactus Dahlia Aunt Chloe

Is one of the novelties to be distributed in the coming weeks, and it is one of striking qualities. The colour is particularly dark and rich—almost black. The bloom is of lovely shape, its florets being long and pointed. In dark kinds it is not easy to beat Uncle Tom, yet the new one may be considered the more refined. It is not a little remarkable that Mr. Stredwick seems to be the only raiser to effect improvements in the deep-coloured shades. First we had Harry Stredwick, then Night, and more recently the two named above. This new variety is sure to become popular. The growth of all these dark sorts has been so good that, although I have not seen the kind growing, I have reason to believe Aunt Chloe to be equally satisfactory.—W.

#### Hypericum coris.

This, though old, is scarcely known. It is a very neat and compact grower, with glaucous, linear, Heath-like foliage, arranged in whorls around the slender, erect growth, which is terminated by loose clusters of five-petaled flowers, pure golden yellow and quite large for so small a plant, about three-fourths of an inch across and freely produced from June to September. The stems are woody and attain a height of from 6in to 9in with us, rarely ever that. The tips are occasionally winter killed, but as the plants break freely from below, the damage, if any, is soon repaired. A spring shearing is beneficial; the plants start more vigorously when so treated. They are evergreen and succeed in almost any soil with good drainage. It is the daintiest of all the Hypericums.

#### Window Gardening.

There is window gardening and window gardening. There is the window gardening of wealth. Then there are the windows of suburban residents, made gay with blooms matching the trim bed on the little lawn. All this is suggestive of comfort, if not of riches, and of leisured taste, if not of fashion. But about the window gardening in the densely crowded East End there is something of the pathos of the widow's contribution to the treasury—the window is probably that of a room in which a family live, and the one plant is all in the way of floral indulgence that they have. There is something of desperation in such a heroic attempt to keep in touch with Nature, and to feed the eye and the heart with the companionship of one forlorn plant.

#### A Basket of Achimenes.

Certain plants, of which Fuchsias and Zonal Pelargoniums may be taken as examples, are produced in perfection without more than the most ordinary attention; and Achimenes are generally successful with due watchfulness. To produce either huge pans of specimen Achimenes, however, is recognised as deserving special credit, and at the late Beckenham (Kent) show so handsome were some of the Achimenes there that some of the committee thought a Silver Medal award would only have been a due reward to the contributor of them. We figure a hanging basket of these pretty Gesneraceous plants this week, which will help to show how adaptable are Achimenes for such use, and the basket represented is, moreover, a good one, affording a high standard to aim for. The roots may be potted in January or earlier, and grow on in moist, warm pits. (See page 135.)

#### Elderberries for Pies.

It is not very generally known (says "Mechanics' Monthly") that the common black Elderberry fruit makes into good pies. There is often a tinge of bitterness in the eating which alone prevents a similarity to Huckleberries.

#### Thunbergia Harrisi.

Thunbergia Harrisi is by no means a new species, having been introduced nearly fifty years ago; but it is not generally cultivated. The blooms are large and showy, being purplish blue with a pale yellow suffusion in the throat. They are freely produced in racemes, which should be sufficient to warrant at least one plant of this species having a place in every stove.

#### Centaurea orientalis.

Centaurea orientalis is an ornamental, branching plant with twice divided, archingly bent foliage, silvery grey in its younger state. The stems attain a height of 2ft to 2½ft, and the numerous globose flower heads are borne on long, stiff stems, from June to September. Various colours are represented, ranging from bright bronzy crimson, deeper or lighter yellow and sulphur to almost white. It is a desirable cut flower, and easily grown in border or field.

#### Cactus Dahlia Clara G. Stredwick.

This appeared to me one of the best new varieties of last year. It is composed of an unusual number of long, very narrow, pointed florets, and is full to the centre. The colour is not unlike that of the well-known Magnificent—a distinct shade of buff-yellow—bright and taking. But in formation the new one is a great advance, and I shall not be far wrong in predicting that this will be a standard kind both for exhibition and for garden decoration. The life of a Cactus Dahlia in these days of improvement is a short one; yet a distinct advance as this is will in time find its way into every collection.—W. K.

#### Cactus Dahlia Mrs. H. J. Jones.

We find that Dahlias which have flowers of two colours somewhat disappointing; they are not constant. Take Arachne and Innovation. Their crimson and white petals form blooms of especially rich and novel combinations; but on a plant scarcely two flowers are alike—one has more white another more red than their neighbours. Yet, their novelty makes them attractive, and last year several new kinds were noted. The one that pleased me most was the above. The florets may be described scarlet with creamy-white edge; these are plentiful, and are long and narrow, thus forming a large bloom of desirable shape. By the raiser it is said to be constant, and it is therefore a valuable acquisition.—H. S.

#### Pines.

POTTING SUCKERS FROM EARLY FRUITED PLANTS.—Early sorts started at the beginning of the year for fruiting now will have ripened their fruits, and the late varieties will be so advanced in ripening the fruit as to admit of their being removed to a vinery or other house rather cool and dry, which will prolong the season and admit of the successional plants being afforded more room and light to induce a sturdy growth. The suckers from the early forced plants should be taken off without delay, putting them in fibrous loam, rammed firmly into the pots and around the base of the suckers, watering at once if the soil be dry, having in readiness a bed of fermenting materials at a temperature of 90deg at the base of the pots to plunge them in. They root most satisfactorily in a close moist pit, shading until that is effected. In plunging bring the material over the surface of the pots so as to prevent the soil becoming dry near the top, the soil then having sufficient moisture until the suckers have rooted, especially if properly shaded from bright sun and ventilated moderately at 85deg. Do not subject the suckers to overstrong bottom heat. Beds that had a supply of fresh material in the spring will not require any now. They may, however, with advantage be turned to a depth of 20in to 24in; but those that had not a renewal of the material in spring should have an addition of about a foot of new tan mixed with the old to a depth of 18in, avoiding if possible the making of new beds, but if it be necessary 24in depth of new tan will afford all the heat required for the suckers.—PRACTICE.

## An Evening with the Microscope.\*

(Continued from page 83.)

We now come to the sub-stage illuminators, of which the mirror is about the most important and indispensable; and beyond saying that one side is flat for use when there is abundance of daylight, the other side concave for artificial light. The achromatic condenser, which is a combination of lenses, is used in the sub-stage in connection with the mirror and bulls-eye condenser for more fully illuminating the structure of the object. This condenser is fitted with a diaphragm or perforated plate, which revolves for the purpose of increasing or diminishing the light as desired. For dark-field illumination the Wenham Parabola produces some most beautiful effects. The light is reflected from the mirror through the cone shaped parabola at an oblique angle, and is reflected on to the object on the stage. To prevent the light passing direct to the object, there is a stop with a wire and screw thread to regulate it, which cuts off the direct rays and causes the light to be reflected. The object is thus illuminated on a beautiful dark ground.

For oblique illumination, some most beautiful effects are produced by the use of Amici's prism, which fits in the sub-stage, and when using this prism the object should be rotated by the stage fitting. Nashet's prism is also a useful fitting for similar effects, and this can be rotated without moving the stage-fitting. The illuminations of transparent subjects thus obtained on a dark ground are most delightful, particularly in Foraminifera and Polycistina, as the shells appear most beautifully transparent; but there are many others equally delightful when viewed through these prisms.

We will now turn our attention to polarised light illumination, which produces most wonderful effects, and frequently assists in accurate determination of structure, when no other method is of any avail. It is produced by the application of Nicol's prisms of Iceland spar and selenites. The analyser should be fixed above the objective, whilst the polarizer is fixed in the sub-stage, and both should be so that they can be easily rotated; the effect produced by these fittings is simply marvellous. We all know Epsom salts, white as they are, but to see them under polarized light is simply astonishing to the uninitiated microscopist, and by the use of these darkers (selenite plates) thirteen distinct colours can be produced.

There are various methods of holding subjects on the stage during examination. The mineral holder, as its name implies, is for small pieces of minerals; the three-pronged forceps for holding irregular shaped objects, and the stage forceps for holding small objects. These last two fit into a small socket on the stage. The brass forceps are principally used for collecting Algae, &c., both in salt and pond water, as they do not rust. The opaque disk revolver, and forceps with disks are used for examining minute objects, which should be gummed to the disk and rotated under the objective by means of the fine chain, so that all sides of the subject can be examined very easily. The compressors of three different kinds are for holding insects and other objects in a fixed position while being examined; the three live boxes are for a similar purpose, only the insect can be allowed to walk about if desired. The set of three dipping tubes are for catching small insects or animalcules in ponds, &c. The glass trough is intended for holding large insects or other objects in water while being examined. The stage micrometer in brass is to assist in measuring objects. The Maltwood finder is divided by horizontal and vertical lines into 2,500 squares, and used for very minute objects. The frog-plate, with bag attached, is used for examining the circulation of blood in a frog's foot. The animal is put in the bag and securely fastened to one end of the plate, while some pieces of silk are fastened to each claw of one foot, the latter being stretched out over the circle of glass in the plate, and then secured to the pins underneath, to hold it in position. It is then secured to the stage of the instrument, and by means of the light reflected from the mirror, the circulation of the blood is seen with beautiful effect. The pair of glass slips with ledge are for examining drops of blood and other fluids, &c.

To have the full enjoyment of the microscope it is very desirable to have a table that will revolve, so that you are able to invite a friend to share your enjoyment without the wearisome work of getting on and off your seat to make room for him to look down upon the instrument. The revolving part of this table, with race for bicycle balls to run in, and thumb screws, are my own invention. It can be used to revolve, or as a fixed top table, around which six people can comfortably seat themselves, and view the various subjects as long as desirable, without the annoyance of moving. I should say that many of these fittings are modern inventions which I have purchased since I came into possession of the instrument.

(To be concluded.)

\* Paper read by Mr. J. Ollerhead at a meeting of the Wimbledon and District Gardeners' Mutual Improvement Society, February 17th, 1902. The subject being again brought forward on March 17th, after a discussion on Roses in pots.

## NOTES

## NOTICES

### New Park for London.

The Parks and Open Spaces Committee of the County Council have an opportunity of acquiring, for the sum of £25,000, the house and grounds known as Avery Hill, Eltham. The land has an area of eighty-four acres, and contains a mansion with a picture gallery and a large park.

### Testimonial to the Rev. H. H. D'Ombra.

All the friends and admirers of our Nestor of Rosarians will rejoice to hear that the D'Ombra Purse Fund, which was inaugurated by the Dean of Rochester last spring, is now completed, and amounts to the substantial sum of £370. Those who know of the sacrifices made by the presentee in the cause of the Rose, and of the anxieties which have weighed upon him latterly will be pleased to know of the success of the appeal made by the Dean.

### Killed in an Orchard.

A schoolboy at Longdon, a rural district of Worcestershire, came by his death in an unusual manner. Taking one of the farm horses, he rode into an orchard and passed under an Apple tree to pick some of the fruit. While he was in the act of reaching for the Apples the horse must have moved on, with the result that the boy's jacket collar was caught by a broken bough. He thus became suspended in the air, and, being unable to extricate himself or make his cries heard, he remained there until he died. His mother found him hanging dead.

### Rainfall at Temple House Gardens.

The register of rainfall for the month of July was 0.92in, the highest maximum temperature was 83deg on the 14th and the lowest minimum was 38deg on the 11th. Rain fell on eleven days; on the 26th and 27th there was a rough S.W. gale which stripped branches of green leaves from the trees, completely covering the pleasure grounds and gardens with rubbish. The rainfall for July, 1901, was 2.38in, the highest maximum temperature was 88deg on the 18th and 19th, and the lowest minimum 47deg on the 7th of the month.—G. GROVES.

### English Plums Scarce.

The gale which swept the country last week played havoc with some of the fruit crops. Plums and Apples appear to have been principally affected. The trees in many cases were literally stripped of fruit. At Covent Garden it is stated that the Plum crop this year is in a very bad state, consequently prices for English Plums are somewhat high; but ample supplies are forthcoming from California. A large consignment of Californian Plums has been delivered in England and are selling at 8d. per lb. Owing to cold storage the fruit when delivered here is as fresh as when picked from the trees over 7,000 miles away.

### West Indian Fruit.

A direct service of fruit steamers between the West Indies and Manchester, belonging to Messrs. Elder and Fyffes, Limited, has been inaugurated, so far as concerns Manchester. The Chickahoming, the first steamer of the service, reached the Ship Canal docks on Sunday night, bringing 30,000 bunches of Bananas from Jamaica. Mr. A. Rodger Ackerley, a director of the firm, who presided, responded to the toast. He said the opening of the new service had been successful, for they had never had a cargo of fruit landed in England in such perfect condition since they began its importation to Bristol eighteen months ago. Their chief difficulty at present was that Manchester men did not buy many Bananas. Manchester, in fact, seemed to have a prejudice against the Banana which was not shared by other towns. They hoped, however, soon to have sufficient trade to demand a weekly instead of a fortnightly service. Mr. J. K. Bythell, chairman of the Ship Canal Company, said that during the morning 13,000 bunches of the fruit had been despatched from the docks, and by the evening all the cargo would be away. Fifteen waggonloads had been sent to Scotland. He hoped that the next cargo might be carried off by Manchester traders.

**Appointment.**

Mr. John Lowe, formerly general foreman in the gardens of the Right Hon. Earl De Grey, Coombe Court, Kingston-on-Thames, as head gardener to Sir William Vincent, Bart., D'Abernon Chase, Leatherhead, Surrey. Mr. G. F. Welham, for the last eleven years at Rendlesham Gardens, has been appointed gardener to G. H. Garrett, Esq., Alde House, Aldeburgh-on-Sea.

**Botanical Garden for Bradford.**

At a meeting of the Parks and Cemeteries Committee of the Bradford Corporation on August 1, Alderman H. S. Wright presiding, further consideration was given to the question of establishing a botanical garden in one of the parks, and it was decided that such a garden should be made in Lister Park and planted with labelled specimens. The work will be proceeded with at once.

**Sussex Weather.**

The total rainfall at Abbots Leigh, Hayward's Heath, for the past month was 1.69in, being 1.02in below the average. The heaviest fall was 0.28in on the 9th. Rain fell on twelve days. The maximum temperature was 85deg on the 7th, the minimum 42deg on the 3rd, 12th, and 18th. Mean maximum, 72.23deg, mean minimum, 50.18deg, mean temperature 61.20deg, which is 1.80deg below the average of fourteen years. With the exception of a few cold days and nights this month has, on the whole, been favourable. Fruit trees, which were very much checked by insects, are now comparatively clean, and making good growth. Apples and Pears, not half a crop. Plums a blank in some places. Unfortunately Potatoes are badly blighted, second earlies especially, and will be got out of the ground as soon as possible.—R. I.

**Orchard and Bush Fruit Pests**

The Royal Agricultural Society of England have issued a sixpenny pamphlet, written by the Society's Zoologist, Mr. Cecil Warburton, M.A., F.Z.S., with the title, "Orchard and Bush Fruit Pests, and How to Combat Them." After giving the ingredients and the methods of preparation of a few of the most useful and readily mixed insecticides, the pamphlet describes a number of commonly occurring insects affecting the leaves, blossoms, fruits, or wood of orchard trees, including, for example, the winter moth, red spider, Apple blossom weevil, codlin moth, Pear midge, the woolly aphis, and goat and leopard moths, with the best methods of preventing their attacks, of checking their depredations, or of destroying them altogether, where possible. The same kind of information is given with regard to various insects infesting Currants, Gooseberries, and Raspberries, such as the magpie moth, the Gooseberry and Currant saw-fly, the Currant clear-wing moth, the Black Currant gall-mite, and the Raspberry beetle. The pamphlet is illustrated with twelve original woodcuts, and is published for the society by Mr. Murray.

**The Scilly Flower Traffic.**

An adjourned meeting of flower growers of the Isles of Scilly was held in the Town Hall, St. Mary's, on Thursday, with Mr. T. A. Dorrien-Smith in the chair. The object was to further consider the offer of the G.W.R. of a reduction in the carriage of flowers. At a former meeting it was decided to ask the manager of the West Cornwall Steamship Company to attend, and Mr. Banfield (the manager of the company) was present. The carriage of flowers between the steamboat and the station costs 10s. per ton, and a letter was read from a contractor in Penzance offering to do the work for 3s. 6d. per ton, but Mr. Banfield thought the G.W.R. would not accept any other carter than their authorised agent. There is a strong feeling among the majority of the growers in favour of an opposition steamboat during the busiest season, February and March, when an average of one hundred tons per week is sent from the islands, at an average cost of about £3 10s. per ton, to land same at Penzance railway station. A motion, proposed by Mr. F. McFarlane, and seconded by Mr. A. Gibson, that the meeting be further postponed until the manager of the steamship company has waited on the directors of the G.W.R. Mr. F. Tonkin said he was in receipt of a letter from a gentleman offering to put a fast steamboat on for the busy season to run to Penzance, Plymouth, or Avonmouth at his own risk if the growers would promise to give him support. If they wished he would come to Scilly and interview them on the matter. The offer is likely to be accepted. If the flowers were sent to Plymouth or Avonmouth it would save the cartage in Penzance, besides lessening the railway journey.

**Minden Roses.**

The usual celebration of the anniversary of Minden is taking place. Minden was fought on August 1, 1759. In this the Lancashire Fusiliers (then the 20th Foot) took a prominent part. A red Rose is generally worn by the Lancashire Fusiliers on this anniversary. The reason for this is ascribed to a tradition that the Lancashires were posted in or near a Rose garden, and that prior to the fight they decked their hats with Roses.

**Marble Hill Park.**

The Richmond Hill View Executive Committee has, for the sum of £72,000, acquired for a public park the famous Marble Hill estate, which embraces sixty-six and a half acres and a splendid old mansion. The park has a frontage of 2,010ft to a portion of the Thames where boating is exceedingly popular, and the council have obtained powers to provide landing stages on the banks. They have completed arrangements with the owners of the adjoining properties—Haversham Grange, Meadowbank, Meadowside, Cambridge House estate, and the land to the south of Orleans House—with a view of ensuring that these shall not be built upon. They have also entered into negotiations with the Earl of Dysart whereby a certain exchange of land has been agreed to upon the Surrey side of the Thames at Petersham, in order to still further safeguard the unique outlook from Richmond Hill.

**Chelsea Physic Garden.**

About a fortnight ago Earl Cadogan formally opened the Chelsea Physic Garden, laboratory, lecture-room, and curator's residence on the Chelsea Embankment. The grounds known as the Physic Garden had been a subject of curiosity for many years during the nineteenth century, until at last the Treasury instituted an inquiry, which led to a scheme for their management being established by the Charity Commissioners in 1899. The site has been used as what would now be called a botanical garden since the time that the Apothecaries' Society secured a lease of it from Mr. Charles Cheyne in 1673. A wall was built round it in the following year, and the Apothecaries' records show that the garden was "in being" three years later. In 1682 (continues "The Morning Post") the Professor of Botany at Leyden visited it and proposed exchanges of seeds and plants. The year after, four Cedars were planted, one of which survives, but is in a moribund state. At the commencement of the eighteenth century the Apothecaries' Society appears to have had some difficulty in finding sufficient funds for the upkeep of the garden, and in 1712 the freehold changed hands, Dr. Hans Sloane having purchased the manor of Chelsea from Lord Cheyne. One of Dr. Sloane's daughters married a Cadogan, from whom the present freeholder is descended. Dr. Sloane was made a baronet in 1716, and in 1722 Sir Hans Sloane conveyed the garden subject to a rent-charge of £5 to the Apothecaries' Society "to the end that the garden might be continued as a physic garden, and for enabling the society to maintain it for the manifestation of the power, wisdom, and glory of God in the works of creation, and that the apprentices of the society and others might better distinguish good and useful plants from those that bear resemblance to them and yet are hurtful." Conditions were attached to the grant, one of which secured the right of the heirs of Sir Hans Sloane to enter into possession of the property and hold it for the benefit of the Royal Society if the Apothecaries should at any time seek to utilise it for building purposes. During the eighteenth century the garden was in practical use, and with the exception of that at Oxford it is the only botanic garden mentioned by Linnæus in the diary of his visit to this country in 1733. It was in that year that the society erected a statue to Sir Hans Sloane which stands in the centre of the garden. In the early part of the nineteenth century the society found some difficulty in keeping up the garden, but in 1862 it was being largely used by medical students. Towards the end of the century the Apothecaries' Society sought to be relieved of their trust, being unable or indisposed to maintain the garden out of their corporate funds, and the trustees of the London Parochial Charities are now trustees of the garden, which will be administered by a representative committee of management. One great disadvantage attaches to the garden in that it is somewhat difficult of access, neither train, tram, nor omnibus service being available.

## A Visit to a Famous Potato Grower.

In connection with the cattle show held in the Bingley Hall, Birmingham, each year, there is always a considerable amount of space devoted to vegetables. Eight years ago I assisted in awarding the prizes in this section, which was remarkable for the grand display of Potatoes staged. When looking over the exhibits after the judging was completed I was astonished to find how frequently the name of "Wells" was attached to the first prize cards, and both myself and colleague declared that the produce which had won the exhibition such distinction formed one of the remarkable displays of the popular tuber we had hitherto seen, as they were models of shape, large without being coarse, and clear and light in the skin. Since that time Mr. D. H. Wells, of Tysoe, Kineton, Warwickshire, has achieved many triumphs at Birmingham and other shows. I was, therefore, highly gratified to have the opportunity of visiting their Potato grounds a few weeks ago.

Tysoe is no modern hive of bustling industry, but a quiet, ancient village, lying beneath the shadow of the famous Edge Hills. As yet the "iron horse" has crept no nearer than five miles from it, and at this point there is only a single line of rails, and between the company which owns it, and another which runs a great trunk line near, there seems to be a studied disregard for the convenience of travellers. Tysoe, however, possesses splendid natural advantages for horticulture, as the soil is for the most part a deep loam of medium texture, in a few instances somewhat heavier, the district being an early one. With the establishment of rapid communication with other parts it must become a great centre for market gardening. I must, however, not dwell upon generalities, but pass on to the Potatoes. Although the soil is good it is not to that alone that success can be attributed, but rather because it receives that thorough culture necessary. Mr. Wells believes in deep digging. He obtains a special spade for the purpose, which is long in the blade, somewhat narrow and light, so that the workman can force its whole length straight into the soil. Soot is the principal manure, and heavy dressings of this are applied at digging time, and again before the Potatoes are moulded, and to this, in conjunction with well worked soil, Mr. Wells attributes the clear skins of his produce.

I have always been an advocate for giving Potatoes plenty of room, but the Tysoe exhibitor goes further in that respect than I have seen anyone else go. The early varieties are planted 2ft apart each way, the late ones 2ft from set to set, the rows being 2½ft apart. With this wide planting there is plenty of room for the air to circulate freely around every plant, with the result that the tops are short-jointed and hard. In many cases they are strong enough to stand perfectly upright, and the tops of most varieties are decidedly shorter than when grown under ordinary conditions. Under this system of culture all varieties are to a great extent disease resisters. Unlike many other cultivators, Mr. Wells does not favour the early planting of late varieties; he considers from the beginning to the middle of May to be the most suitable period, because by the time active growth above ground is in progress the cold weather has usually passed, and the growth is regularly continued without check. My own opinion is that on shallow soil earlier planting is advisable, because during hot seasons growth is considerably curtailed unless the plants have made good progress before dry weather sets in.

At Tysoe great care is taken in selecting tubers for seed. Those which are the result of secondary growth are always rejected, because from a series of experiments it has been found that such late formed tubers seldom if ever ripen properly. If planted they often start strongly, but after a time the tops become stunted and quickly turn yellow. When crops are dug these "secondary" tubers are often just the right size for seed, and Mr. Wells considers that using them for that purpose is often the cause of unsatisfactory crops. He also finds it a great advantage to have at command soils of varying degrees of texture, because different varieties of Potatoes seem to vary much in regard to their requirements. Those which do not succeed on the medium loam at Tysoe usually thrive splendidly when planted on rather stiffer soil, and vice versa.

Tubers of wondrous size are often obtained from plants

having extremely short tops; nor is this peculiarity confined to the present season, as Mr. Wells informed me that the finest samples of Mr. Bresee he ever grew were obtained from plants whose tops were not more than from 9in to 12in in height. All over the country Potatoes have this season grown very irregularly, owing, no doubt, to the cold, wet weather experienced. This state of affairs was only noticeable in a few instances at Tysoe, being the most pronounced in the case of "Ideal."

Mr. Wells speaks very highly of Telegraph and Express among early Potatoes. He also considers Sutton's Favourite, Reading Russet, Reliance, Satisfaction, Ideal, Edgemoor Purple, and Supreme to be excellent varieties for exhibition purposes, as well as for the production of heavy crops for general purposes. Motor is considered the finest late variety. Several of Webb's seedlings are this year being grown. Nos. 1, 2, and 3 appeared to be growing exceptionally strong. No. 5 appeared to me to be a variety of the right type, because although the tops were very strong, they were upright, and we certainly want to get away from those late varieties which have such a spread of top growth.

So far I have only been able to judge of this year's prospects from the appearance of the growth above ground, but I hope to visit Mr. Wells again when digging is in progress, and I shall be much mistaken if I do not then see highly gratifying if not sensational results.

Mr. D. H. Wells is the exhibitor, but in reality there are two brothers connected with the Potato venture, and it is difficult to say which is the more enthusiastic of the two. Working together in perfect harmony, they are doing a good work by showing what can be done with that neglected commodity "land," when energy and good work are brought to bear upon it. To each I tender my heartiest thanks for their ready information and kind hospitality.—H. D.

## The Ubiquitous Microbe.

A correspondent, signing himself "Docteur Ox," strikes a warning note to readers of "Le Matin," and explodes a popular fallacy so fondly cherished for ages past respecting the virtue of town and sewer refuse as a manure for the soil of the country. This, he states, is due to a recent decision of the Minister of Public Works, prohibiting the cultivation upon soil watered with sewerage, of vegetables and fruit destined for raw consumption.

Is sewerage then no longer the most perfect and inoffensive of fertilisers? And the soil of the country, is it no longer the purifying filter it has for all time been thought to be? Vegetables cultivated in this purifying (?) soil are then capable of absorbing microbic germs which ought not to be found there? Fifteen years ago it would not have been well with the individual who had dared to pose such questions, for at that epoch it was duly and firmly believed that

(1) The cultivated soil is the best of filters, in fact, the ideal filter, since not only does it not permit the passage of microbes, but it destroys them. And as proof of the fact, the water flowing in the drains of Gennevilliers was so pure that the members of the official commissions partook of it, and declared it far superior to the best of table waters.

(2) That, moreover, "pathogenous" microbes did not get on very well with the "saprogenous" microbes which polluted sewer water, and that these delicate and aristocratic mischief-makers were unable to support the sickening promiscuousness of the vulgar bacilli of putrefaction, and that in contact with these latter, the former quickly perished.

(3) That the rootlets of plants are also the elective filters which preclude the passage of bacilli lurking about in their neighbourhood. This, moreover, had the endorsement of eminent bacteriologists, who, themselves, cultivated vegetables in soil watered with sewerage, and upon the most careful examination failed to find the least trace of microbes.

Coming from a Government Commissary, these facts seemed weighty enough to dispel the deepest rooted misgivings in any who may have entertained them. But to-day we are rudely awakened to the disagreeable fact that vegetables grown upon soil watered by sewerage are sources of danger, and should not be eaten raw for fear of microbes. Truly this is rather hard. By way of consolation, however, the danger for the present seems to be limited to vegetables which grow about the level of the soil, such as Radishes, salads, &c. Such as grow at a distance from it, like Tomatoes, Artichokes, &c., do not—at present, at least

**Thunbergia Harrisi.** (See page 127.)

—fall under that category. Still, there seems little assurance that later we may not hear that these, like their low-lying kin, may be yoked with the same curse. 'Twould be well to beware, for this opinion may yet undergo some modification.

Sewer water most assuredly does contain pathogenous microbes, and what is equally as sure, they do not become devoured by their saprogenous comrades. And the rootlets of vegetables and plants, ignoring their elective functions, absorb all with the same indifference. Not many months ago a German bacteriologist was curious to know what was the ultimate fate of the tuberculosis bacilli when they finally found their way into the sewers. One might be pardoned for hoping that they became drowned or asphyxiated. But no such luck; far from it; they thrived better there than in the open air or in river water.

It is upon the virulence of a microbe that its vitality depends. For, whereas in river water the virulence of the tuberculosis bacilli is practically nil at the end of ten months, in sewer water it has been found as active at the end of ten months as it was the first day. This same bacteriologist, having met with success in that quarter, was encouraged to ascertain what fate awaited Koch's bacillus when introduced into cultivated ground. Did its virulence become modified? Was it destroyed? Not a bit. He sowed Radish seeds in a flower pot and watered them with sewerage containing tuberculosis sputum which he had previously preserved for forty days. Three months later he found in this cultivated soil the tuberculosis bacilli in all their virulence.

Recently two distinguished French bacteriologists, Messrs. Bourges and Wurtz, have pushed these experiments still further. They resolved to see if it were not possible to find the Koch bacillus in the Radishes, &c., sown in tuberculated soil. To this end three flower pots were filled with soil and sown respectively with Radish, Lettuce, and Cress seeds. They were duly sprinkled from time to time with water containing the Koch bacilli. At the end of a certain period portions of leaves were broken off and inoculated into the peritoneum of several guinea pigs. In eighteen out of thirty cases the results were positive—that is to say, that the tuberculosis bacilli had passed from the soil in which the seeds had been sown into the leaves of Cress, Radishes, and Lettuce. Messrs. Bourges and Wurtz have made a similar experiment with the bacillus of typhoid fever. This time, not eighteen out of thirty, but in every case the bacillus was found with the greatest facility in the leaves of the vegetables experimented upon.

Not only do vegetables absorb microbes, but their process of progressive development assists in drawing the microbial germs from a considerable depth to the surface of the soil.

Pasteur had already demonstrated that in the field of Beauce (Indre-et-Loire) it was the worms which played the rôle of exhumers of microbes, and, bringing to the surface the anthrax spores interred with the sheep which had died of the disease, maintained in that region an epidemic of anthrax. According to Drs. Bourges and Wurtz, plants and vegetables can play exactly the same rôle, and bring to the light, along their stems and leaves, the microbes buried in the depth of the soil.

It is thus easy to account for the periodic epidemics of cholera or choleric diarrhoea, which up to the present have, by their sudden and unaccountable appearance, so perplexed epidemiologists. Whilst this authenticated and interesting experience will be welcome to the epidemiologists, it will be a sorry blow to lovers of Radishes, salads, &c.—("Pharmaceutical Journal.")

## My Four Days' Holiday.

Leaving Swansea by early train on a Tuesday, and passing through many towns, and the country now in its beauty, I arrived at my journey's end. When I alighted at Fareham, distant from Southsea nine miles, I soon found good accommodation, and much enjoyed the refreshments after my long journey. The population of Fareham is about 8,000, and the main street one mile long, planted with Poplar canadensis.

After a rest, I took a stroll round the town, which brought me to a river running to Portsmouth Harbour. Portsmouth's shipping trade is mostly in timber, coal, and flower pots. The shipments from here are mostly pots for the Jersey growers, and no better pots in England are made than those by the Fareham Potteries, the clay being the finest in England. My walk brought me to these potteries, where I soon was introduced to Mr. J. Sandy, J.P., the proprietor. Years gone by Mr. Sandy sat at the bench making pots himself; now he is chairman of the Urban District Council, and of the School Board and other societies connected in the town, and employs more labour than any other firm in this place. I may say from what I gleaned that Mr. Sandy is very popular. Should any of my brother gardeners visit Fareham, it is very interesting to see

how pots are made from size one up to ninety. I thanked Mr. Sandy for the kind way he received me, and, wishing him adieu, I adjourned to my lodgings for the night.

On the second day I was out early and made my way to the Swanwick Strawberry grounds, a distance of six miles, where was seen at the station no less than one hundred fruit vans and hundreds of thousands of baskets for Strawberries. No less than eighty tons in one day have been sent away from Swanwick alone. Strawberries were late. I bought one gallon on my visit, and paid 7s., and I am told the first picking fetched 12s. per gallon. Most sorts are grown, but Nobles and Sir J. Paxton more so; and some are introducing Sir Chas. Napier for late supply. It was a sight to see them. They were all just getting into picking order, and with the favourable weather record crops have been realised.

Bush fruits and Plums are extensively grown, and there is a good set.

After a good rest on Sarisbury Green, I wended my way into the main Southampton Road, planted for one mile straight on each side with Firs. On my right I came to the gardener's lodge at Coldeast House, the residence of C.G. Montefiore, Esq., on entering which I found Mr. Chapman, the steward and gardener, at his office. My walk of about one mile down the carriage drive brought to view fine specimen Rhododendrons in named sorts, all at home in a peaty soil. I noticed fine specimen Abies Douglasi, A. Veitchii, A. amabilis glauca, and Retinospora obtusa gracilis aurea. I also saw the model stables, the clock pointing to 4 p.m.; thence to the entrance of the gardens, which brought me to Mr. Chapman's office as stated, and we were soon "at home." Mr. Chapman was pleased to show me round for about three hours. We came to the frame department, where Melons Windsor Castle and Blenheim Orange are well set. Other frames had just been emptied of early Potatoes. There is also a late lean-to Peach house, all the trees well set. In the stove I found Caladiums done well; also Dracaenas and Crotons of good colour, with fine Clerodendrons, Palms of all sizes, and a fine batch of Cœlogynes, also a good collection of choice Ferns.

We passed on to the walled kitchen gardens, the north wall covered with Morello Cherries, fine crop. On entering the doorway an arch about 100ft long presented itself, and this is covered with Wistaria sinensis and Roses of sorts. On the left is the long early Peach and Nectarine house with Early Grosse Mignonne and Royal George Peaches, Pineapple and Victoria Nectarines. These trees were planted thirty years ago by Mr. Chapman, and they carry a fine set. In the central borders were Sutton's Seedling Marrowfat Pea, six peas in a pod, and all good. The early Black Hamburgh viney was carrying fine bunches and finishing them well. Muscats were good, Mrs. Pince likewise, and no cracking. I never saw such foliage on Vines. Black Hamburgh and Alicante had also a good set.

We now come to the pleasure lawn. Roses are grown by the thousand for cutting. I noticed a fine bed of 150 plants of Papa Gontier (grand), Souvenir de Catherine Guillot, Vistss. Folkestone, Grace Darling, and Enchantress. There were five mounds of hybrid Rhododendrons and specimen Cedars. The mansion is built in the Italian style, and the front planted some thirty years ago with Ampelopsis Veitchii is now completely covering the front and looks grand.

From the terrace one can see Osborne House and the Solent, the evening sun shining on the briny waters. Looking to the right you see Netley Hospital, one of the finest buildings in England, where our invalids are landed on coming home from foreign service. Walking still further brought us to the farms of 500 acres. The late Mrs. Montefiore took great interest in her gardens and was good to the parish. It was now nearly time to catch my train, so after refreshments with Mr. Chapman I thanked him for his kindness and hospitality, and thus ended my second day's outing.

On the third day's holiday I took train to Portsmouth town and viewed H.M. dockyard, a sight worth seeing. Thousands of hands are here employed. From thence I took the electric ear which brought me to Clarence Pier, and heard a splendid concert, then walked about two miles on the Esplanade, which gave a fine sight of the ships. I made my way through Palmerston Road (a fashionable part of Southsea) to the new Town Hall, and closed up with going to the new Theatre Royal.

On the last day of my four days I was up with the lark, and found out the nurseries of Messrs. W. G. Droyer, whom I found very busy finishing the potting up of their specimen Chrysanthemums for large bloom. I should think about 800 plants are here, ranging from 1ft to 3ft high. Mr. W. Droyer, the senior partner, showed me round. Their specialities are Roses, Gardenias, Adiantums, Ferns and Camellias. Having seen all, I left and took excursion to Southsea, and went through the Fleet, a sight I never shall forget. I returned home by the excursion train, arriving at Swansea in the early morning. I would advise any gardener, who has the privilege of a holiday, to go down south. All Hampshire people are very homely. Thus closes the record of my four days' holiday.—SWANSEA.

#### Watering, Feeding, and Selecting Buds.

The most important items just now connected with the culture of Chrysanthemums in pots for exhibition and decoration are watering, feeding and top-dressing, also securing growths, selecting buds, and keeping the plants clear of insects.

The matter of watering is very important, and claims constant attention, especially where a large number of plants are grown. This attention must be systematic, examining the plants thoroughly, in order to see whether water is or not needed. A superficial or casual glance at the pots may often be sufficient for the expert, but the amateur grower needs to be more particular to satisfy himself thoroughly. The experienced grower, however, is always on the alert when making a regular round of the plants. The casual look will not always do, and he must perforce halt to make a more minute examination of the soil. The soil might be to all appearance moist, yet on closer survey water is found to be required. In a batch of plants, comprising various varieties, there are always some of stronger growth, and having a more powerful root system than others. It is these which need more frequent supplies of water, while weaker growers do not need it quite so often.

While on the subject of watering, it is as well to emphasize the fact that water when applied should be given thorough enough to moisten the whole ball of soil and roots, then wait until a similar application is required again. The expert cultivators of course do not need the reminder, as it is an ingrained principle which they seldom overlook. During dry days in the present month the supply of moisture to the roots largely governs the extent of success at the blooming period. Neglect will assuredly tell sooner or later.

Though water is of great moment, it is not advisable if it can be avoided, to use it direct from a cold well or spring or water tap. Means should be provided whereby a few hundred gallons can be exposed to air and sun, so as to become warmed before using. Soft water, if obtainable, is better than hard.

Regular attention will prevent weeds establishing themselves on the surface of the pots. They necessarily abstract food from the soil as well as moisture, impoverishing the material into which a mass of healthy, sustaining roots should permeate for the welfare of buds shortly to form and swell. The filling of the pots with roots furnishes a good opportunity to give the plants a little new rooting material in the shape of a mixture of rich soil, consisting of loam, decayed manure, bonemeal, scot, and superphosphate. A dash of each of the latter will suffice. Apply a layer of this half an inch thick, and press down firmly. A decided impetus to root action will be given, and a mass of young fibres will ramify in the soil. It will be necessary to water the plants with a rosed can for a time, or the soil is liable to be washed into holes. Plants thus treated will not require liquid manure for some time.

As regards general feeding with liquid manure and artificials, it is not desirable to stimulate too frequently at first, nor commence much before buds appear. An occasional weak dose of soot water or a light dusting of an approved Chrysanthemum manure may be given. Soot water made clear by adding lime to it so as to clarify it is useful for occasionally syringing the plants during hot and dry weather. Giving it to the roots in this state is better than when thick.

Stimulants should be varied as much as possible, thus giving the plants a change of food which they will appreciate. Some manures are better adapted for hot weather than others, but no stimulant other than pure water must be applied when the soil is very dry. Nitrate of soda is a stimulant that may be used occasionally only. Dissolve a pound in a gallon of water, and when watering use  $\frac{1}{2}$  pint in 2 gallons of water. It is best used in hot weather. Thomson's and Clay's fertilisers, however, cannot be bettered.

A natural manure with cooling qualities is cow manure. A peck of this in a tub containing 25 gallons of water will make a suitable stimulant. Horse manure makes the best liquid manure for use in wet weather.

Powerful liquid manures may be made from sheep and fowl manure, using about a peck to 30 gallons of water, enclosing the manure in a bag, which sink in the water. It is best to give these strong manures later when the plants have become used to receiving extra food. Avoid the mistake, however, of applying any manure too strong.

A further change of stimulants may be found in the various general artificial manures, using them in solution or by dusting

lightly on the soil at the rate of about a tablespoonful to an 8-inch pot, watering in immediately.

No hard and fast rules can be laid down as to how often to apply manures. During normal weather, when watering is frequently necessary, twice a week ought to suffice, but some varieties will require it oftener. It is best to err in the early part of the bud-forming season on the side of safety. All stimulants can be applied oftener when given weak.

The securing of the growths to prevent damage must be strictly carried out, removing, too, any shoots of a superfluous character, such as side growths on the stem, or suckers at the base.

Selecting or taking the bud which is to develop into the flower must be proceeded with as they appear, rubbing out the side growths surrounding them gradually. One bud on a shoot is enough where large blooms are coveted, hence select the first or second crown bud. These usually appear from the present time onwards, some being early, others rather late. The last buds of all are the terminals, the majority of these not showing until the plants have completed growth in September and October. Good flowers are obtained from these, though upon the whole, smaller in the case of the large Japanese varieties. In the Incurved section, the best flowers are usually grown on the terminal bud.

In regard to the early flowering varieties, the plants are for the most part grown free, allowing them to develop the terminal shoots with clusters of buds. Retain the central one of the cluster, and thin out all but one on each branchlet or side stem. This results in bright, medium sized blooms. With this treatment the Pompon and small flowered varieties perfect excellent clusters of flowers which are much appreciated for cutting for table and vase decoration.—E. D.

### Specialities at Wordsley.

All interested in the production of new and improved vegetables and flowers, and their progressive culture, will find much to interest them in Messrs. Webb's grounds at Wordsley at this time. On a visit there recently, I found excellent work going on, and I was much gratified with many of the results. Tomatoes in pots under glass are extremely fine; indeed, I never saw better plants. They are growing in 10in pots, trained to a height of 4ft or 5ft, with a single stem, and every one is furnished with large clusters of fruit of great weight and fine form. There is no trace of disease, and all are most healthy, much more so than is usually seen when the plants are planted out. Coronation, a new variety introduced this year, is superabundantly prolific; it is red in colour, of medium size, and of superseding quality. Regina is larger, and bears equally well. The older Sensation is larger still, and a splendid type for exhibition. Jubilee and Chancellor also stand out conspicuously, and as a yellow fruiting kind Sovereign is perfect in form and an abundant bearer, possessing a flavour which finds much favour amongst growers.

Peas are also a leading crop. This year there are 120 varieties on trial. Some are excellent, others useless; but the result of the trial will be of the utmost service in conclusively indicating what to recommend and what to avoid. No special favours are shown to the firm's own varieties, but some of these come out well. Senator, raised at Wordsley some years ago, has recently been awarded a First Class Certificate by the Royal Horticultural Society in the Chiswick trials, a distinction it well merits. It attains to a height of about 3ft, is enormously prolific, with medium sized, well-filled pods, and the seeds when cooked are delicious. Wordsley Wonder, an old favourite with the public and the writer, still shines as a good one amongst all. Senator and this are two of the best market Peas. As a tall growing sort, Stourbridge Marrow is an excellent type, being strong in the haulm and an abundant bearer. Masterpiece eclipses that well-known variety, Ne Plus Ultra, in flavour, which is a strong recommendation. Chancellor, Royal Standard, and Mainstay are all main-crop varieties of great merit. A new variety, not yet in commerce and unnamed, need not be detailed; but having seen it two years running, I am convinced there is a coming main-crop Pea of inordinate properties in store for us.

Lettuces have been a speciality with me for long. Their cultivation and use is on the increase, and rightly so, too. Few, perhaps, have tried them as a boiled vegetable, but they make a delicious dish. A splendid batch of them is now to be seen at Wordsley. There are large brakes of about a score kinds—all were sown and planted at the same time. Some are now running to flower, others are in perfection, and it is these we want, as a Lettuce that hearts, and is quickly over, is never serviceable. Some of the Cos varieties fold nicely; others produce a tuft of leaves which show little disposition for this, unless tied, a process that never brings as good and crisp a Lettuce as the

natural fold. Some of the Cabbage Lettuce had hearts almost as large as a soup plate, and hard and clean. Criterion, Paragon, and Summerhill are such, and no one could imagine or desire finer varieties. As a smaller and more compact variety, Model is perfect. The best of the Cos varieties were Wordsley Gem, Monstrous White, and Exhibition. These are all self-folding, and fine in size and form.

Broad Beans were most interesting. Some had grown well and clean, while a neighbouring kind had been nearly a failure in growth, and quite unprofitable. It can hardly be imagined that Broad Beans are so varied in constitution, yet seen here it would appear that some are subject to the fly and others not. The most healthy and productive were the gigantic Green Longpod, Mammoth Longpod, and Improved Windsor.

Emperor Cabbage is one I have grown for many years, and the annual demand for it is so increasingly great that it is treated as one of the best; and I certainly give it this distinction, both in my own garden and as seen at Wordsley. It is right in size and quality, and displays no freaks. The acres of it now maturing seed at Wordsley indicate the demand it has.

In the glass houses, Gloxinias and tuberous Begonias are really grand in development and colours, and afford seed which produces plants that charm all who grow them. As indicating the substantial way they are grown, I was shown plants that had recently been at Aberdeen, at the Highland Society's exhibition there, and the long journey had tarnished them but little. Thousands of young Cinerarias and Primulas in frames made me wish I could see them in flower, when that occurs.

Here, as everywhere, Sweet Peas were in crowds, and over 100 varieties were represented. Some were fading, others were at their best, with later ones coming on. Seeds for the earliest are sown in the open in November. These flower at the end of May or early in June, and the spring-sown ones follow. But the Wordsley firm think there are too many varieties being offered, and I agree with them. All are certainly not distinct and of special merit, and it is with the object of securing the very best only, and offering a careful selection, that the trial is going on.

Stocks were in their first flush of beauty, and a magnificent display, both in colour and form, was seen. How charming a good selection of these are! Seedling Carnations are a special feature. The plants are well grassed, and have abundance of strong, well thrown up stems, and blossoms in arnfuls. Ninety per cent. of them come double-flowered. Individually, the blooms are as large and purely coloured and formed as those of named varieties, but they have far better constitutions than the latter, and as furnishing cut flowers they are invaluable. These hardy seedling Carnations are rarely affected with the ills which many of the named kinds fall into and they cannot be too extensively grown. Amongst Tropæolums Webbs' New Meteor, as seen in long ribbon borders, is the most true and compact of the class, and its innumerable flowers are such a bright scarlet as to suggest it is a substitute for the everlasting "scarlet Geranium."—AN ESSEX GROWER.

## Societies.

### R.H.S., Scientific Committee, July 22nd.

Present: Dr. M. T. Masters (in the chair); Messrs. Hooper, Odell, Nicholson, Worsdell, Bowles; Drs. Müller and Cooke; Revs. W. Wilks, and G. Henslow, hon. sec.

*Leucoium droppers*.—Mr. H. H. Benton Bradley, of Sydney, sent additional illustrations of bulbs of *Leucoium*, showing two bulbs, one above the other; also similar bulbs artificially separated and both growing when planted.

*Prairie Bean*.—Mr. Wilks showed specimens from Kansas, remarkable for flowering before the leaves appear. They were referred to Mr. Nicholson.

*Paris with variable number of Leaves*.—Mr. Odell showed several flowering stems with five leaves instead of four. The number is constant on the plant. The late Prof. J. S. Henslow wrote a paper on "The Varieties of *Paris quadrifolia*, considered with respect to the ordinary Characteristics of Monocotyledonous Plants" (London's Mag. Nat. Hist. vol. v., p. 429, 1832).

*Kleinia*.—Mr. Odell also showed specimens of this S. African plant, in illustration of its climbing habit.

*Peperoma*.—He also brought specimens of a minute species from Burmah.

*Bulbs pierced by Couch Grass*.—Miss Willmot forwarded specimens. The process is described as done by a ferment secreted by the tip of the rhizome, by M. A. Prunet (Sur la perforation des tubercules de pomme de terre; Rev. Gén. de Bot., avec illustrations).

*Plum with foliaceous Calyx*.—Mr. Hooper showed some blossoms of a Victoria Plum tree with small but distinctly leaf-like sepals.

*Nectarine-Peach*.—Dr. Masters received a fruit from Mr. Rivers, one-third of the skin being that of a Nectarine, and the rest that of a

Peach. It came from a Peach tree raised from the stone of a Nectarine many generations ago.

*Sugar Pea*.—Mr. Eckford sent examples of this Pea, remarkable for its semi-succulent, edible pod, known in France as *Pois sans parchemin*. It has produced three varieties, cultivated in France.

*Poon-yet Resin*.—Dr. Cooke read an account of this resinous-like substance prepared by bees in trees in Burmah. Their nests are entered by small passages lined with the resin, which is continued outside in the form of a trumpet. It is probably formed by a mixture of substances.

*Potatoes diseased*.—Some small tubers were sent by Mr. Eckford, which Dr. Cooke undertook to examine.

### Royal Horticultural—Drill Hall, August 5th.

There were but few exhibitors at this show, doubtless owing to the Bank Holiday and the general season of recreation. The quality of the exhibits staged was well up to the usual standard, and must have well rewarded any who paid the show a visit. Messrs. Wm. Bull and Sons' Crotons were very fine, and attracted a good deal of attention. Carnations were very much in evidence, but only as cut specimens.

#### Fruit Committee.

Present: Messrs. H. Balderson, Jos. Chéal, W. Baxter, S. Mortimer, Alex. Dean, Wm. Pope, Horace J. Wright, George Kelf, J. Jacques, J. Willard, A. H. Pearson.

*Fruit Committee, List of Awards*.—Gold Medal to Miss Adams, South Villa, Regent's Park, N.W. (gardener, Mr. Geo. Kelf), for collection of fruit; Silver Banksian to Messrs. Harrison and Sons, Leicester, for culinary Peas; Silver-gilt Knightian to E. A. Hambro, Esq., Hayes, Kent (gardener, Mr. Beale), for Black Hamburg Grapes.

On plates in the foreground Peaches, Bellegarde, Royal George, Barrington, and Dr. Hogg, were represented by nicely coloured and even sized fruits; Melons, Hero of Lockinge, Frogmore Scarlet, and Sutton's Scarlet; Grapes, Black Hamburg, Buckland Sweetwater; Raspberries, Superlative, together with Gooseberries, Plums, and Cherries in variety, were all in splendid form. The entire collection was a fine illustration of what can be produced in the proximity of smoke and other conflicting difficulties, all the specimens being from within two miles of Charing Cross. Palms, Crotons, and other stove plants were used to effect on the stand.

Mr. William Beale, Hayes Place Gardens, Hayes, Kent, sent six finely coloured and finished bunches of Black Hamburg Grapes. Two of the bunches exhibited must have scaled nearly 6lb each, and they were the produce of a Vine known to be about 100 years old, and, judging by them, the Vine must be in splendid vigour.

Miss Adamson, South Villa, Regent's Park, N.W., (gardener, Mr. G. Kelf), again exhibited one of her characteristic collections of fruit. The exhibition was backed by Plums in variety in 14in pots, well furnished with fruit, and looking in fine condition.

Messrs. Harrison and Sons, Leicester, were represented by seventy-seven varieties of culinary Peas, many fine pods being staged. Telephone, Duchess, Magnum Bonum, and Sutton's Seedling were worthy of special note.

Messrs. Laxton Bros., Bedford, sent a box of their new late Strawberry Trafalgar, a cross between Latest of All and Frogmore Late Pine. The fruit is of good size, even in form, but the colouring pale. It remains to be seen if it will prove a good traveller, but its appearance would not appear to warrant that quality.

#### Floral Committee.

Present: Messrs. Wm. Marshall, H. B. May, Geo. Nicholson, John Jennings, Jas. Walker, J. F. McLeod, J. Reuthe, C. R. Fielder, Charles Dixon, F. Page Roberts, J. W. Barr, W. P. Thomson, Charles E. Shea, E. H. Jenkins, W. J. James, J. H. Fitt, Harry Turner, Wm. Howe.

*Floral Awards*.—Silver Flora Medal for group hardy flowers, Mr. M. Prichard, Christchurch, Hants; Silver Banksian for group of Zonal Pelargoniums, Messrs. Hobbies, Limited, Dereham; Silver Banksian for group of Phloxes, &c., Messrs. T. S. Ware, Ltd., Feltham; Silver Banksian for group of Carnations, Mr. C. Turner, Slough; Bronze Banksian for group of Carnations, Mrs. M. V. Charrington, Edenbridge; First Class certificate to Libocedrus, macrolepis, a fine species of delicate green colouring, glaucous on lower surface of leaves and branches. The general appearance is not unlike a large species of Selaginella, Messrs. Jas. Veitch and Sons, Limited, Chelsea. F.C.C. to Astilbe chinensis (max), var. Davidi (Franchet), a splendid variety about 5ft in height, with large but much divided foliage. The flowering spikes are borne well above the foliage, and the flowers are of a beautiful rosy mauve colour, and very light and feathery. Award of Merit to Carnation Bookham White Clove, a variety with a delicious fragrance and of firm form, Mr. Jas. Douglas, Bookham. Award of Merit to Carnation Cedric, a yellow ground with reddish crimson markings.

Award of Merit to border Carnation Mrs. Leigh White, a very vigorous white with delicious fragrance.

Lord Ilchester, Holland House, Kensington, sent *Eichornia crassipes*, an aquatic plant seldom seen in bloom. The colour is mauve; also *Hibiscus rosea sinensis* brilliantissimum in fine form.

Lady Ardilaun, St. Anne's, Clontarf, Dublin (gardener, Mr. A. Campbell), sent several vases of good quality border Carnations.

Messrs. Hobbies, Limited, Dereham, were effectively represented by a fine collection of Zonal Pelargoniums in variety. Cut blooms were arranged in vases and stands of several descriptions, and the decorative value of this flower well illustrated. Amongst those of special merit were Mrs. Ashworth, a semi-double white; Mrs. Corder, a rosy salmon; Aquarelle, pink and white, and double Jacoby. Many others were shown, and the use of

A Basket of Achimenes. (See page 127.)

*Asparagus Sprengeri* and *Coeos Weddelliana* added much to the general effect.

Mr. M. Prichard, Christchurch, Hants, staged a large collection of hardy flowers of much merit. The *Gladioli* at one end of the exhibit were well worth noting, and *G. Demi-Deuil*, a violet; *Menelik*, a rich crimson; *Lacordare*, brilliant red, were fine specimens of this flower.

Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, sent hardy flowers and shrubs, amongst the former *Aconitum bicolor* and *Draacocephalum virginicum album* were in good form. The same firm also staged Sweet Peas and *Cactus Dahlias*, William Jowett, rich crimson, and Mrs. A. F. Perkins, a primrose and white, being good examples of the last named.

Mr. E. Potten, Camden Nursey, Cranbrook, Kent, had a nice collection of hardy flowers, chief amongst which were *Gaillardia grandiflora hybrida*, *Trollius europæus Improved*, in splendid form. *Achilleas*, *Spiræa*, *Pentstemons*, and *Phloxes* in variety were also shown; a bright and attractive little exhibit.

Messrs. T. S. Ware, Limited, Feltham, were represented by a group of *Phloxes* of many beautiful colours and shades, chief amongst those which called for attention were *Stendal*, a lovely cerise; *P. Selection*, a rich mauve; and *Pacha*, a dwarf pink; *Delphiniums*, *Lobelia cardinalis*, *Agapanthus umbellatus*, and *A.*

*umbellatus alba*, together with many other well known hardy plants were shown, and a very effective and pleasing stand was thus obtained.

Messrs. J. Peed and Sons, West Norwood, staged a collection of *Achimenes* in variety, backed by Palms, *Abutilons*, and variegated *Acacias*; amongst those of special merit we noticed *A. longiflora alba*, white with purple colouring at the top of tube; *A. Lavender*, a good sized mauve; and *A. Verschaffelti*, a smaller flower with purple stripes on a white groundwork. The old variety, *A. eoccinea*, was represented by nice floriferous specimens.

Mr. Charles Turner, The Royal Nurseries, Slough, sent six dozen cut blooms of Carnations. *Agnes Sorrel*, a self crimson, was a nice flower. Amongst the yellow grounds, *Duke of Alba* and *Artisan* are fine flowers: large size and good quality were much in evidence.

Messrs. Wm. Bull and Sons, Chelsea, staged a collection of *Crotons*, whose health, vigour, and brilliant colourings in many varied forms reflect great credit upon this old and well-known firm.

Messrs. Barr and Sons, Long Ditton, sent *Lathyrus latifolius* Apple Blossom, very similar to *L. delieatus*, also *Reseda alba*, a hardy herbaceous Mignonette, and many other interesting plants.

Messrs. B. R. Cant and Sons, Colchester, had two vases each of *Roses*, those being the new Tea Mrs. B. R. Cant, and H.P. Ben Cant, now too well known to need comment.

Messrs. Phillips and Taylor, Lily Hill Nurseries, Bracknell, Berks, staged about fifty varieties of Carnations and twelve of Sweet Peas. Mrs. Jno. Sebright, the new rose, turning to mauve with age, was well shown, and many other varieties, representing all sections of border Carnations. Mrs. W. V. Carrington, a lovely flesh white, is a fine flower, and worthy of inclusion in any collection however small.

Mrs. M. V. Charrington, Edenbridge, staged a number of vases of border Carnations, many being only recent introductions. The Gift, a yellow ground variety with crimson markings; Edward Charrington, Coronation, and several seedlings as yet unnamed were very interesting items on the table.

H. Balderson, Esq., Corner Hall, Hemel Hempstead, sent Carnations, Gladys Taylor, a flesh pink with little scent, but fine form, and C. Mary Francis, a yellow ground variety with crimson margin.

Messrs. Jas. Douglas, Edenside, Gt. Bookham, staged border Carnations in variety, the most worthy of notice being *Palatin*, Bookham, White Clove, Mrs. Prinsips, Czarina, Countess of Verulam, and Monarch.

Dr. Bonavia, Westwood, Richmond Road, Worthing, sent buff coloured *Oleanders*, which originally came from Hyères in the South of France, and is very floriferous and of delightful odour. The specimens exhibited were cut from plants in the border of a greenhouse, and were very lovely.

Messrs. Van Meerbeek and Co., Helligom, near Haarlem, sent three seedlings of *Calla Elliotiana*.

Messrs. Wm. Bull and Sons, Chelsea, sent *Imantophyllum cyrtantho-mineatum*, very pale orange in colour. Amongst those worthy of special note were the well-known *Prince of Wales*, C. Davis, C. Read, making fine specimens of the large leaved section, and C. Thomsoni.

#### Orchid Committee.

Present: Messrs. Harry J. Veitch, James O'Brien, J. G. Fowler, de B. Crawshay, H. M. Pollett, E. D. Hill, H. T. Pitt, F. W. Ashton, G. F. Moore, J. M. O'Dell, W. H. Young, J. Charlesworth, H. A. Tracy, H. Little, Jeremiah Colman, Jas. Douglas.

Cultural Commendation to Capt. Holford, C.I.E., Tetbury, for *Vanda ærulea*. First Class Certificate to L.-C. Adolphus superba, *L. einnabarina* x C. Acklandæ (Messrs. Charlesworth and Co., Bradford), a fine flower, the segments of which are rich orange mottled with chocolate, the labellum being pale yellow, with a lip beautifully orange red with a velvety appearance. Silver Flora Medal for group of Orchids to Capt. Holford, C.I.E., Tetbury. Silver Flora for group of Orchids to Messrs. Hugh Low and Co., Enfield.

Captain J. L. Holford, C.I.E., Tetbury, contributed a group of *Lælio-Cattleyas*, *Vanda ærulea*, and *Cypripediums* in variety. L.-C. elegans was splendidly shown, and *Epidendrum fragrans* was well flowered. *Cyperus alternifolius*, *Adiantum cuneatum*, and *Asparagus Sprengeri* with *Coeos Weddelliana* were used to effect in a small but pleasing group.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, staged a fine collection of *Cattleyas gigas*, C. Gaskelliana, C. Harrisoni, &c. *Cypripedium niveum* and *Cynoches chlorochilon* were also well shown. A group rich in colour and pleasingly staged.

Messrs. Charlesworth and Co., Heaton, Bradford, staged *Cypripediums* in variety. *Lælio-Cattleya purpurata*, Schilleriana, *Cattleya Germania superba* also being very fine.

From H. Little, Esq., The Barons, E. Twickenham (gardener, Mr. A. Howard), came a fine inflorescence of *Cattleya gigas*, Little's variety, bearing three grand blooms.

### Sandringham (Norfolk), July 23rd.

There is not a more popular event in the Eastern Counties than the Sandringham Horticultural Show. During the morning the roads leading to Sandringham Park, wherein the show was held, were thronged with holiday-making crowds, and every train that came into the station was heavily loaded.

When Prince of Wales, the King and his beloved consort attended the show in person, but although absent in body this year his spirit was undoubtedly in his old home, and one had only to take up a schedule to see the generous way in which Their Majesties had assisted the show, as on every page one found the words "Prizes given by Their Majesties the King and Queen."

Every class was well filled, and in many cases the produce was of such uniform merit that the judges found their task very difficult. The hon. sec., Mr. G. W. Gayford, Wolferton, is to be congratulated on the way in which he carried out his arduous duties. In addition to the many competitive exhibits there were many honorary displays; the two chief exhibits were from Messrs. Daniels Bros., Norwich; and from "Hobbies," Ltd., (John Green), Dereham. The former staged a collection of herbaceous cut bloom, several new varieties of vegetables, especially Peas, and a good sample of the luxurious Loganberry. From Hobbies, Ltd., came a large exhibit of Sweet Peas, Roses, and new Dahlias, covering 40ft of staging. Some fine examples of the much discussed new Sweet Pea, White Wings, were staged, and a remarkable pyramid of the new Everlasting Pea, *Lathyrus latifolius grandiflorus albus*. One of the trusses had no less than forty-one fully developed blooms on it, but there was a suspicion of fasciation in it; however, the average was twenty.—P. E.

### Prescot, July 31st.

The inhabitants of Prescot have good reason to thank Lord Derby for placing a portion of the beautiful Knowsley Park at the disposal of the committee, as no more ideal place could be found in which to hold a show, there being an abundance of promenade space, with splendid foliage effects. The special attraction was for a group of plants arranged for effect, a valuable silver bowl being presented by the Hon. Arthur Stanley, M.P. Three entered, with the result that the prize went to Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby, with a most tasteful arrangement, in which quality played a great part. Mr. H. Ogden, West Derby, put up a very effective second; and Mr. J. George, gardener to T. Hensham, Esq., Whitefield House, a good third.

Stove and greenhouse plants were fairly well shown, the lead being taken by Mr. Geo. Osborne, gardener to Dr. Cook, The Brook, who had a fine *Bougainvillea Sanderiana* and *Ixora Pilgrimi* as his best stove and greenhouse plants. *Caladiums* were very fine from Mr. T. Eaton, gardener to Jno. Parrington, Esq., Roby Mount. Nothing could have exceeded the beauty of the *Begonias* and *Gloxinias* which were put up by Mr. Bagnall, gardener to C. F. Boston, Esq., Charlwood House, Huyton. For four greenhouse plants in flower, Mr. Osborne left all comers, staging a splendid *Bouvardia* and *Fuchsia*. Cockscombs and Sweet Peas left nothing to be desired, Mr. P. Greene, gardener to Col. J. Gee, Allerton, winning. A capital *Croton* was the best foliage plant, Mr. Osborne winning with *Hispida Sanderiana* as the best flowering plant. The *Coleus* from Mr. George were finely grown, but wanting in colour. A beautiful specimen *Nepenthes* was the best rare and curious plant, and reflected great credit on the exhibitor, Mr. Osborne. Cut flowers were of the highest quality, Mr. P. Greene, gardener to Col. Gee, Allerton, winning in herbaceous, although the second, from Mr. George, was really admirable.

Fruit classes were superb in every respect, Mr. J. Eaton taking the lead for four dishes with capital Black Hamburgh Grapes and Elruge Nectarines. Mr. B. Ashton, gardener to the Earl of Lathom, Lathom House, Ormskirk, was a close second; and Mr. Oldham, gardener to Joseph Beecham, Esq., Ewanville, Huyton, a close third. Mr. Oldham secured the black and white Grape classes with Black Hamburgh and Muscat of Alexandria. Buckland Sweetwater was the excellent exhibit of Mr. Ashcroft, gardener to P. Walker, Esq., West Derby; extra quality Madresfield Court—for any other black—coming from Mr. Wilson, gardener to H. Cunningham, Esq., Gorsey Cop, Gateacre. Mr. Eaton and Mr. Ashton simply led the classes for indoor and outdoor fruit.

The vegetable classes were a veritable triumph for Mr. Ashton, who in the collection of twelve defeated the great local champion, Mr. J. Rainford, and won for French Beans, Vegetable Marrows, Cauliflowers, Potatoes, Carrots, Tomatoes, and Onions.

There was a great display by the trade, Messrs. Dicksons, Ltd., Chester, a fine selection of cut flowers; H. Middlehurst, Sweet Peas; Alex. Dickson and Sons, Ltd., Newtonards, a superb collection of Roses, old and new, amongst the latter being Lady

Derby, a Rose of fine form to be noted again; Caldwell and Sons, Knutsford, brought Roses and herbaceous flowers in variety, and last but not least the handsome stand of Carnations from Mr. C. A. Young, Floral Nursery, West Derby.

The day was fine, attendance large, and the courtesy of secretary, Mr. W. Case, and his assiduous committee unbounded.—R. P. R.

### West Derby, August 4th.

There could be no mistaking the increased interest which is being taken in horticulture generally, the West Derby Show giving ample proof each year by the larger entries and an altogether higher tone in every direction, the Rector, the Rev. Percy Stewart, recognising the fact by kindly placing the large and commodious field adjoining the Vicarage at the disposal of the committee. The groups of plants denoted a very special improvement, and with the exception of a somewhat unfinished edging pervading them, the three arranged were of very excellent merit. Mr. George Osborne, gardener to Dr. Cook, The Brook, gained the lead with a smart circular group in which the mound principle did not intrude upon the beauty of other valuable plants interspersed. A capital second came from Mr. J. Knowles, gardener to Mrs. Heywood Bright, but it was lacking the bright colour of the former. Mr. H. Ogden, West Derby, was third. Stove and greenhouse plants were small but in good condition, Mr. G. Osborne having for his four *Gloriosa superba* (fine), *Crotons Reidi* and *Carrieri*; also for *Ixora Williamsi*, *Croton Heathi elegans*, as the best flowering and foliage single specimens.

A magnificent double *Begonia* was staged by Mr. J. Knowles. *Liliums* were very moderate, Mr. George Osborne winning also with Palms and table plants. Herbaceous cut flowers received primitive treatment in the matter of staging, and the committee would do well to see that they are named for the future. This for the benefit of visitors. Mr. Ogden here asserted his clever superiority. Mr. J. Ashcroft, gardener to W. Leeming, Esq., had fine flowered Sweet Peas, and Mr. Ogden the best bouquet. A spray consisting of *Bouvardias* and *Roses* came from Mrs. Calvert. Baskets had no redeeming feature to recommend them.

Fruit was small in entries, Mr. Gaunt winning with excellent Muscat of Alexandria, Mr. Ashcroft with Buckland Sweetwater and large Black Hamburgs. Dahlias and Roses were not up to the usual merit, owing to the precarious season. Vegetables were excellent, Mr. G. Osborne coming to the front for twelve Globe Artichokes, Leeks, Onions, Carrots, and Cauliflowers being extra, but again no name. A champion collection came from Mr. Ashcroft, but this was disqualified for containing thirteen varieties. A certificate of merit was awarded to Mr. Davenport, gardener to R. Le Doux, Esq., for a handsome collection of Orchids, including *Laelia Iona*, *Oncidium Kramerianum*, and some fine forms of *Odontoglossum crispum*. Mr. C. A. Young, Floral Nursery, West Derby, had a superb table of plants, a background consisting of pyramids and Sweet Peas alternating with *Hydrangea paniculata grandiflora*, second row of Sweet Peas in vases, and a stand of cut blooms of all the choicest Tree Carnations. New seedlings from Mr. Young's celebrated Northern collection were: Miss Maud Young and Miss Molly Cleaver, fancy yellow grounds; Lord Kitchenier, a splendid scarlet self; and Miss Lily Babcock, a snow white. A certificate was never more worthily granted. Mr. C. A. Young makes an ubiquitous chairman, Mr. Rose an admirable secretary, and Mr. John Young a most courteous assistant.—R. P. R.

### Basingstoke, August 4th.

The summer exhibition was held in Goldings Park, and was in every way a success. The classes were well filled, while the quality of the exhibits left little to be desired. Plants were, perhaps, the weakest feature. In this section there were fewer exhibitors. The leading class was that for a group of miscellaneous plants arranged for effect in the shape of the letter D. Mr. Best, gardener to F. R. Leyland, Esq., The Vine, Basingstoke, just succeeded in winning premier place by the quality of the plants employed, and by a slightly better disposal of them. Palms, *Crotons*, Orchids, and Ferns showed to effect here. In the second prize group from Mr. C. Harvey, gardener to W. W. Perral, Esq., Southington, Basingstoke, the Palms were especially healthy and lightly arranged, but the general arrangement was a trifle flat. In the class for nine specimens, Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sheffield Manor, Basingstoke, was an easy first with fairly good examples of *Ixora Thompsoni*, *Bougainvillea Sanderiana*, *Kentia Belmoreana*, *Cocos Weddelliana*, and a handsome mass of *Lilium lancifolium album*. With a grandly flowered example of *Acalypha Sanderiana* Mr. W. Hunt, gardener to J. Moss, Esq., Fern Hill, Blackwater, won the premier award for specimen plant in flower. Mr. Best staged grandly coloured pyramidal trained *Coleus*. Mr. Hunt had the best *Geraniums* and *Gloxinias*—well flowered examples. Tuberous *Begonias* were excellent. For nine, Mr. W. Green, gardener to S. E. Bates, Esq., Marydown Park, Basingstoke, easily secured the leading position. Mr. C. Kew, The Common, Basingstoke, staged freely flowered if not large *Fuchsias*.

Cut flowers were a distinct feature of the show, so numerous were they. The prizes for Roses were keenly contested. Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, won for twenty-four and for twelve distinct, staging medium-sized fresh examples. Mrs. E. Mawley, La France, François Michelin, and A. Colomb were noteworthy. Mr. Wasley followed with a creditable set. Mr. Neville also secured the leading position for twelve Carnations, with neat examples of the popular varieties, including a handsome self pink coloured seedling, Mrs. Flight.

Hardy cut flowers are always a feature at this show. Messrs. B. Ladhams, Limited, offer prizes for the best collection arranged in a space of 6ft run of tabling, which brought a keen competition and good produce. Mr. W. Hunt easily won the premier award with huge bunches of Gaillardias, Pentstemon Newbury Gem, Chelone barbatum, Stenactis speciosus, and Coreopsis Eldorado, quite the best of this family. Mr. Tamplin, gardener to W. R. Mitchell, Esq., Down Grange, Basingstoke, was a capital second. For twelve bunches hardy herbaceous Mr. Hunt again secured the leading award with a grand exhibit of similar produce, also including Achillea The Pearl, Monarda didyma, Eryngium amethystinum, and Aconitum napellus. Mr. Wasley a good second. Sweet Peas were a distinct feature, no less than eleven competitors taking part in the class, provided with a grand lot of blooms of popular varieties. Mr. S. Clifton, Winchester, was the leading prizetaker. Mr. Tamplin second.

A separate tent and special classes were set apart for ladies, which proved a great success, as it always does at this show. For the best decorated table suitable for six persons there were four competitors, and as all possessed much merit, the display was a good one. Miss Wadmore, Brook House, Basingstoke, won the coveted award with an arrangement that left little to be desired; it was bright in colour, harmonious, and lightly disposed. With an arrangement of pink coloured Ivy-leaf Geranium and grasses Miss Gosling, Basingstoke, secured the second award. For the best arranged stand of wild flowers, grasses, and berries there was keen competition. Mrs. Thorne, Winchester Street, Basingstoke, was first with a superb exhibit. Miss Kate Wadmore a close second. For a stand or vase of flowers and fruit an attractive display was made. Here again Miss Wadmore once more displayed her fine taste by securing the leading award for an arrangement that left little to be desired. Mrs. Thorne second. Miss Nellie Wadmore won first prize for a pair of stands or vases with a choice mixture of flowers, &c. The best floral basket, arranged for effect, was one from Miss Wadmore that displayed every flower it contained to perfection.

Fruit was, as it usually is here, most meritorious. For a collection of six dishes, Pines excluded, Mr. Hunt just secured the leading award with well finished Black Hamburg, good Cardinal Nectarines, fair Peaches, and excellent Figs. Mr. Bowerman, gardener to Lord Bolton, Haekwood Park, Basingstoke, second. For two bunches Black Hamburg Grapes there was brisk competition, Mr. Tamplin winning with examples of good shape, yet wanting a trifle more in colour; Mr. Bowerman following. For two bunches any other black variety, Mr. Wasley secured the coveted position with Madresfield Court, fine in berry and finish. Mr. Hunt followed with Muscat Hamburg, Mr. Bowerman staging Appley Towers in good condition for third prize. For two bunches of Muscat, Mr. Hunt depended upon Muscat Hamburg, while Mr. Wasley had Muscat of Alexandria, securing the prizes in the order here given.

Vegetables were exceedingly fine in quality and numerous. For the prizes offered by Messrs. Sutton there was keen competition. Mr. Kneller, gardener to Sir W. Portal, Malshanger Park, won for six varieties with exceedingly fine Ailsa Craig Onions, Snowdrop Potato, Perfection Tomato, Autumn Mammoth Cauliflower and Perfection Peas. Mr. Bowerman a good second. Mr. Best won the leading position in the class in which Messrs. Webb provided the prizes, Mr. Bowerman taking a similar place for the society's prize for eight kinds.

Non-competitive exhibits were numerous, Messrs. B. Ladhams and Son, Shirley, Southampton, had a charming collection of herbaceous flowers, in which Coreopsis Eldorado, Rudbeckia lutea conspicua, Gaillardia Bownham's Queen, Rubus noctkatis, Lilium chalcodonium, and Eryngium alpinum were conspicuous objects. Messrs. Wadmore, plants, flowers, and vegetables, making an attractive exhibit. Mr. W. Breadmore, Winchester, had a remarkably fine exhibit of Sweet Peas, which were much admired.

### Abbey Park, August 5th and 6th.

With the accompaniment of flower show weather this great event of August Bank Holiday was held as usual in the Abbey Park. Several large tents were filled with exhibits of a high order of merit, and in addition, the Park itself, which under the care of Mr. John Burn is admirably kept and exceedingly gay, was full of attractions, chief among them a number of tubs of Sweet Peas, the tubs about 2ft or so in diameter, one variety only in a tub. The plants had made a vigorous growth, and were carry-

ing splendid heads of bloom. They were the admiration of everyone who saw them.

One tent was occupied by a line of splendid groups from six competitors, all following the method of arrangement made familiar to us by Mr. James Cypher, who hitherto, we believe, unbeaten in this particular line this season, had to submit to defeat in the person of Mr. Thompson, gardener to G. H. Turner, Esq., Littleover, Derby, which group was rich and not too crowded. Mr. W. Vause, Leamington, was third, and three other prizes were awarded. With six stove and greenhouse plants, Mr. Blakeway, gardener to P. H. Muntz, Esq., Rugby, was first; Mr. W. Vause, second; and Mr. W. Finch, third. Exotic Ferns were shown in sixes, and the best specimen plant was Allamanda Hendersoni from Mr. H. Blakeway.

In the cut flower tent Roses were a leading feature, and there was a very good display. The best thirty-six varieties came from Messrs. A. Dickson and Sons, Newtonards, Belfast, who had some finely developed blooms. Chief among them Etienne Levet, Mildred Grant, Her Majesty, Horace Vernet, Mrs. J. Laing, Souvenir de Charles Grahame, a rich-coloured Hybrid Tea, &c. Messrs. Harkness and Co., Hitchin, were second with a very good lot of flowers for the season, chief among them Mrs. J. Laing, Bessie Brown (which was selected as the best bloom in the show), Duchess of Portland, Mrs. Sandford (a blush sport from Mrs. Laing), Horace Vernet, Comtesse de Ludre, &c. Messrs. Harkness and Son, Bedale, were third. Messrs. Dickson and Sons were also first with twenty-four varieties, having in fine character Her Majesty, Ulrich Brunner, Mildred Grant, Florence Pemberton (a large full pale Rose), Mrs. Donald McKee, Etienne Levet, &c. Messrs. Harkness and Co. were second; and Messrs. D. and W. Croll, Dundee, third. With twelve Teas and Noisette, Messrs. Dickson and Sons were again first. They had fine clean blooms of Madame Jules Gravereaux, Mrs. E. Mawley, White Maman Cochet, Comtesse de Nadaillac, &c. Messrs. D. and W. Croll were second; and Messrs. Harkness and Co. third. The best twelve Roses of any one variety were Mrs. W. J. Grant from Messrs. D. and W. Croll. Messrs. A. Dickson and Son were second; and Mr. J. Barrow, Leicester, third, each with Bessie Brown.

Carnations, white ground flakes and bizarres, also white ground Picotees, selfs, yellow grounds, and Fancies were all in good character. Messrs. Thomson and Co., nurserymen, Birmingham, taking some of the leading prizes. There were several classes for single blooms, both of Carnations and Picotees.

There were stove and greenhouse cut flowers in twelve bunches, the same number of hardy annuals, Zonal Pelargoniums, Fancy Pansies, and Violas were also well represented. Some fine collections of hardy herbaceous and bulbous flowers were staged, and there were classes for floral decorations, such as bouquets and baskets of flowers, sprays, buttonholes, &c. The crowd was so great in the tents that it was physically impossible to gather in full particulars. Roses were shown in several classes by gardeners and amateurs, the principal prizewinners in the large classes were the Rev. J. H. Pemberton, M. Whittle, and R. T. Hobbs. There were also classes for Carnations, Picotees, Pansies, &c., in all of which there was good competition.

There was less fruit than is usual at Leicester; but some very fine produce was staged, especially by Mr. J. H. Goodacre, Elvaston Castle Gardens. At the judges' luncheon, Mr. Owen Thomas spoke in the warmest words of approval of the fine quality of the Grapes—Muscat Hamburg and Madresfield Court in particular—shown by Mr. Goodacre. He was first in the eight dishes, Pine included, showing a good Queen, superb Muscat Hamburg, Muscat of Alexandria, and Black Hamburg Grapes, Noblesse and Chancellor Peaches, Elrue Nectarines, and Conqueror of Europe Melon. Mr. J. Read, The Gardens, Bretby Park, was second. In another class for eight dishes, Pine excluded, Mr. Goodacre was again first with Black Hamburg and Muscat of Alexandria Grapes, Royal George Peaches, Pineapple Nectarine, Kirke's Plum, fine Negro Largo Figs, a splendid dish of Clapp's Favourite Pear and Melon. Mr. J. Read was again second. Mr. Goodacre came in an easy first with a collection of four varieties of Grapes, he had Black Hamburg, Muscat of Alexandria, Mr. Pearson, and Madresfield Court. Mr. Goodacre also had the best two bunches of Black Hamburg; Mr. J. Thompson being second. He was also first with two bunches of Muscat of Alexandria; Mr. W. Duncan, Kegworth, being second with two bunches of any other black. Mr. Goodacre was first with superb examples of Muscat Hamburg. Mr. W. Duncan was first with two finely developed bunches of Buckland Sweetwater; Mr. Read was second with the same. Peaches and Nectarines in single dishes were sparingly represented, the best were Grosse Mignonne and Chancellor, the best Nectarines Lord Napier and Elrue. Plums were few, but very good, Kirke's, Jefferson, and Transparent Gage. There were no Pears, and but one dish of presentable Apples. In the Cherry class the Black Tartarian was very fine, and there were very good bush fruits, Gooseberries, with Red, White, and Black Currants; also very fine Tomatoes.

Vegetables in the open and gardeners' classes were very fine, the special prizes offered by Messrs. Sutton and Sons, Harrison and Sons, Yarde and Co., and others, brought very fine collections. Of all the vegetables, we were most pleased with those shown by cottagers living within a radius of four miles of the market place. They were not only numerous, but of very fine quality. So were their bouquets and baskets of garden and wild flowers, their Stocks and their striped and self Antirrhinums.

Many miscellaneous subjects were staged, and Gold Medals were awarded to Mr. W. Bentley, Leicester, for cut flowers; Amos Perry, South Tottenham, for hardy flowers and Water Lilies; Harrison and Sons, Leicester, for Capsicums and other plants and Sweet Peas; Gilbert and Son, Bourne, Lincs., for 100 bunches of Sweet Peas; Blackmore and Langdon, Bath, for a collection of single and double Begonias of exceptionally fine quality, and nearly a dozen Silver Medals were also awarded.

### Reading and District Mutual Improvement.

The annual outing of the above association was held recently, and notwithstanding the dull weather, a very enjoyable time was experienced. The members, who came from various parts of the district, including Mr. Leonard Sutton (president), Messrs. Townsend (Sandhurst Lodge), Rudd (hon. sec. of the Theale Gardeners' Association), Stroud (Burghfield), Green, Roberts (Woodly), Loader, Pontin, Davidson (Wokingham), Watts, Prior (Crowthorne), Barefoot (Mortimer), Martin (Sonning), Cox (Calcot), Ritchings (Wellington College), Herridge (Caversham), Wright, Lailey (Bucklebury), Lever (vice-chairman), Cox (hon. sec.), Fry, Macdonald, Judd, Lees, Soutter, Pembroke, Hinton, &c., met at Caversham Lock and travelled by the Mystery to Fenley, when by the kind permission of Mrs. Noble the beautiful gardens and grounds of Park Place were visited, the day being spent there. On arrival the party was received by Mr. G. Stanton, the head gardener (chairman of the association for 1902) and was joined here by Messrs. Gibson (Danesfield, Marlow), Hatton (Mill Hill), Powell (Park Place), Pigg, Priestly (Maidenhead) Hatton (Badgemore), &c. Proceeding through the dark arches an inspection was made of the outdoor gardens, where Roses and Sweet Peas were blooming profusely. Amongst the latter, of which 160 varieties are grown here, Countess of Lathom, Saidie Burpee, Emily Eekford, Black Knight, Brilliant, Her Majesty, New Countess, Salopian, Golden Gleam, Miss Willmott, Triumph, and Gorgeous were of exceptional merit, the flowers being large and of exquisite colours. Luncheon was then partaken of, and full justice having been done to the good things provided, the president, on behalf of the members, tendered their thanks to Mrs. Noble for her kindness in throwing open her charming grounds to them. Afterwards the company broke up into several parties, some going to the cricket ground to show their prowess with bat and ball, and others rambled through the vineries, stove, and greenhouses, not forgetting to inspect the collection of beautiful birds adjoining the residence. After tea the party wended their way to the boat, and reached Reading about nine o'clock, each one having thoroughly enjoyed the outing arranged for 1902.

### Shirley (Southampton) Gardeners'.

At a meeting of the above society, held recently at the Parish Room, Mr. J. Jones presided, and an excellent lecture was given by Mr. J. W. Mitchell, of The Gardens, Chilworth Manor, on "The Cultivation of Stone Fruit," a subject upon which he is able to speak with practical knowledge. He first spoke of the progress which the Peach and Nectarine had made in late years under glass cultivation. In choosing young trees to start with, avoid strong ones, because it is very rare you get any fruit on such. He preferred trees two or three years old, and which had been shifted twice. He favoured a border about 2ft in depth, with good drainage, and in width from 5ft to 8ft, according to the height of the wall. Do not use any manure in planting, but feed them afterwards. Disbudding is a most important operation, and it can only be learnt by practice. Mr. Mitchell also dealt with Plums and Cherries, strongly recommending the Victoria Plum for the cottager. A good discussion succeeded, in which Messrs. Jones, Wilcox, Miles, Verdon, and other members took part. Mr. Jones raised the question of the Waterloo Peach dropping its buds. It was suggested by Mr. Verdon that this might arise from the stock upon which it was grafted. The secretary (Mr. J. Miles) said that Waterloo was a favourite with himself, and that he gathered his first dish of ripe fruit on the 16th of July from a tree that had not had any protection whatsoever. There being some signs of incredulity as to this being the variety named, Mr. Miles said he bought it as such. He also said that he sent in his first dish of ripe Pears that morning. Mr. Mitchell said such forward growth was no doubt due to good cultivation and thorough shelter, obtained by high garden walls. A First Class Certificate of Merit was awarded to Mr. E. J. Wilcox for eighteen bunches of Sweet Peas, twelve spikes each. Mr. B. Ladhams had cut flowers; Mr. F. Snelgrove

had Hainburgh Grapes; and a vote of thanks was awarded to the hon. secretary (Mr. J. Miles, 222, Portwood Road) for a wasp nest with the live wasps taken off a bee hive, and how he removed it without being stung was a wonder to many. It formed one of the most interesting exhibits shown for a very long time.—J. M.

### Scottish Horticultural, August 5th.

The monthly meeting of this association was held in the society's rooms, 5, St. Andrew's Square, on the evening of the 5th inst., Mr. Comfort (president) in the chair. Ten new members were proposed for election. The paper of the evening was entitled, "A Supply of Vegetables All the Year Round," by Mr. Charles Blair, gardener, Preston, Linlithgow. In a very lucid and instructive paper of half an hour's length Mr. Blair, in a chronological manner, detailed his practice from January till December: when to sow, what to sow, and the best sort to sow. In dealing with Peas, Mr. Blair referred to the recent controversy between science and practice as to whether manure was efficacious or not, but gave it as his experience that heavily manured land produced a much larger crop, of better quality, than when grown on unmanured land. Referring to maggot in Onions, Mr. Blair recommended a mulching of short grass as a certain remedy. He strongly advised that Potatoes should not be manured if fine quality was wanted, but to sow on land which had grown Peas the previous season. Mr. Blair's paper was interesting all through, and was full of valuable hints to gardeners and amateurs. A most interesting discussion followed, and many valuable hints were given by the various speakers. Mr. Whyttock, Mr. Scarlett, Inveresk, Mr. Macintosh, Mr. Smale, and others took part in the discussion. Mr. McHattie, of the City Gardens, brought the discussion to a close by proposing a vote of thanks to Mr. Blair, which was heartily accorded.

The exhibits at the meeting were numerous and varied, and the table presented a most attractive appearance. The most attractive exhibit was six vases of Roses, from Mr. M. Todd, Musselburgh, of superb quality, and cut with long stems to show their habit. Nine blooms of Caroline Testout were superb. Others were Baroness Rothschild, Ulrich Brunner, Captain Hayward, Gustave Regis, Général Jacqueminot, Marie Baumann, &c. A cultural certificate was awarded. Messrs. Grieve and Sons, Red Braes Nurseries, staged a most attractive exhibit of Fancy Pansies and Violas, a new light yellow Viola, Canary, receiving a certificate of merit. Also a very rich crimson Dianthus named Coccinea. Mr. Comfort exhibited a very large truss of Hydrangea. A beautiful bloom of Eucalyptus filicifolia was shown by Mr. McMillan, Trinity Grove. The exhibitors were thanked for their productions.

It was agreed to hold next month's meeting on September 9, instead of the 2nd, being the evening before the autumn show in the Waverley Market. A vote of thanks was unanimously awarded to Mr. Wardrop, of Garvald, for his kindness in allowing a visit to his beautiful gardens and grounds on the occasion of their annual excursion. A vote of thanks to the chairman brought a most enjoyable meeting to a close.

### Young Gardeners' Domain.

#### *Kalanchoe flammea.*

This splendid new flowering plant, introduced from Somali-land in East Africa, deserves a place in every greenhouse. The brilliant colour of its inflorescences, and their durability, combined with a good habit in the plant itself, and its comparative ease of cultivation, ought to make it a great favourite. It grows about 18in high, is very useful for decorative purposes, and when better known will probably be largely grown. As the seed is very small, it must be sown lightly in pots or pans filled with sandy soil. Cover the pans with glass, and place them in a warm greenhouse. When the seedlings can be handled prick them out in boxes filled with sandy loam and return to the warm house. Pot the plants into "60's" (3in) as they require it, using the same soil, and encourage them to grow steadily. Before becoming root-bound, shift them into "48's" (5in), giving two parts loam, with one part of sand and mortar rubble mixed. Handsome plants may be grown in this size of pot if fed with a little fertiliser and well exposed to light. Each one should also have sufficient room to develop. Shade from the sun when the blooms open, and the flowers will last longer, and be of better colour than they otherwise would. I have not observed any insects upon this *Kalanchoe*, and probably they will not give much trouble in this respect.—M. FENN, Journeyman.

[The winter treatment of the plants in regard to watering them requires much care, as we find they sometimes damp or become rusty. *K. flammea* has been used as a bedding plant at Kew.]

# THE BEE-KEEPER.

## Purchasing and Moving Bees.

The best time to purchase bees is the spring or autumn. The advantages of a spring purchase are that there is no risk of loss during the winter, and in most cases by the end of the season they have repaid the initial outlay; in the autumn bees are, of course, less expensive. It is not advisable to buy stocks which are not in modern frame hives, as they are to a certain extent unmanageable, while transferring involves considerable trouble in addition to the risk of incurring disease. If swarms are desired, be careful to obtain them from an apiary free from disease, and from hives which swarmed the previous year, the queens will then be in their prime. Second swarms are generally weak, and consequently unprofitable. It is more satisfactory to purchase swarms by weight. There are between four and five thousand bees in a pound, and a good swarm consists of five pounds or seven quarts. Newly hived swarms should be removed in the evening of the same day that they issue, as they mark the location, and a subsequent removal means the loss of many bees. If the swarm is in a skep or box cover with open cloth and carry mouth downwards. It is now generally admitted that if purchased early enough, better results can be obtained from a nucleus which costs about the same as a swarm.

Stocks in bar-frame hives should be well packed before removal, which may take place when the temperature will not interfere with the stability of the combs. There is always an element of risk and some difficulty in packing stocks securely for a journey, but with care they should travel safely any distance. Jarring disturbs the bees, causing them to generate a high temperature, which increases the liability of a breakdown. April or September are by far the best and safest months. After the weather has prevented long flights they may be moved at any time when the distance is above half a mile. The effect of the excitement caused by moving in April is a beneficial stimulant. When disturbed earlier, the unnatural temperature caused is injurious.

Bees when excited fill themselves with honey, this occurs under confinement; when liberated they fly, and after many erratic movements, if the temperature is low, fall to the ground chilled and die. The results of such losses in the early part of the year cannot be estimated, as the brood in its different stages is entirely dependent upon the warmth being maintained. A week or two later makes all the difference, as the hatching of the young bees reduces this risk to a minimum.

The inexpert should remember that in all methods of transit the ends of the combs should face the direction in which they are going, so that if the combs are fitted with metal ends it is impossible for them to bump against each other and crush the bees between them. Before removing bar-frame hives it is necessary to place a piece of open sacking or cheese-cloth over the frames in lieu of the quilt, for ventilation, then fasten with screws a strip of wood 2in wide along the whole of the bar ends on each side of the body box. This, if properly done, will make the bars perfectly rigid. All the hive parts must then be fastened so that they cannot move. Nails are objectionable for the purpose, as they necessitate the use of a hammer to drive the nails, irritating the bees and probably breaking the combs. Old wired combs travel better than new ones. The closing of the entrance with a strip of perforated zinc completes the work of packing. Whether it is intended to travel by rail or road it is advisable to pad the bottom of the hive legs with straw to lessen the vibration. On arrival at destination, place them in the desired position and allow them to settle before releasing them. A day or two afterwards a careful examination should be made to ascertain whether the combs or queens have sustained any injury.

The precision and accuracy with which bees will find the exact position of their hive is remarkable. They follow their track unerringly guided by sensations of an unknown nature, among which sight plays a great part. In finding their way they are first guided by objects such as high chimneys and clumps of trees, until the accustomed surroundings are recognised, when they alight without hesitation on their stand. If the whole apiary was removed about 2ft or 3ft further away, and the relative positions retained, it would not inconvenience them. Therefore if we are not satisfied with the stand of one of the colonies and desire to move it a distance of less than half a mile, it should be allowed to remain until the bees are dormant before removal. After confinement during a cold spell they re-mark their position and naturally return to the new location. The position of a hive can only be altered in the summer months by moving it about 2ft each day, not counting those on which the bees do not fly, or removing them to the selected spot in the morning or evening when the bees are quiet, and placing a piece of board or some

unusual obstruction in front of the entrance so as to interfere with their flight; this to them being an inexplicable object is at once noticed and the position marked, thus enabling them to find their way back without difficulty.—E. E., Sandbach.

## Hardy Fruit Garden.

**FEEDING OUTDOOR PEACHES AND NECTARINES.**—It is only when carrying a crop that Peaches, Nectarines, and stone fruits generally, should, as a rule, receive any extra stimulating food, except, perhaps, when growth is of a somewhat weakly character, and would be improved by additional help. When bearing fruit, the demands of the trees for food and moisture are heavy, and if not properly supplied, undersized fruit and impaired quality are the result. Excess of food without fruit results in strong and sappy growth, which is never productive, owing to failure to ripen it sufficiently. A good manure for Peaches and Nectarines, as well as Vines, is Thomson's Vine and plant manure. To healthy trees with abundant roots spreading in moist soil, scatter the manure on the surface, 2oz to the square yard, and water it in, giving this at intervals of a week until the fruits begin to colour. As a change, watering with liquid manure, toned down to a safe strength, may be applied. When the surface of the border is fully exposed to the drying influence of sun and wind, with the additional heat which brick walls absorb, assisting in abstracting moisture, help for the roots will be derived if a mulching of a light character is applied, so that rapid evaporation may be prevented.

**OUTDOOR VINES.**—The growth must be kept well in hand, not allowing large quantities of superfluous shoots to extend and then shorten them wholesale. This gives a decided check to the trees which is not desirable. Maintain a little extension of growth beyond the bunches of fruit, according to the amount of space available. When stopping is required, do it when the shoots are soft. Extension growths, to be eventually used as fruiting canes, ought not to extend too long without a stopping, not more than 4ft or 5ft, even if free growth is permitted afterwards. The stopping helps to plump up the lower buds, and with plenty of room allowed the main leaves the canes will strengthen and ripen. Assist the bunches to swell with ample moisture, consisting of water and liquid manure, and protect the roots by mulching.

**BLACKBERRIES.**—Having secured an ample crop of fruit, afford every assistance to help its development. In the first place, suppress the whole of the weakly growth that bears no fruit. The strong and long canes which are being produced may be tied in, but in such manner that they are able to receive the ripening influences of light and air. This treatment will also give the fruit more exposure. Blackberries are gross feeders, and an ample mulching of rich manure must be supplied, on to which liquid manure from the farmyard can be freely poured from time to time.—EAST KENT.

## Fruit Forcing.

**CUCUMBERS.**—Where there is but one house it is usual to make a sowing in August for raising plants to place out early in September to yield a supply of fruit by December and onward through the winter. Where there is convenience, it is preferable to rely on the autumn fruiter for a supply up to, and over, Christmas, when plants from a sowing made at the beginning of September will be in good bearing, and continue the supply from the early parts of the year and through the spring months. One of the best Cucumbers for fruiting all through the year is a true stock of the old Telegraph, though there are many varieties that also possess a fine deep green colour, have shorter necks, are heavy—a point of some consequence when Cucumbers are sold by weight, and are of good quality. Every grower has a sort of his own which is appreciated; but there is very little difference in many Cucumbers of the Telegraph and Rochford types, except for sale, when they must be good in appearance and colour, straight, heavy, and crisp. The work of clearing out the house intended for the plants, the seeds of which have been, or are about to be sown, should be pushed forward, and attend to any repairs that may be necessary, or painting of the house, otherwise thoroughly cleanse the woodwork with carbolic soap and water, lime-wash the walls, or wash them with iron sulphate solution, made by placing 6½lb of iron sulphate in an old barrel, pouring on it ½ pint of sulphuric acid, and then adding by degrees 12½ gallons of water. Clear out the old soil and disinfect the beds

with the iron sulphate solution. If fermenting materials are used for bottom heat they must be well prepared, throwing the stable litter into a heap and turning over two or three times. This effectually works destruction on any animal micro-organisms present, and also on the resting spores of parasitic fungi.

**VINES: EARLY HOUSES.**—Though the Vines have the wood ripe and the buds plumped, with the older foliage falling, there must not be any attempt at removing adhering leaves, nor to cut the laterals in all at once, as that would probably cause the principal buds to start: therefore, remove the laterals by degrees, and shorten some of the long shoots, preserving, however, some growth, especially when the principal leaves are down, above the buds to which the Vines are to be pruned, the final pruning being deferred until the early part of next month. The old surface soil, top-dressing, or mulching, should be removed, forking any soil unoccupied by fibres from amongst the roots, taking the opportunity of raising any that are deep, and laying them in fresh material nearer the surface. Good calcareous or gritty loam (not too light) is the most suitable, with about a twentieth of wood ashes and a fortieth part of crushed half-inch bones. If the soil be light and gravelly, add a sixth of clayey marl, dried and pounded small; if heavy, supply about a sixth of gritty matter—calcareous or ferruginous gravel or freestone chippings; if deficient in calcareous material, add a sixth of old mortar rubbish to heavy soil, and chalk to light soil. Charcoal “nuts” is an excellent addition in any case to the extent of one-tenth. Give a moderate watering if dry, it sufficing that the compost be evenly moist, and the roots will push fresh rootlets, especially adventitious ones, from near the collar into the new soil, and be in capital condition for a start when the time comes round. If the Vines are in an unsatisfactory condition, the border should be examined, and this being faulty, either in composition or drainage, shade the house, lift the Vines, wrap the roots in wet mats, promptly remove the old soil and drainage, supplying clean and sweet in their place, relaying the roots in the fresh material with despatch. This will give the Vines a chance to form or make provision for pushing fresh roots, and so effect a good start; otherwise, lifting or renovating the border being deferred until the leaves are all down, the start is not nearly so satisfactory.

**MIDSEASON HOUSES.**—Vines generally have done well this season, especially as regards crop; but there has been an unusual prevalence of “spot” and a fair amount of “rust,” probably mainly due to the changeableness of the weather, and attention to the ventilation would counteract the prejudicial influences of its vicissitudes. There has also been more than the usual amount of shanking. Grapes, too, have been slow in acquiring colour; while some Vines have lost some foliage through the affection known as “browning.” Red spider also has been troublesome in places, for which there is no better remedy than syringing the leaves carefully with a weak solution of softsoap on the first appearance of the attack, and thinly coating the hot-water pipes with a cream formed of skim milk and flowers of sulphur. The free use of fertilisers has also great effect on red spider infested Vines, together with copious supplies of water. A surface mulching of rich, but not close, material, is of immense advantage to Vines in light soils and restricted borders, with supplies of liquid manure of a sustaining, rather than of a stimulating, nature are essential to a satisfactory result. Fire heat will be necessary where Grapes are ripening to secure a circulation of air, prevent the deposition of moisture on the berries, so avoiding “spot.” A temperature of 60deg at night is ample for Grapes when ripening, with 70deg to 75deg by day artificially, 5deg more being allowed for Muscats and other high temperature requiring varieties, allowing advances of 10deg to 15deg from sun heat. When the Vines are carrying heavy crops, the temperature should be kept rather low at night, so as to give time and rest to Vines in order to perfect them.

**LATE HOUSES.**—After the Grapes commence ripening, full supplies of water are necessary until they are well advanced in colour, as most late varieties take a long time to perfect thoroughly. All late Grapes require time, and when commencing to colour they require a free circulation of warm, rather dry air on favourable occasions, and a little constant ventilation, and then with due supplies of food and moisture they attain a fulness of berry and a perfection of finish, other conditions being favourable. Indeed, poverty of finish is the chief cause of shrivelled Muscats and others shrinking after they have hung some time. Afford a temperature of 70deg to 75deg by day, 80deg to 90deg with sun, and close sufficiently early to increase to 90deg or 95deg. When the sun is losing power, put on enough top and bottom and side air to ensure a circulation, allow the temperature to gradually cool, which rests the Vines, and increase the ventilation early with the advancing temperature. The hot-water pipes should, if necessary, have a little warmth in them to prevent the temperature falling below 65deg at night, for parsimony in this respect is often costly, as having to apply fire heat late in the season is more expensive, and the result unsatisfactory.—**ST. ALBANS.**

\* \* All correspondence relating to editorial matters should be directed to “THE EDITOR,” 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy—Competition.

“Well-wisher” promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

### CUCUMBER LEAVES AND FRUIT DISEASED (W. D. R.).

—The specimens are infested by the comparatively recently determined Hole-and-Spot fungus, *Cercospora melonis*, which on the leaves produces numerous pale spots, the tissue shrinking and dying away, leaving holes of varied sizes. Sometimes, however, it destroys the whole leaves, and that suddenly, they appearing all right in the morning, and under an outburst of sunshine collapsing in a few hours. It also attacks the fruit, causing large spots, and decay speedily ensues. The fungus is most prevalent during spells of cold, dull, and moist weather, and is certainly favoured by the extremely close and water-saturated atmospheric conditions under which Cucumbers are grown for marketing. The only real preventive is more air, less nitrogenous feeding—in short, more rational conditions of cultivation. The plants may be sprayed with a solution of permanganate of potassium, 1oz of the crystals in 3 or 4 gals of water, and every part of the house should also be coated with the finest possible film of the solution. It will, however, discolour white paint, still, we do not know of anything more suitable for application to Cucumber foliage and fruit. The surface of the bed should also be saturated with the solution. All affected leaves and fruits should be removed and burnt. Ventilate, and the fungus will make very little out, even in dull weather securing a change of air daily, not allowing moisture to condense on the foliage for lack of air.

**LEAVES OF APPLES AND PEARS (L. B.).**—The Apple tree leaves are infested by the Apple scab fungus, *Fusicladium dendriticum*, which first attacks the young leaves and shoots, small, roundish, dark spots appearing, mostly on the upper surface. These spots soon increase in size, and run into each other, forming large, irregularly shaped blackish blotches, and when conditions are favourable for the growth of the parasite the leaves are frequently killed while quite young; always crippled. On the fruit the fungus produces the well-known scab. The preventive treatment is to spray the trees with ammoniacal carbonate of copper solution, made by mixing 1oz of carbonate of copper and 5oz of carbonate of ammonia, and dissolving it in about a quart of hot water, and when thoroughly dissolved, add 16 gals of cold water. Spray, first, just as the flower buds begin to open; second, when the petals of the flowers are falling; and third, when the fruit is the size of peas or slightly larger. If the season be rainy a fourth treatment should be given twelve days after the third. If Bordeaux mixture be used it must be in dilute form, or the foliage will be injured. Spraying now would arrest disease, but the proper course is to prevent it. The Pear leaves are infested by the Pear leaf gall mite, *Phytoptus pyri*, which gives rise to the reddish spots on the leaves, they ultimately becoming brown or black. The mites live during the winter in the scales of the buds, and the best preventive treatment is to thoroughly spray the trees while dormant with paraffin emulsion, this being made by dissolving 1 quart of softsoap in 2 quarts of boiling soft water. Remove from the fire, and while still boiling hot add one pint of paraffin oil and immediately churn the mixture with a small hand syringe. In five minutes a perfect emulsion will be obtained, and this, diluted with ten times its volume of water, is fit for use. If the trees are now sprayed with a solution of the paraffin emulsion, 8oz to 3 gals of water, adding ½oz sulphide of potassium, and well wetting the under side of the leaves, it will keep the mites in check.

**FRUITS, NUTS, AND VEGETABLES (E. C.).**—The author is Mr. A. Broadbent, Secretary of the Vegetarian Society, 19, Oxford Street, Manchester.

**MUSHROOMS (E. J. K.).**—By "make" we presume you intend grow Mushrooms. In this case you should procure manure from stables in which carriage horses are kept, collected and kept free from the litter in a covered shed open at the front, and there turning to prevent overheating and to allow of the escape of rank steam. When enough is collected to make a bed of the desired size, the manure should be made up into a bed, not less than 12 in in depth, well beaten or trodden down to render it firm, preferably rammed down hard with a brick or hand rammer. In the course of a week the bed will have heated, and when it is on the decline, or not likely to heat more highly, it should be spawned, the temperature being 90 deg. not more, at 2 in beneath the surface. Small pieces of spawn, 1 in to 2 in square, should be inserted in holes made with a trowel 4 in apart and 2 in deep, the manure so removed being used for covering it over. In about a week afterwards, or sometimes earlier, 1 in to 2 in of moist, rather heavy loam should be laid all over the surface and beaten hard with the back of a spade. The tiny Mushrooms seldom appear in less than four or five weeks from spawning, and the time during which the beds remain productive afterwards varies very considerably. When about half grown they are termed "buttons" and the full-grown "broilers." Water may be required, but it must not be given too frequently, and, indeed, watering should be avoided as much as possible, yet water must be supplied to keep the surface sufficiently moist. Any dark place is suitable for making the bed, provided it is frostproof; if not, a covering of straw must be used.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. D.).—1, *Spiraea filipendula*; 2, *Verbascum nigrum*; 3, *Deutzia crenata* fl.-pl. (Crofter).—1, *Lycopodium alpinum*; 2, *Polystichum angulare*. (F. R. N.).—1, *Lycostera formosa*; 2, *Lælia elegans*. (G. M.).—*Magnolia tripetala*. (T. S.).—*Habenaria bifolia*.

## Book Notices.

### Garden and Grounds: How to Lay out and Arrange.<sup>1</sup>

The author of this book, which comes to us in green paper covers, is Mr. T. W. Sanders, whose name is now familiar to most gardeners. The treatise admirably fulfils the title, and beyond the concise and clear instruction imparted, there are very helpful plans, suitable for designing gardens and grounds of a quarter of an acre up to so many as ten acres. The work of laying out is described, and selections of shrubs, plants, &c., are furnished. (36 pp., 6½ by 7. Price 7d. net.)

## Young Judges and Their Training.

Of course it is very self-evident why judges and their labours are much in our mind just at present. We have shows on every side, and are deluged with schedules and prize lists. Every little community thinks it must have an exhibition of some sort and of something; they get the entries and they choose the judges. Well, there is a little difficulty here sometimes. It will not do to have a local man; it will not do to have, or rather to ask, too great a man, for indeed the best men are always spoken for months beforehand. The secretaries of shows could give lists of those men capable and willing to act. It does not do to have a man too young, the public doubt his judgment; nor does it do to have a man too old, he gets out of the fashion, and is often full of prejudice. The supply has to be kept up, and the rising men need to be educated to the profession as it were. Shall we say a thorough knowledge of stock comes first, and we shall not make a mistake if we put a good temper second, a clear head that will arrive at a decision quickly and not be turned from the point by adverse criticism. There are many good men very short metttled, and apt to be a little dictatorial with their colleagues. They are very trying, hence the need for good temper. "A soft answer"—we know the rest. There is also another saying about "Second thoughts being best"; we are not quite sure that this applies to judging. With ourselves, first impressions are oftenest the most correct. We come into the ring unprejudiced, or at least we try to do so, and unless we find on closer examination there is some unsoundness, or in horses want of manners, we generally go back to our first love.

Of course, in judging a hunter or hack class, it is impossible to really assess a horse's good qualities until we have had our leg across him. If he only goes well with his accustomed rider it is not enough; we wish to see how he will acquit himself with a stranger—that is the test. The object of his being at the show is his possible sale in the near future, and his value depends materially on his manners and good carriage, that is, of course, after his form and shape are considered to be right. There are a few judges who have the power of carrying all before them, that is, no one ever dreams of dissenting from their opinion, and their fellow-judges, the exhibitor, and the public generally, are fully satisfied with all their awards.

We generally find that the cultivation of specialities is carried down from father to son. The old herds, the old breeds, the old studs, and in cases of this sort the son is "at school" from his earliest youth. He hears the qualities of pedigree, form, and quality continually discussed. He knows *which* are considered the pick of the stock, *which* find a ready sale. He compares the home produce with what he sees at shows, and if he loves his profession, and has decent abilities, by the time he has reached maturity he ought to be a good judge without any special making. He ought to assume before his elders a modest demeanour (whether he feels it or not), and he should be able, clearly and concisely, to give the reasons that influence his decisions. It is no use saying "That roan heifer is a better beast than the red and white," and have no other reason to give than "I say so," or "Father thinks so." It is not necessary or desirable that the public should know every point by which the judge arrives at his final award, but he should be able to tabulate it all to himself if need be.

Those who read the horticultural part of this paper are quite familiar with the system of judging by points, and a fairer one cannot exist, and if the public would be at the pains of going rather more into detail than is their habit, we should hear less of ill-considered objection to and adverse criticism of the judges. Let discontented horticultural exhibitors take this to heart as well as farmers. It is ignorant, self-opinionated people who are always the worst to deal with, and if they would just allow themselves to

consider the pros and cons, they would not fall into the error of condemning the judges unheard.

We have just come across a good "notion," to use a Yankee expression. The "notion" did originate on the other side the water, and has been adopted with good results by the instructors of agricultural youth at Wye, Kent. These lads may not all have had the advantage of fathers whose whole and sole aim was to produce, say, A1 Shorthorns, and consequently they need what may be termed an A B C guide to the art of judging. We think the plan might well be extended beyond the college precincts. The young beginner is given a card thus arranged:—The animal taken is a perfect cow of the Shorthorn breed; her good points are described clearly and briefly, and a maximum number of marks assigned to each amounting in the aggregate to 100. There is a column for marks which give the pupil's estimate, and there is also a column for the instructor to place his record. Doubtless at first the two columns will not agree, but the lad will find out where his estimate and that of the professor differs. It is really an object lesson of most practical value, and reduces the art of judging to an exact science. These cards act as sort of "leading strings," and, as the judgment matures, can, of course, be altogether done away with. We notice the highest number of marks for any particular feature obtainable by a good cow is twenty for the udder. She can also earn two sets of ten, one set for form and quality, and another ten for temperament and colour.

The card before us mentions one or two undesirable points which would materially spoil the total of marks did they exist in the animal before the judges. We should think it highly probable that this card system will be extended till it embraces all classes of stock on the farm. Competent men would soon arrange a set, and we believe they would be found of great service to other than the young pupils or students at the agricultural college. We believe in Shropshire the young farmers have competitions of this nature. Their knowledge is increased, and their wits sharpened.

"Punch" is again on our track. The never-satisfied-farmer joke is a very old one, and although we are tired of it, it goes to prove what we believe to be strictly true, that the average of the hay crop is very high and the quality first-rate. For the last few years there has been great "shortage" both in hay and straw; this year we look for bumper crops, and it is only the farmer whose stock has been on short commons, and whose fold-yards have been absolutely denuded of bedding, can tell the relief and comfort there is in a full stackyard. We will hazard no opinion about the yield of corn, that is always an unknown quantity; but we can see and fully appreciate the wealth of straw that promises great things in every field.

## Work on the Home Farm.

Heavy rain, far more than is expressed by the word shower, has fallen almost daily; it has suited the root crops exactly, especially Potatoes, which can never have too much surface moisture in July. Swedes present such an appearance as no living farmer can remember, and if this does not prove a record year for roots we are much deceived. The rain has laid some of the cornfields, but not so extensively as we anticipated, which may mean that the crops were not so heavy as they appeared; the real fact we apprehend to be that the straw, though long, is fairly sturdy, and being very thick on the ground is not readily storm broken.

Little hay is left out about here; but a visit to a neighbouring county last week revealed not only much hay, but some Clover still in the fields. On inquiry, we found that spring keeping had been so scarce, and the mowing Clover and meadows had been grazed so far into the month of May that the hay crop was necessarily a late one. These late crops are good, and far heavier than those laid in earlier and now safely in stack; but they are still in the fields, and their ultimate value very problematical. It is the old story—"You cannot eat your cake and have it." In this case there may be two cakes, but the second, though big, may be very tasteless.

The showery weather is delaying the corn harvest, which will hardly commence before August 20. Wheat is well set in the ear, there being few deficient grains. Barley, too, is well set; but we are sorry to find a large number of dead, or dying, heads in some fields. We have carefully examined a number of stems, and have found no direct evidence of its presence, but we think that the Hessian fly is really responsible for the death of some portion of the plants. This insect attack appears likely to discount what might have been a record crop.

## Garden Fruits in Warwickshire.

HE present time seems a very apposite one, not only for summing up and chronicling results to date, but for gauging the practically assured autumnal crops, or, rather, what there are of them, some being, I fear, conspicuous only by their absence. *Tout passe, tout passe, tout casse*, as the French saying is—nothing indeed endures, everything is ever in a transition stage, increasing at its zenith for a tiny span, and finally decreasing. We have reached a period, taking England generally, betwixt and between, as it were, the summer and the autumn. That bugbear the weather is, unfortunately, of the very essence of the whole business, and it may be a wholesome thing to get rid of one's inevitable grumble at this early stage in these notes.

The English summer is credited by a wag with beginning the 31st of July and ending the 1st of August. Probably, anyhow for low temperatures generally, this season is a record. Even in the last lap of July, morning after morning, the quicksilver on the wall has refused to start affairs higher than 52deg to 56deg Centigrade, with a preceding night temperature no doubt considerably less; *par consequent*, the ungenial conditions all through the germinating and growing time have borne a good deal of, figuratively, bitter fruit, which may be taken to mean, in fact, no fruit at all in many cases.

Whether or no Royal Warwickshire may be taken as a type I know not; but, speaking from our coign of vantage in what is almost to a mile generally reckoned as the exact centre of England, the writer ventures to give the following points. Generally speaking, all fruit against walls not only set, but so far has matured very well. Thus Apricots, Plums,

READERS are requested to send notices of Gardening appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

and Pears in our walled garden promise excellently. Out in the open the case is lamentably different. To begin with, the modest, but, beyond all fruit at that stage, useful, little green Gooseberry. Whereas we are usually almost crowded out, so prolific is the supply, this time the crop is a very sparse one. The Strawberry, which Dr. Boteler in his quaint language shrewdly pronounced as the best fruit of any, has, on the other hand, proved eminently satisfactory. Fine big berries, owing to the abundant rains, were produced, and ran their race in first rate fashion. The same tale throughout the genus, whether Royal Sovereign, Dr. Hogg, Veitch's Perfection, or the truly superbly flavoured White Pine, a Strawberry deserving to be much better known and more widely grown than at present; at any rate, in private gardens, making, as it does, so elegant a dish for dessert when contrasted with its fellow sister the red. I have for some years pursued a rather novel course as to the arrangement of the fruit now under mention. Along my entire borders, whether main or cross paths, there are to be found my Strawberries. It has the preference over the customary box for its beauty when in flower in the spring, and its utility and the extreme facility with which it is gathered in its later stages.

As to Raspberries, whether a local trait or not, this berry's condition is peculiar this year. The fruit does not readily part from its kernel; otherwise the crop, but for a superabundance of the bird tribe more than usually in evidence just now, might be pronounced a normal one. Alas! too, my modest modicum of Cherries have all been a prey to the devouring little bipeds, this impudent crew looking upon the luscious product as their natural perquisite. And in this connection I must enlarge my doleful note to record the dire havoc these intruders committed in anticipation so long ago as last autumn. Just before the winter of their discontent set in, I discovered to my chagrin all the plump young buds of our excellent three-year-old Currant bushes—Red, White, and Champagne—had been entirely stripped from the branches and shoots. The Black Currant, being apparently too harsh, they leave religiously alone; neither till very hard up do they attack these when in fruit, though I think those incorrigible offenders the blackbirds have a go at them for a change even while the ruby kind is still on. When one comes to think of it, the summer menu of the birds about a choice garden is a pretty fair one, and I suppose there are a good many epicures among them as in the human race.

But to pass on. "The promise of May" as regards Apples, Pears, and Plums was bridal and bountiful in the extreme. Alike in garden and orchard, the place was a feathery bower of bloom, reminding one of that enchanting prospect the Ueno Park in distant merry Tokio. But alas! how contrary the result in these different locale. The one was taken and the other left! In plain words, except where grown against the wall (and I certainly have no fault to find with my splendid show of Jargonelles) the Pear has almost entirely failed, the accommodating little pyramids being almost fruitless, while the Apple is but one degree better. Against this, however, in the latter position, viz., the orchard, the Apple crop has set and matured to a really fine crop, and looks at the present juncture remarkably clean and healthy, a grand spread indeed being borne by Early Margaret, Codlin, Wyken Pippin (so popular in this part of the Midlands, and raised originally in, and called after, our adjoining village), Northern Greening, and Royal Russet, while those grand fruits Beauty of Kent and Warner's King are no whit behind in size and quantity; besides which, the Ribston, Eve's Pippin, Foster's Seedling, Queen Caroline, and Shropshire Wonder all should weigh in a good many bushel credit to the tree. The only kinds not doing themselves full justice, so far as I am concerned, are Winter Queening, which had, however, a bumper crop last year; Besspool, and Blenheim Orange. This last, however, is an old, or, rather, young offender. To be more explicit, it is taking the full share of its customary slowness in coming into proper bearing, for, judging by its age, it is no chicken, full twelve to fifteen summer suns and winter rains having nourished its growths. Talking of the Apple, why, I wonder, did the ultra inquisitive lady select this particular kind when she asked a leading divine quite *au sérieux* whether the Apple that Eve ate was a Ribston or a Blenheim Orange! Alas! that the good old Ribston is practically a thing of the past. Taking Plums next, exactly the same remark applies as to the Pear. Against the wall they are excellent, out in the open practically nil, though the blossom was superb. The

prolonged low temperature and continuous night frosts, I suppose, plied their deadly work all too surely.

I may conclude this brief epitome with a word on the Walnut. Such a crop as we had the luck to harvest in *l'année passée* I never remember before, nor even dare expect to see again. Our trees are remarkably fine spreading, full-sized park ones; still the bushels and bushels obtained last fall were simply amazing, consequently I must be lenient in criticising their offspring this year; and it is no surprise to find but a meagre promise of the nut which in old-fashioned times hobnobbed so well on the mahogany with the good old crusted port of the delicious fruity flavour we so seldom taste nowadays. Possessing as I do two different kinds, the huge double borenut and the common normal shaped and sized one, the trees this season seem to have accommodated themselves pretty well to circumstances, for while the former, exhausted by their excess of a year ago, are about to yield not much more than a pittance, the latter and smaller sort has risen to the occasion very well, and again bears a really capital array. My little nuttery, moreover, situate in an island all to itself, is, perhaps partly owing to a good clearing out given it at winter time, well in evidence with something more than a mere sprinkling.—J. A. CARNEGIE-CHEALES.

## The Cheddar Pink at Home.

The pretty native Dianthus or Cheddar Pink, the Cliff Pink, as the Cheddar folks term it, is very lovely just now, on the famous cliff from which it takes its name, and a ride of about twenty-five miles was well repaid by a sight of it in full beauty this week. There is little fear of this charming plant becoming extinct, notwithstanding the hundreds of plants that are yearly torn up by trippers from Bristol, and to their shame be it said by the natives of the locality themselves, for though all within reach, or nearly all, have disappeared, there are numbers of immense masses of it, hundreds of feet up on these wonderful cliffs, quite out of everybody's reach. Seeds from these, of course, drop and are blown to lower elevations, and there are always a few flowers to be picked, but its stronghold higher up is safe enough, and the flower hawkers who deplete our hedgerows of the beautiful Ferns, Primroses, and other native plants are too careful of their skin to attempt an attack on them.

To those who are not acquainted with it the Cheddar Pink is very similar in habit to the common garden Pink, but smaller; the flowers occur usually on single flowered stems, are about 1½ in across, of a very delicate rosy pink in colour, and deliciously fragrant. Seeds collected in late summer and sown on old walls or rockeries germinate freely, and form very beautiful clumps that in June and early July are covered with flowers. This is a far more satisfactory way of establishing it than the usual method of tearing up the plants when in flower, carrying them about in the heat, and eventually planting them, only to perish miserably.

Besides the Pink there are many other beautiful native plants that grow very freely in this locality. The graceful Meadow Rue or *Thalictrum* is very freely represented, its Fern-like foliage and tall graceful spikes of flowers being very charming. Probably its inconspicuous colouring is its salvation, for it abounds on every hand quite within the reach of all. Ferns are not particularly plentiful, except a few common sorts, but higher up the gorge, growing in the cool soil beneath shoals of loose stones, is a quantity of the deciduous Lady Fern in variety. *Ceterach officinale*, and *Asplenium adiantum nigrum*, and the *Trichomanes* are everywhere, while growing among the stones is a bright golden yellow Poppy, as bright as the golden *Eschscholtzia* and as showy. In growth it is very similar to *P. Rhæas*, of which it is probably a variety. (Does any reader know of a golden yellow form growing wild?) I could not get seeds, as the earliest flower had only just fallen, and most of them were in full beauty, but I hope to later on. The Red Valerian was in full flower, but the pretty Harebells, Toad Flax, and others are not yet. Great masses of Sun Rose were a blaze of yellow in various places, and many other wild flowers of equal beauty, so that a visit to this neighbourhood, leaving out altogether the marvellous stalactite caves for which it is so justly famous, is full of interest to the lover of our native flora.—H. R. RICHARDS.

**Lælio-Cattleya Canhamiana alba.**

For size and handsome appearance this is a most commendable Orchid. Messrs. Hugh Low and Co. have staged plants of it frequently and well at Drill Hall meetings during the past season, and both Messrs. Veitch, Ltd., and Sander and Sons also include it. Coming as a hybrid from *Lælia purpu-*

As a rule the smaller members of the genus are the first to need attention, *O. Cervantesi*, *O. Oerstedii*, *O. Rossi*, and similar species, following on with *O. crispum*, *O. Halli*, *O. triumphans*, and their near relations. The first-named species are best grown in small pans or baskets for suspending, and should they now be in unsuitable receptacles, advantage may be taken of the time to make the necessary correction. Plants of larger growing sorts that are doing well in small pots may be shifted to those of larger size, and other plants that do not usually need repotting may have a little of the surface compost removed and replaced by new, in the form of surface dressings.

It will be noted that when a plant, say, of *O. crispum* is doing well, and has filled a 3in or 60-sized pot, that it is not wise to give an intermediate shift to the 4in size, but place it at once in a 48 or 5in, the greater freedom for the roots

**Lælio-Cattleya Canhamiana alba.**

rata and *Cattleya Mossiæ*, it has two of the best known and most prized species in its constitution, and in habit comes near to *L. purpurata*. The sepals and petals of the variety *alba* are white, the lip dark purple, and the throat veined with brown and gold.

**The Week's Cultural Notes.**

The shortening days remind one that it will soon be time to give attention to the *Odontoglossums* and other inmates of the cool house. A stock of pots, labels, and other requisites should be got ready, so that the work may progress quickly when once started. The plants should be given a look round, and all that are ready for repotting selected. The proper time for the operation is when the new-growths are about half formed, as it is just then that new roots are produced, these new roots serving to re-establish the plant in the new compost, that helps in turn to swell up fine young pseudo-bulbs.

serving to carry more nutriment, and incidentally the plant is not so liable to injury as when given a small shift. Naturally, when giving this large shift a great deal of care is necessary with the drainage, but it is advisable, none the less. Again, no one of any experience would think of shifting a plant that was not doing well into a large body of new material. Only the robust specimens can be so treated.

There is not space here to go fully into the details of potting, but as this was given rather recently when speaking of the genus as a whole, those readers who seek instruction on this point may perhaps, look up their back numbers with advantage. It is not wise to give very heavy supplies of moisture immediately after repotting, but as new compost dries more rapidly than old, fairly frequent attention will be needed to keep the sphagnum moss alive and growing. Light sprayings of tepid water from the syringe are useful, and the rose of the syringe should be used when watering the roots.—H. R. R.

## Across the Bay.

Gone are the glories of Donnybrook Fair, and where, erstwhile, the low-backed car ambled o'er the rocky road to Dublin, Peggy of to-day sports the free wheel. Such things live only in Irish song and story; but the eternal hills guard the bay unchanged.

How like eternity doth nature seem  
To life of man, that short and fitful dream.

From our terraced garden we look across the bay to where Howth Head in a gauzy cloud-cap runs far out till its beetling brow, frowning down on the flashing light of the Bailey, drops abruptly to the sea. It is early morning, and the working world, or our portion of it, sleeps the sleep of the just (or lazy, it's hard to get 'em up). What a glorious bit of landscape and seascape it is! The peculiarity of the promontory bringing in the more distant objects of Lambay Island and the miniature islet, Ireland's eye. Glorious? Aye, simply glorious now the rising sun is bathing all in warmth and colour. Truly a worthy study for those artists whose peregrinating propensities lure them from the beauty spots at home. The "White Banks" between the Pigeon House and the Poolbeg sport a green peruke after the recent rains. From here, by courtesy of my Lord Pembroke, we cart, when tide permits, that coarse, white, shelly sand so admirably adapted to all potting purposes. 'Tis a treacherous task though, and our man has to "look alive" lest he should meet the fate of another sand-fetcher, who, a few summers since "got caught"—just escaping on his horse, the cart coming after in fragments on the flood tide. Beyond a growth of scutch-like, breeze defying grass binding the loose sand on the crest of the White Banks, and *Eryngium maritimum*, the Sea Holly, in profusion, a botanising expedition yielded no further fruits save an enormous pair of brogues which some fellow traveller had cast off, doubtless to his great relief.

Just where old Howth (pronounce it Hoathe, please) rises from its sandy neck, stands out clear and distinct a many-gabled, red-roofed mansion, an additional attraction to looking across the bay, for there an old friend and onetime neighbour works his labours of love in gardening generally, and amongst a profusion of hardy plants and flowering shrubs in particular; such, indeed, as in variety and disposition are rarely met with. "Come and see. . . . Yours very truly, Gerald Carroll." We went, and saw a host of things beautiful and interesting, too numerous to detail, but rather is it the *tout ensemble* of the grounds and gardens around Sutton House which appeals to the gardening critic than individual specimens or masses. The informal, picturesque, and extensive residence lends itself admirably to the situation, the grounds surrounding it forming such a happy blending of nature and art that one wends their way from highly-kept terrace walk to the rugged simplicity of the Head unconscious where the one ends or the other begins. Choice specimens and groups are noticeable near the mansion. There is a dark foliaged clump that might be passed as that purple Plum of uncouth name which has entered so largely into modern planting; but "The master," Andrew Jameson, Esq., whom we meet inspecting his treasures, in which he takes a keen interest, points it out as *Rosa ruberrima*.

A sturdy hedge of the Sea Buckthorn, *Hippophae rhamnoides*, guarding the descent to a dell, is charming in its berried wealth during the dull season, its secret of vigour being the sea, so near at hand that westerly winds, which are dreaded here when angrily disposed, must all but carry the spray into the grounds. In its happy abandon of planting and keeping the higher portion of the grounds approaching the Head there is an added charm to the culture of hardy plants, conspicuous by its absence in orthodox bed or border, or even rockeries as often seen. Here one picks their way around clumps of the little Rock Rose and similar things, with ubiquitous turnings on either hand by natural walks, with here and there a rough flat stone so disposed as to ensure a foothold. Whilst meditating and arguing, as gardeners will argue, on that hot summer Sunday, a bolt from the blue, in the form of a heavy thunderclap reverberating to the opposite shores, our own side of the bay, caused a hasty descent to the more sheltered part of the gardens. Here, in the gloaming, we wander through the alleys and paths of a quaint bit of old-world gardening quite secluded from aught else. It is the original garden, and is kept pretty much the same as when its former owner, the late Mrs. Lawrenson, enthusiastically worked up her grand

strain of St. Brigid Anemones prior to changing her residence across the bay. There is a giant standard *Ceanothus*, large enough to picnic under, huge Bamboos, and ancient Dijon Roses, with many beautiful Teas, now at their best, ramble away over tree and trellis pretty much at their own sweet will. A curiosity in cut stone, in the form of an antique coat of arms is embedded high up in the wall, and zealously preserved by Mr. Jameson. One would like to know with what old family it is identified, but probably the heraldic memento now pertains to those " . . . whose bones are dust, and souls are with the saints we trust."

Our friend has a handsome clean crop of Melons to show us in a small lean-to stove, and other glass houses have to be inspected. The glass department is not extensive, and G. C. would like more. Was there ever a gardener worthy of the name who would not? However, from the encouragement he has already received from a generous master, he will doubtless sooner or later be the happy overseer of some good vineries in place of the present old-fashioned structures, for which there are positions against the high, massive walls suggestive of suitability for their erection. Vegetable and fruit quarters at Sutton House are extensive, and pre-eminently well cropped and kept; a feature of these being a strongly-stayed palisading to protect all from the breezes of the bay. We could not but admire our friend's comfortable cottage, the healthy look of his olive branches, and the liberal hospitality of "the missus," and not less his agility, as at a late hour he rushed after and held up the last electric car, saving us from being stranded at night across the bay.—K., Dublin.

## Potting Primulas.

As good strong plants of Primulas which are likely to throw up vigorous flower stems in autumn, winter, and spring are appreciated, the stock now established in small pots and needing a shift should be looked over. Select those which have their pots full of roots, bushy fibrous roots, pushing freely round the edge of the surface soil. The leaves should be stiff, luxuriant in colour, and have short stalks. The latter are always brittle, but more so when the plants have been crowded and are consequently flabby. Flower stems issuing from the centre may be nipped out at present, both from Chinese Primulas and *P. obconica*. The leaves of the latter variety cause irritation of the skin with some people, so it may be advisable to protect the hands with gloves when handling these plants.

A suitable compost consists of three parts turfy loam, one part clean leaf soil, one part decomposed manure with a free admixture of sand, crushed charcoal, and a sprinkling of wood ashes. Incorporate all together, bringing it to a moist, though not a wet, condition. Employ clean, dry pots, crocking them carefully, and cover the drainage with some clean rough material. The plants must be moist before turning out of pots. Loosen the bottom roots and remove the crocks they enclose. In the actual process of potting sink the ball so that the plant will be rather deeper in the soil than heretofore. In fact, when the potting is finished, the plant ought to be quite secure and not wriggle about at the collar.

A moist frame covered with a light is the best place for them at first, giving the plants ample room. Water will scarcely be needed for some days, but afford shade from strong sun, and dew the plants over in the evenings of warm days. The first watering should be copious enough to pass through the whole mass of soil and roots. When renewed growth becomes evident by the production of young leaves in the centre, and the enlarging of the older foliage, fresh supplies of air are necessary daily, and on warm nights full exposure is beneficial; but guard against soaking them by allowing heavy rain to reach them.

As a means of affording the plants when growing freely all the advantages of free ventilation to induce a stocky habit, the plants may be elevated on small pots. Allow room to place the lights over, though the frame will rarely require to be completely closed down. Here the plants may remain until it is necessary to house them on a shelf near the glass in the greenhouse early in October. If wanted to bloom in the late autumn, the first flowers should be left to develop. For a later display nip out the trusses which show now.—S.

#### The Rapid-growing Hop.

It is strange the Hop Vine does not figure more prominently in plantings where a rapid-growing vine is wanted. In the fall it dies to the ground, coming up again luxuriantly in the spring. The leaf is rather large—just a trifle coarse, perhaps. There is also a golden-leaved variety. Notwithstanding the commercial connection, the plant is valuable as an ornamental.

#### Growing Tomatoes.

Most growers of Tomatoes for sale or export aim at producing very large smooth fruit. That the smooth variety is preferred to the wrinkle kind is evident from the fact that the public, as a rule, do not care for the latter, and that a better price can be obtained for the former. But abnormally large Tomatoes are a mistake. As a general rule, the public prefer a moderate size. The housewife does not like getting two or three fruits to the pound, because there is often much wasted in the large sizes. From 2in to 3in in diameter is quite large enough, and such Tomatoes will always command a better price than the very large ones, which are more useful to the cook for "fancy work" than for general purposes.

#### The Fruit Crop.

Looking at the fruit crop no one will doubt that the frost has hit us hard this year. Most gardening people have suffered, some more, some less, but all in a degree. Everybody feels himself to be the most injured, too, which is our natural way of looking at things. The fruit-grower, who has hundreds of pounds at stake, may be, complains no more in his way than an amateur friend of mine who grows Irises for a hobby, and was nearly heart-broken when the frost spoiled all his chances of bloom. In a general way, however, we can only hope that matters will not eventually be so bad as they appear to be, though I doubt many fruit-growers and market gardeners will have reasons to remember the May frosts of Coronation year.—H.

#### What a Price!

It is obvious that any amateur who is ready to hand over £425 for a single plant of an *Odontoglossum* must not only be willing, but also in a position to pay for his hobby. I saw the plant which fetched the above sum (figured on page 507, last vol.) at the Temple Show, and agree that it was one of the finest there. But four hundred and twenty-five golden sovereigns for a plant that might take a perverse fit and die next week! Almost incredible, isn't it? It may be accounted for by the fact that the present owner will be able to say that no one else has got one like it, which I believe is a reason why many art treasures and antiquities fetch such long prices. One would like to learn the history of *O. crispum ardentissimum*, which, I suppose, was no more romantic than the rest of the *crispum* family, until it flowered and revealed its character.—G.

#### Durability of Different Woods.

Experiments have been lately made by driving sticks, made of different woods, each 2ft long and 1½in square, into the ground, only ½in projecting outward. It was found that in five years all those made of Oak, Elm, Ash, Fir, soft Mahogany, and nearly every variety of Pine, were totally rotten. Larch, hard Pine and Teak wood were decayed on the outside only; while Acacia, with the exception of being also slightly attacked on the exterior, was otherwise sound. Hard Mahogany and Cedar of Lebanon were in tolerably good condition; but only Virginia Cedar was found as good as when put in the ground. This is of some importance to builders, showing what woods should be avoided and what others used by preference in underground work. The duration of wood when kept dry is very great, as beams still exist which are known to be nearly 1,100 years old. Piles driven by the Romans prior to the Christian era have been examined of late and found to be perfectly sound after an immersion of nearly 2,000 years.

#### King Edward's Oak.

When he visited New York some forty years ago as Prince of Wales, the King planted an Oak in the Central Park, New York. Some two months ago, when the King was taken ill, the tree began visibly to fail, and was thought to be dying, but owing to the judicious treatment of the landscape architect of the park it has revived, and now seems to be, like its planter, in a fair way towards recovery.

#### Coronation Carpet Bedding.

The gardeners in Victoria Park, the great East End breathing space, have just completed their Coronation bedding. The chief feature is an immense scroll near the boating lake. This is nearly 150ft long, and bears the motto, all in various colour plants, "God and His Angels guard thy sacred Throne, and make you long become it." Underneath, in patriotic-coloured flowers, is the prayer, "God save the King!"

#### Electricity as a Stimulant.

Electricity for stimulating the growth of cereals, vegetables and other plants has been tried in many experiments by Dr. Selim Lemstrom, the Norwegian investigator. On arable land of medium quality, an increase of 45 per cent. in the crops has been obtained, but the increase is greater in proportion to the care in cultivation. The effect is trifling on poor soil. The electric current proves injurious to most—if not all—plants in hot sunshine, and such plants as Peas, Cabbages and Turnips are favourably influenced only after watering. Estimates of cost lead Dr. Pringsheim to conclude that electricity in agriculture will pay.

#### Phlox Drummondii nana compacta.

Phlox Drummondii is, of course, grown in every garden, but everyone may not be acquainted with the dwarf form under notice. Let me advise any who have not grown it to make a beginning this season. All the glowing colours of Phlox Drummondii are represented in the dwarf forms, but the habit is compact, and when grown in masses the diversity of colour is very striking. The plants are also very useful for edging purposes, and are also suitable for pot culture. During the hot summer of last year, when most of the annuals were sorely tried, these dwarf Phloxes kept up a bright display of flower and were generally admired.—H.

#### The Lightest of Woods.

Deep in the bogs and swamps of South-eastern Missouri, there grows a rare and curious tree known as the Corkwood or Cork Tree, or in science as *Leitneria floridana*. It reaches a height of 15ft to 20ft, and a diameter of 2in to 5in. What makes Corkwood so remarkable is its exceeding lightness, it being the lightest tree in weight that grows. It is so light that the natives use it to make floats for their fishing nets; and yet its wood, though so spongy one may easily sink one's finger in it, is far tougher than cork. The specific gravity of corkwood, as learned from careful tests, is 0.207. The roots are even lighter than the stem; a test showed them to have the astonishingly low specific gravity of 0.151. The great majority of woods range between 0.400 and 0.800. Cork itself is 0.240.

#### The Orange.

The Orange is of comparatively modern introduction in horticulture. It is not mentioned in the Scriptures, nor by Herodotus, who lived five centuries before Christ, and who wrote a list of fruits then known, nor by Virgil, who wrote much about such matters 100 years before the Christian era. The Orange came originally from the south of China, Burmah, and India. It is found growing wild in the jungles in various parts of India. The Arabs introduced the Orange to their country, and thence it got to Syria and Southern Europe. This was probably the Bitter Orange. The sweet variety was brought to Europe about the fourteenth century by merchants of Genoa or Portugal. Thence the tree was passed by the Spaniards and Portuguese to the Azores and other parts of the "New World," and found congenial conditions. Mexico, Florida, California, proved to be highly suitable. The St. Michael Orange originated in the Azores; the Pernambuco and Bahia (or Navel), were both named after provinces in Brazil. The Orange is now found growing in nearly every country where there is enough sunlight and absence of severe frosts.

#### Insect-proof Roses.

Rose bugs and leaf slugs are so numerous some years, one is easily discouraged in outdoor Rose growing. The Japanese *Rosa rugosa* and the *Wichuriana* Roses are very much of an encouragement, for thus far they seem to have evaded the pests. This may be accounted for in the late blooming character, the major part of the Rose bugs having completed their destructive work and disappeared, and also in the rough leaves of the *rugosa*, and the tough ones of the *Wichuriana*. *Rosa rugosa*, both red and white, are being largely used and their value appreciated. The others have not yet come in for their full share of popularity as arbour vines and for trailing over low walls. An attractive way to have a few plants is to stake them and allow the branches above to fall gracefully over. (See illustration.)

#### Rose Field Marshal.

This new Rose, which received an Award of Merit at a recent meeting of the Royal Horticultural Society, is a very handsome free-blooming, climbing, crimson China Rose, introduced by Messrs. Wm. Paul and Son, of Waltham Cross, as a companion to *Maréchal Niel* in the greenhouse, and also excellent for climbing out of doors, where it can have the protection of a wall or building. The flowers are very deep rich blood-red, of the colour of *Cramoisie Supérieure*, but nearly twice the size of that variety, fuller, and more even and regular in shape, many of the blooms produced at Waltham Cross rivaling *Maréchal Niel* in size and form. No climbing Rose in cultivation equals *Field Marshal* in richness of colour, combined with regularity of form, the nearest approach to it being the climbing form of *Cramoisie Supérieure*, to which it is immeasurably superior in the points named above. It is not yet in commerce, but plants will be ready for sale by May. (See illustration.)

#### Rosa Wichuriana.

It would be impossible to over-estimate the great usefulness of this Rose and its progeny for covering gravel banks and barren spots in the landscape; although now well known, they are not, perhaps, so extensively planted as one would naturally expect. In the making and renovating of the home grounds, parks, &c., gravel banks and other unsightly places are invariably exposed to view; not necessarily by design or accident, but arising from various other uncontrollable causes. There is a limit to the variety of plants adapted for such situations, but the difficulty has of late become somewhat reduced by the introduction of a number of splendid hybrids, emanating from *R. Wichuriana* and the Tea Roses. That these have been gladly welcomed by the landscape gardener is inevitable.

Now that the dormant possibilities and expectancies of crossing this *Rosa* with the Teas has been discovered, it is more than probable (says the "Florists' Exchange") that each year will produce other additions to the existing list. *Pink Pearl*, *Gardenia*, *Jersey Beauty*, *Evergreen Gem*, *Manda's Triumph*, *Pink Roamer*, *Universal Favourite*, *Scuth Orange Perfection*, *White Star*, *Crimson Roamer*, all have inestimable qualities.

Where it is desired to create what landscape men lovingly call a "natural" effect, do not hesitate to plant the above list: in two years the plants truly present all the careless abandon of Nature. As some of these varieties are extremely vigorous, making from 35ft to 40ft of growth in a season, it is not wise to plant them too near to other choice things, for in the usual struggle for life and superiority the Roses will win out with honours. We have several banks here that would now be a most interesting study to students of the "survival of the fittest" theory; in fact, most useful data could be secured. We are watching a fight now in course of progress between a section of *Honeysuckle* and *Rose Pink Roamer*. The latter pushes out its great, sprawling, octopus-like tentacles over the *Honeysuckle*, something like a spider grabbing a fly; the *Honeysuckle* resents this by quietly hitting the *Rose* below the belt. *Pink Roamer's* great shoots are now being gradually drawn into the net of the *Lonicera*. We now think the *Honeysuckle* will win. The case is different with small trees and shrubs, and if the Roses are not kept within bounds soon the former become swallowed up.

If you have a bank planted with "any old thing" and wish to change this from bad to artistic, grub out a shrub or two here and there and replant with some of the strongest growing of these hybrids; in two or three years that bank will be a

dream. These Roses will thrive well under trees, if a reasonable amount of light is obtained. *Jersey Beauty* is grand for this purpose. I have in mind a group of *Silver Birch*, with this Rose as an under cover. The flowers are 3in in diameter and of a soft yellow, with bright yellow stamens, and in profusion. An effort of this kind is refreshing and enjoyable, and will do more to soothe a ruffled mind than kind words.

Before planting, the soil should be well grubbed and manured, this is particularly necessary when planting under trees; it induces the plants to move quickly. Plant about 5ft apart, or even closer if immediate effect is desired. Nothing in the line of insects seems to bother these Roses other than that little green caterpillar, which we all knew so well in connection with Roses. In slug shot we have a faithful friend and an infallible remedy. It matters not, on analysis, what may be the market value of its chemical constituents, it does the work required with dispatch and certainty. We have never had to give more than one application per annum; it's worth a dollar a pound to you, after you have been humbugging around with other things.

*R. Wichuriana* seems to have one advantage over its progeny in flowering later. It arrives on the scene with a cheerful gaiety, most acceptable after the hybrids have been and gone. July 15 it is in all its glory with us; and at that time, when most of the flowering shrubs are over, it lights up the landscape and is gladly welcomed.

## Notes on Pines.

#### Preparing Houses for Plants.

Thorough cleanliness is very important in the cultivation of Pine plants: wash the houses, therefore, as they become vacant before being again employed. Attention must be given to beds, as bottom heat is absolutely necessary. Whether the beds are of tan or leaves, the whole should be removed at least once a year, as insects, particularly woodlice, rapidly increase, the old material also harbours other vermin. All brickwork must be scalded and brushed with fresh-made limewash, the wood and ironwork with carbolic soap and water, thoroughly cleansing, using a brush, keeping the soapy water as much as possible from the glass, which should be cleansed inside and outside with water only. If necessary the wood and ironwork may be painted, always in time for the paint to become hard before putting in the fermenting material, the roof being made as watertight as possible. Beds that are chambered—that is, the hot-water pipes covered with slate or other material—are much in advance of those surrounded or passing through beds of rubble. Those composed of the latter should be turned over, and any dirt removed to allow the heat given off by the pipes to penetrate the whole uniformly to the bed. Provide fresh tan in other cases; if wet, turn it occasionally on fine sunny days. With hot-water pipes beneath about 3ft depth of tan is ample, but more will be needed where such aid is not obtained.

#### Potting Suckers Started in June.

When these have filled the pots with roots, shift them into larger pots before the roots become closely matted together. Queens are accommodated in 9in or 10in pots, and those of stronger growth in 11in pots. Give water immediately after potting if the soil be at all dry, and plunge in a bed having a temperature of 90deg to 95deg. Avoid crowding the plants, this being one of the greatest mistakes made in growing young Pine plants, as they become drawn and weakly instead of having a sturdy base, a condition that should always be secured if possible.

#### Routine.

Attend to the bottom heat of beds that have been recently disturbed or upset by removing or replacing plants, not allowing the heat to exceed 90deg at the base of the pots without being immediately raised, as too much bottom heat will disastrously affect plants with fruit, or those having the pots filled with roots. Examine the plants for watering about twice a week, and maintain a moist, genial, well ventilated atmosphere. The climatic conditions are now so favourable that Pine plants grow luxuriantly, therefore discontinue any shading, such as may have been employed for an hour or two at midday when the sun was powerful through the months of May, June, and July, the plants after this having the benefit of every ray of sunlight, admitting air plentifully when the temperature ranges from 85deg to 90deg, affording fruiting plants a night temperature of 70deg to 75deg. Some suckers should be reserved on the old plants for starting in September.—PRACTICE.

## A Spring Day in British Columbia.

There will soon be thirty lumbermen felling some of the giant Douglas Firs in our valley, then floating them down on what should be called a "lagoon," but is horribly styled a "slew," though it has no resemblance to a "slough of despond" or of any sort. The trees will be put into rafts and so sent to the Fraser River, when it is at flood in May or June, and then navigated by loggers to the Harrison Sawmills. All this will be new to me, for the only tree-felling we do on the farms here has been to clear the land for cultivation and then set fire to the giants as they lie on the ground. There is not much of this laborious work to be done on the farms in the immediate vicinity, but a few miles "up the slew" the Cedars and the Pines are magnificent, and the lumbermen have found them out. The prohibition issued in January last against the exportation of logs into the United States has already worked marvels of benefits to the sawmills, lumbermen, and trade generally of British Columbia. I heard to-day that all the sawmills could run day and night if they could get the logs, as the huge trees are called; so our valley is to be busier than for some time, and the sound of the woodman's axe will be heard all through the spring and summer.

I see that our Agent-General has been giving a useful lecture about British Columbia. He related how some young man asked him about revolvers and guns, and how many he should take if he went to British Columbia. I think I should advise everyone that keeps poultry to have a gun if he can shoot, for hawks come and there are lovely wild ducks and grouse, and the blue jays and the robins (really thrushes) play havoc in the kitchen garden if no one teaches them to respect the rights of property. Revolvers are strictly forbidden. If brought at all they must not be used except on burglars! then a gun does as well nearly. The birds of prey harry my neighbours' poultry terribly. They know who shoots straight, and do not come here.

I wonder every spring, as the various beautiful shrubs begin to burst into leaf, whether many settlers will come our way this year. The Canadian Pacific Railway Company shows that the traffic grows, but what would be cheering would be that every passenger train disgorged its living freight of earnest home-seekers who would hire traps, pester every one with questions, make sketches or "kodak" the scenery and farms and make plans, and then come and settle, if not at Agassiz, in some equally lovely district. The sort of thing they could see and kodak would be what I saw yesterday a couple of miles from my own more recent farm-home. I set out to walk to my farmhouse, and as I went listened to the birds twittering their first notes, and the thrushes—absurdly called "robins" here—piping the

three first notes of the English thrush's song, then stopping short. Then I listened to the "slew" making a noise like what we call the "rippling" of a brook in England, and noted the changed look of spring coming over the Birch and Maple trees. The clouds were skimming along the face of the Great Mountains, all deep china blue for two or three thousand feet of their height, then capped with glorious snow and denser clouds and such lights and shadows as, I suppose, no one could paint or kodak. Then over a rustic bridge without a railing of any kind over this rippling "slew," into an orchard of Apple, Plum, and other fruit trees, all well trimmed and neat. Thirty porkers came grunting towards me, needing no flattery or explanation, for there could be nothing better at the Islington show, and they are "registered," too, as thoroughbreds. I found the farmer, who is a widower, and his old uncle resting a bit

before dinner at twelve o'clock, for the churning of a huge lot of butter had just been completed, and the uncle was preparing the meal. I had to see the pedigree Ayrshires, the horses, and the splendid new barn, bigger than many a church, and I had to listen to a tale of early Cariboo days. "Cariboo days" correspond with English ideas of "Norman or Saxon days"; for the uncle was a Cariboo miner in 1857.

I remarked what a fine man and how handsome Lord Kitchenner was; his portrait hung on the wall, as it does in many a Canadian home.

"Yes," said the old fellow, "he reminds me of Sir Matthew Begbie" (Chief Justice in Cariboo days).

I said Sir Matthew ought to have been in the Transvaal ten years ago; how well he kept the rowdy American element down in British Columbia.

"Yes," said the old miner, "I remember."

On one of the Judge's tours he rested his horses and himself in a well-grassed district, and while he rested he fished; he laid a fine trout on the bank and went further up the stream for more.

A Yankee came along and cut up the beautiful trout for bait and went a-fishing, too. When the Judge came back he inquired who had cut up his trout. "I did," said the bullying teamster or poacher. "Then you are no gentleman," said the Judge. "I will give you a thrashing," said the bully. "if you dare say that to me." Said the Judge ("he being well scienced," said the old miner). "Sir, I can oblige you if you want to fight, and I repeat you are no gentleman to have cut up my trout in this way." Upon which the offender fell upon him. As the Judge punished him very severely with his fists, the brute took to kicking, but the Judge held him off and made him sue for mercy.

This was only another little feather in his cap, for every law-loving miner and teamster respected Judge Begbie, the right man in the right place, and he often thought his right place was in the midst of the roughest and most dangerous characters. With his cook, his mule, and his horses, he went to carry out the law, and he did it without flinching.

Monthly Rose Field Marshal.

Revolvers or bowie-knives were regarded with detestation by him.

The squirrels, the woodpeckers, and the magpies chattered in the hazel and birch trees, the frequent report of the blasting that the railroad men and stump clearers were carrying on, and the ordinary farm sounds reminded me on my way home that it was springtime, and that thousands besides myself might make a beginning in this lovely land and found homes, possess farms, enjoy magnificent scenery, and never be "out of work." And so I sat me down and tried to tell the perplexed home seeker in far away England what I saw on a spring day in British Columbia.—("The Outlook.")

## Fern Fronds.

When we consider the practical identity of purpose of the Fern frond, viz., to bear the spores which are necessary to reproduction, and by that interaction between leaf and root, common to all plants, to propagate the individual plants by offsets, we can hardly fail to be amazed at the marvellous diversity of form which has been evolved. In size alone, the extremes extend from small, almost grass-like, plants—*Asplenium septentrionale* to wit—to tree-like growths which rival the Palms and bear circlets of fronds many feet in length, such as the *Dicksonias*.

It is, however, in the direction of diversity of cutting and make that wonder is mainly felt. In one direction, namely, that of mere division and subdivision, we have Ferns like the native Hart's-tongue and various exotics which are simply strap-shaped, without any tendency to division at all. Next we have the *once divided* ones, like the common *Polypody*, which may be roughly compared to a double broad-toothed comb, tapered to a blunt point; or, in another family (the Shield Ferns) we have the Holly Fern with a row of undivided prickly Holly-like pinnae set on each side of a midrib. In its relatives, the soft and hard Shield Ferns, the frond consists of a double row of pinnae, each of which is divided like a Holly Fern frond, i.e., bipinnate; while in the Lady Fern we get even in the normal growth a still further division, i.e., tripinnate with the ultimate division saw-toothed, indicating a step towards further division. A very large number of Ferns, embracing all the Tree Ferns, build up their broad spreading fronds on these fundamentally simple lines of division and redivision, the extent depending largely on relative freedom of growth.

A further study of this divisional system will show that as a rule the same plan prevails throughout, i.e., the inner divisions are replicas of the entire frond, just as small crystals are built up on the same plan as larger ones. In watching, indeed, the development of a Fern frond, especially the angles assumed by the veins, the idea of vegetable crystallisation is strongly borne in upon the mind, certain geometrical laws being as closely followed in the one case as in the other. Outside, however, of this general mode of construction, we find on the one hand such curiosities as the *Platycerium* or Elk-horn Ferns, and the *Adiantums*, the former characterised by huge, leathery, forked fertile fronds, and almost circular barren ones, and the latter, by having the minor divisions shaped variously, but usually like fans, and attached to shining black stalks. How much variation may be infused into this plan is seen by comparing the lovely *Adiantum farleyense* with *A. cuneatum gracillimum*; or, lower down in the scale, with *A. reniforme*. On the one hand there are huge, pendulous masses of delicate plumage with fringed divisions an inch across, and on the other a more or less dense mass of tiny divisions on a little stiff growing plant, each frond a mere stalked Fern a few inches high.

Despite, however, the wonderful diversity which Nature has managed to introduce in this way with the normal or specific types, she is by no means content therewith, and has invented, and indeed is constantly inventing, variations upon them in the form of "sports," some of which differ by going a step or steps farther in the direction of finer cutting, associated it may be with additional leafiness, to others she attaches more or less ornate tassels to all the tips; varying this again by the extent to which she carries out the idea; while in other cases she varies the make and shape of the parts in infinite ways, altering the habits of the plants concerned into gigantic or dwarf types, or on more eccentric lines. In this peculiar faculty, the Fern frond, as distinct from the leaf of the flowering plant, "sports" to a far greater extent, the former assuming eccentricities which are never seen in the latter. The only flowering plant which has tasselled leaves is a crested form of *Asparagus plumosus*, and even in this, the tasselling is associated with foliage almost identical in type with Fern frondage; while a very large number of Fern species have yielded tasselled forms, and some a greater number.

Perhaps, however, the most curious fact connected with the

Fern frond, the association of which into a Fern plant constitutes the entire popular conception of a Fern as a Fern, is that Ferns might exist without them, since all their vital functions of existence, including reproduction, may take place on a microscopic scale in a phase of existence which precedes the appearance of fronds. During this phase the Fern exists in the shape of a tiny, flattish green disc, attached to the soil by root hairs, and rarely more than a quarter of an inch across. On the under side of this disc, called the "prothallus," the equivalent of male and female flowers bud out from its surface, and in the normal course, produce between them a fertilised seed, from which the frond-bearing Fern subsequently springs. This almost invariably happens, but it has been found that spores may be produced on this disc itself, and it is only necessary to assume that these spores would again produce spore-bearing discs to see that fronds need never appear; existence would continue from generation to generation as a mere green coating to the soil, like a small Liverwort, and all the myriad lovely forms with which we are familiar in the Fern world would be non-existent.

The frond, however, is a great aid to the Fern plants by presenting an infinitely larger area for spore production, associated with a better chance of these spreading by wind or other agencies. The attendant formation of deeply penetrating roots in lieu of the purely superficial root hairs of the prothallus, afford also a much greater range of environment. Every Fern, it is true, must pass through the small disc stage at the outset, but a short rainy period would enable it to establish itself as a frond and root bearer, and thus survive a subsequent drought which would inevitably shrivel and kill the disc. The advantage afforded by the fronds and roots is therefore manifest, and the acquisition and development of these have, doubtless, been the evolutionary factors which have lifted the Ferns so far above their lowly cousins the Liverworts, in the scale of plant-life, while their diversity has to a certain extent been the outcome of adaptation to various environments, plus determining forces in the sportive direction, which as yet completely baffle the biologist's research so far as the cause is concerned or any law regulating their appearance.—CHAS. T. DRURY, F.L.S., V.M.H.

## Melons at Barford Hill, Warwick.

During a season like the present, when these showy fruits are in many instances unsatisfactory, and when complaints about canker in the stems and rotting in the fruits are numerous, it is pleasant to record a distinct cultural success. During a recent visit to Mr. R. Jones, the well-known gardener to C. A. Smith-Ryland, Esq., I was greatly impressed with a splendid crop growing in a span-roofed structure. The plants were arranged 2ft apart and they only extended up the roof a distance of 4ft or 5ft, yet in no case did I notice less than four Melons on a plant. In one instance I counted six, and in several five. All these were fruits which had swelled simultaneously, and were netting beautifully. Experienced cultivators know that it is not an easy matter to get so many fruits per plant to swell satisfactorily at the same time. The varieties were Lockinge and Frogmore Scarlet. During the recent dull weather Mr. Jones has not been sparing with fire heat, and no doubt to some extent this explains the freedom of the plants from canker or decay. During seasons like the present we should hear far fewer complaints about mysterious diseases among both Melons and Cucumbers, if cultivators generally would use more fire heat, as a low temperature and too moist an atmosphere bring ruin to thousands of plants.

The use of suitable soil is another point which requires more attention than it often gets. During dull weather the roots of plants necessarily get somewhat sluggish, even when surrounded by congenial conditions in regard to soil and temperature, and when the soil is too close in texture root action is still further lessened, even if decay—with its inevitable result, disease and collapse—does not set in. At Barford Hill, after a good deal of searching, good soil has been obtained, nice brown turfy loam, "springy" to the touch and full of fibre. This is packed firmly on the hard bottom which forms the raised bed, nothing is added to the soil, and white active roots quickly find their way to the edges of the turf. When the fruits begin to swell, top-dressings of chemical manures are given, stopping and tying of course regularly attended to, so as to keep the reserved shoots and leaves thinly disposed, and at the same time to have a little young growth constantly going on. In an early house where the crop was cut some time ago, a second batch of fruits were swelling rapidly on the old plants, which were as healthy and vigorous as one could wish.—H. D.

### The Great Sequoias.

I notice your reference, in recent issue, of probable injury to some of California's "big trees" (Sequoias, or Washingtonias, or Wellingtonias) through fire. I am happy to report that the U.S. troops stationed at Wawona were able to check the fire before it reached the Sequoia Grove. This is the Tuolumne Grove (pronounced Tu-o-lum-ne), with which I am very familiar. I took the measurements of one of these trees with a ball of twine, and found on reaching home that the diameter of the tree exceeded the outside lines of a tennis court. This gives one a good idea of the immensity of these trees; a few groups of a hundred or two standing among the forest of Cedar and Pine which extend for hundreds of miles north and south, and nearly forty miles in width. Unfortunately the fires which annually occur destroy thousands of acres, and the axe of the lumberman cares naught for the morrow.—LEONARD COATES, Napa, California.

### The Effects of Frost.

When last spring there appeared an article from my pen in the *Journal of Horticulture*, entitled "The Season of Blossom," I was in a hopeful mood, because just about that time prospects were indeed fair. The weather had been cold, and the season was backward; but gardens looked promising, and fruit growers were particularly sanguine. Indeed, they had reasons to be just then, for the country all about was a sheet of living bloom, and the question of heavy fruit crops was hopefully discussed. But before my notes appeared in print something happened which necessitated the insertion of an editorial foot-note. It was a series of light frosts and one heavy one, when the thermometer in my garden indicated 10deg, and since then the aspect of affairs changed considerably, and, unfortunately, for the worst.

My first impulse on that memorable morning (I need not trouble about the date, as most gardeners have good reasons for knowing it) was to walk through the garden. I had been there the night before, and had congratulated myself that, so far, a promising patch of early Potatoes had escaped; but 10deg of frost was too much for them. The tops were covered with a thin silver crusting, that quickly vanished under the influence of the sunshine, and left nothing but black ruined growths. They subsequently started again, but they merely presented a number of thin weakly shoots instead of one healthy growth, and this I knew meant a late and light crop. A neighbour who had looked somewhat enviously at those early Potatoes came round to see the damage, and sympathised with me in a most comforting, but human manner. "You shouldn't have been in such a hurry," he said. "I'm glad to say mine aren't through the ground." Only two days before he was excusing himself for being late with his Potatoes.

But I was not the only sufferer, and my loss has been nothing compared to that of some of my neighbours. During the day a market gardener called, a hard working man, who makes a living, but is not growing rich, on a few acres of land. "Three acres of Potatoes clean spoiled," that was his dismal story, so far as one crop was concerned, but his troubles did not end there. He has a plantation of Gooseberries and Currants, from which he was hopeful of reaping a nice little return, as the bushes were heavily laden with fruit. He was trusting that the foliage would protect the berries, and at first they seemed all right; but later on the effect of the frost could be fully seen. The ground beneath was strewn with black and shrivelled fruits, and comparatively few remained on the branches above. Amateurs and private gardeners fancied that they had been hard hit; but it is the men of the market-gardening class, who look to early crops for a living, that have had the greatest reason for deploring that deadly frost.

"I don't know what to make of it," said a working fruit-grower to me in those days, as he cast an anxious glance round his orchard. "We had such a show of bloom that if three-parts of it goes there will still be a crop; but I am not very hopeful." In company we walked amongst the trees. The white petals had all flickered from the Plum trees, but instead of plump little green fruit remaining, they were mostly black, shrivelled, and falling. "I doubt it's over with the early Cherries," continued the grower, and in his case it was a certainty, for an examination displayed the same sad state of

affairs as in the case of the Plums. In the case of Apples there did not seem to be the same cause for anxiety. Many trees were in bloom when the frost came, the changing of the bright pink of the flowers quickly to a dull brown being not a good sign, and in many places the frost very visibly left its mark. The bloom, however, was exceptionally thick, so to that we owe the present average crop, and also to the fact that the later flowering varieties were not out fully when the frost came, and the weather subsequently grew more genial.—RUSTICUS.

### Overtime.

The subject of overtime will not fail to interest the young men in the bothy, particularly if they happen to be doing a few hours every evening now without any addition to the stipend on Saturday night. From the views put forward by "R. P.," the average gardener must be something of a natural overtime working animal, possessing an inherited tendency for this from his parents. I don't say that it is so, but I have known gardeners of this order, and have made one of the luckless bothy staff who were expected to put in an extra hour or two when the days were long enough, quite as a matter of course. There are times when overtime is necessary in most gardens—in the Grape thinning season, for instance—but except on such occasions I quite agree with "R. P." that a good deal of it could be dispensed with if a better method of arrangement was in force; but then, as your correspondent remarks, it is not easy to change from bad methods to good ones. It is largely a question of moderation; but when a man, be he head or under, has put in from ten to twelve hours in a day he has done enough, as a rule.—H. L.

### The Bothy.

In looking over the back numbers of the *Journal* I find some strongly-worded articles on "The Bothy," a subject teeming with interest, and admirably adapted for the display of passionate declamation, with which some of your correspondents appear superabundantly gifted. Although I emphatically concur in the expediency and necessity of reform, I view with ridicule the suggestion that the bothy system should be wholly abolished. Why condemn the entire system because in practice it shows the need of alteration? Should we reject a machine, correct in principle, accurate in construction, because the presence of rust and absence of oil prevent its harmonious working? Clearly the advocates of such radical measures display an *ignoratio elenchi* and a misconception of the elementary logic of cause and effect. Following their principle to its rational conclusion, we should shoot every broken-winded horse, destroy every foundered engine, and even upset our constitutional form of government, on account of its minor inefficiencies, in favour of a despotic monarchy or the negative principles of anarchism.

These, however, are deductions from which common-sense recoils. Thus one correspondent applies to the bothy the epithet of "moral nuisance," regarding it as the foreign ground of corruption, and a hotbed of all the vices which can be committed by a systematic and categorical breaking of the ten precepts. Truly, "he that saith this hath o'erstept the slippery footing of his narrow wit and fall'n away from judgment." Our worthiest men, whom we look upon as models, horticulturally and socially, have been trained in bothies, and the well-nigh unanimous voice of gardeners, young and old, proclaim that to dispense with the bothy is neither practicable nor desirable. Moreover, the strong argument of mutual convenience and economy to employer and employed precludes the probability of such a fanatic howl emanating from an effeminate minority ever being afforded serious attention. It may be regarded as an almost infallible rule that those who condemn the bothy system are, in the plenitude of their effeminacy and pedantic refinement, characteristically unsuited for such a life; for it cannot be controverted that bothy life is eminently fitted for the early development of that manly and independent spirit so conspicuous in the English—or, rather, I should say, considering my geographic position, British—character. Still, on the need of reform, nearly all seem agreed, and the sooner it can be brought about the better. The ventilation of the grievance, as at present, in a high-class journal, cannot fail to be prolific of good; but some minds are so encrusted with a rusty conservatism, and so filled with an irrational dread of change, that time alone can bring about any alteration.

It is the height of absurdity to suppose that an ideal bothy is necessarily utopian. Such is by no means the case. If it be admitted as proved that a badly organised bothy engenders a devil-may-care spirit and a sublime indifference to his own progress in the young gardener, it may clearly be adduced as a corollary that a good bothy will tend to promote qualities diametrically opposed to these failings.—WM. ROWLES, Edinburgh.

# NOTES & NOTICES

## Too Much Rhubarb.

The production of Rhubarb in the Lambeth Union Gardens has been so great that 1,180lb had to be thrown away the other day because the paupers had got tired of the stuff, and would eat no more.

## The Royal Botanic Society.

The sixty-third annual meeting of the Royal Botanic Society was held on Monday last. The report stated that the list of Fellows had now increased to 2,136. There had also been an increase in the School of Practical Gardening. The expenditure had exceeded the income by £79 9s. The question of raising the subscription was considered, and the report adopted.

## Amateur Gardeners.

The National Amateur Gardeners' Association, Liverpool branch, held their monthly meeting on Thursday last, at the Common Hall, Hackins Hey. Mr. Hitchmough presiding. Mr. Ellison gave a most interesting lecture on amateurs' green-houses. Messrs. Dodd, Paddock, Robins, Ellison, and Hitchmough, Mesdames Stevenson, Macgregor, Harris, Thomas, Morris, and Paddock were the prize winners. Messrs. Dobson, Howard, and Morris acted as judges for the evening's exhibits.

## Sunken Trees.

The laying of new gas mains in Finsbury Pavement has been the cause of an interesting discovery in the shape of old trunks of trees which were in old time laid as water conduits. Finsbury Pavement is on the northern edge of the City at Moogate Street, and the conduits were found barely 4ft below the surface. The trunks proved to be in a wonderful state of preservation. They had been hollowed out to a bore of 6in or 8in, the trees in some cases being from 4ft to 6ft in girth. One end of each length had been pointed to fit into the hollow of the next, some of the trees being 20ft or more in length. There is an opinion that they must have been 150 years in the ground.

## Schedule of the Fruit Show at the Crystal Palace.

From this, intending exhibitors learn that by giving the R.H.S. three days notice, they can get their exhibits unpacked and staged if sent before September 18, but to their removal and return they must attend themselves. The only vegetables exhibited will be Tomatoes and Cucumbers. Fruit and Flowers are not to be combined in one exhibit. Groups of decorative plants and flowers will receive no awards. Care should be taken that each fruit retains all its natural bloom. None may be polished. Errors in naming do not absolutely disqualify. Each dish must contain only one variety. All fruit for prizes must have been grown in the British Isles. "Grown in the open air" means that the trees have both flowered and "set" their fruit out of doors.

## Royal Horticultural Society of Aberdeen.

The arrangements for the annual flower show under the auspices of the Royal Horticultural Society of Aberdeen, which takes place this month in the Central Park, Kittybrewster, which the society has not visited since 1892, have now been completed by the secretary, Mr. J. B. Rennet, advocate, and given good weather, the exhibition promises to be in every way a conspicuous success. The show is, as formerly, to extend over three days, namely, Thursday, Friday, and Saturday, 21st, 22nd, and 23rd inst., and besides the exhibition of flowers, fruit and vegetables, the society will have as an additional attraction the band of the 1st Aberdeenshire R.G.A. (V.), under Bandmaster Wood, and the Oakbank Boy Pipers, while in another part of the park White's carnival will be in full swing during the three days of the show. A new departure this year, suggested to the directors by the facilities afforded for such an event by the Central Park, will be the holding of pony races, donkey races, and a competition for the best pony turnout. The opening ceremony will be performed by Lord Aberdeen, under the presidency of Sir Allan Mackenzie, Bart., of Glenmuick, chairman of the directors.

## Planting a Coronation Oak.

On Monday, an Oak tree, graciously given by the King, was planted in the public part of the Home Park of Windsor Castle by Mrs. Mitchell, the Mayoress, to commemorate the Coronation. The Mayor and Mayoress afterwards held a reception at the Guildhall.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. Thos. Winter in the chair. After the minutes of the last meeting were read and signed, four new members were elected and one nominated. Five members were reported on the sick fund, and two others had been on and off the fund since the last meeting. The secretary was instructed to make the preliminary arrangements for the annual dinner, to be held early in October next.

## The Late Mr. William Miller.

After a long and painful illness, the death occurred on Saturday of Mr. William Miller, of Speen. He succeeded his father many years ago in business as a nurseryman and florist, and was widely known in the district. On many occasions he officiated as a judge at the annual exhibitions of the Newbury Horticultural Society, and at this year's show sympathetic reference was made to his long connection with the Society. The funeral took place at Speen churchyard on Wednesday. The Horticultural Society was represented by the hon. secretary (Mr. C. H. Stradling) and his assistant (Mr. J. W. H. Kemp), and a wreath was sent by the committee.

## Kirkbean and District Show.

This local show, held at Carsethorn, Kirkcudbrightshire, on August 7, was the most successful of the series since the formation of the society five years ago. The horticultural entries were rather larger than last year, and the cut flowers were remarkably good for the earliness of the date, and the backward character of the season. A splendid feature was the table of pot plants and cut flowers sent by Mr. Houlsiton, gardener to Colonel Blackett, of Arbigland. It was superior to anything he has previously shown, and was deservedly awarded an illuminated certificate and a medal by the judges. Mr. S. Arnott, one of the joint secretaries, was also awarded a certificate for new, rare, and remarkable herbaceous plants. In the horticultural department the most successful exhibitor was Mr. R. A. Austin, Mainsriddle; the other leading exhibitors being Mr. J. Briggs, Preston Mill, Dumfries; Mr. Robson, Chapelgrove; Mr. Joseph Robson, North Carse; and Mr. R. Major. The principal prizes were handed over by Sir M. J. Mount Stewart, Bart., M.P., who made an interesting little speech.—A.

## Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, August 19, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 p.m. A lecture on "Horticultural Education and Teaching in England" will be given by Mr. W. H. Patterson, F.R.H.S., at 3 o'clock. At a general meeting of the Royal Horticultural Society, held on Tuesday, August 5, eleven new Fellows were elected, making a total of 870 elected since the beginning of the present year. The Royal Horticultural Society will hold a special exhibition of Dahlias on September 2 and 3 in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, S.W. At this meeting only Dahlias can be shown—with the exception of flowers, fruits, &c. for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 5 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes see "R.H.S. Book of Arrangements for 1902," pages 91 to 93, or separate schedules can be obtained on application to either Mr. J. F. Hudson, M.A., Gunnersbury House Gardens, Acton; or to Mr. C. E. Wilkins, 19, Lyndhurst Road, S.E., joint secretaries to the National Dahlia Society. Intending exhibitors at the Crystal Palace Fruit Show on September 18, 19, and 20, can obtain an official entry form, together with schedule, on application to the Secretary, R.H.S.; 117, Victoria Street, S.W. (a penny stamp should be enclosed). Entries for this show close on September 11.

**An Aloe in Flower.**

In one of the enclosures in Parliament Hill Fields, near Highgate Road, there is now to be seen an Aloe in full bloom, and the rare sight attracts a considerable amount of attention. In this country, even in greenhouses, the Aloe does not flower until it reaches an advanced age, whence arises the gardeners' fable of its flowering only once in a hundred years.

**Cider as a Drink.**

It appears that there are ciders and eiders. Some are free from acid and sugar, and being of a low specific gravity are suitable for gouty people, and are adapted for everybody. The other class of ciders, sweet in character, are not at all beneficial or healthful. "Rough eider" is the beverage to be commended. The sweetened eiders and those termed "champagne" brands should be avoided.

**Newabbey, N.B.**

This energetic society was not so well supported as usual in the way of entries, and, consequently, their show on August 9 was not so attractive as usual. The leading feature of the show was the pot plants, the Begonias and Petunias being the best. In the open class, Mr. W. Carruthers, Shambellie Gardens, had it practically all his own way with cut flowers, his hardy flowers being especially good. His Begonias were the finest he has yet shown here. Miss Wilson, Newabbey Manse; Mr. E. McCurrach, the Schoolhouse; and Mr. W. Bell and Mr. J. Waugh, Newabbey, were among the other leading prizetakers. The vegetables were good for the season.

**Tea Under Cultivation**

In India and Ceylon at recent periods, together with the crops produced, based on official records. In 1890 there were 344,800 acres under cultivation in India and 250,000 acres in Ceylon, India producing 112 million pounds of Tea, and Ceylon 47 million pounds, the total crop being 159 million. In 1895, with a cultivation in India of 415,700 acres and in Ceylon of 305,009 acres, the respective crops were 143 and 93 million pounds, total 241 million pounds. In 1900 the cultivation was in India 522,000, and in Ceylon 384,000 acres, producing 197 and 148 million pounds of Tea respectively, or a total of 345 million pounds. The average annual increase in the Indian crop for the last ten years has been  $8\frac{1}{2}$  million pounds, and in that of Ceylon 10 million pounds. The home consumption for British-grown Tea for the last calendar year—1901—was 238 $\frac{3}{4}$  million pounds; the consumption in foreign markets and ship stores 95 $\frac{3}{4}$  million pounds, making together 334 $\frac{1}{2}$  million pounds.

**Echoes from Hamilton.**

Yet another month of few redeeming points has passed away from the stage of time which brings us now face to face with the realities of autumn, and still but little prospects of the summer. As we write (7th) the elements are as uncongenial as well could be, without the actual presence of frost or snow. The last two days have been phenomenal August weather. On both the clouds were exceedingly angry and surcharged with moisture. This scene was intensified by a sweeping semi-gale of east wind, all very unlike the ideal month of August. This has been much the nature of our weather throughout in these north-western climes, with the result that most things have suffered considerably. Strawberries and small fruits are both late and poor. Apples, Pears, and Plums are not only scarce, but the quality is indifferent. Lord Suffields and Stirling Castles have scarce reached the size of fairly grown Walnuts! and forcibly remind one of the samples one sees from an Areadian garden. Vegetables generally are good, though a trifle later mayhap than usual. Hay crops are heavier, and altogether better than were at one time anticipated. Cereal crops, too, are heavier, but still quite green. Grazing is good, and has pulled up immensely, though long in moving in the earlier part of the season. Farmers and gardeners, on the whole, are, notwithstanding the general backwardness of things, fairly contented. In the department of the forester there also appears to be little calling for serious grumbling. Young plantations are making wonderful growths. We measured young Norway Spruce growths over 18in, and Rhododendrons, which is not probably so good, are making incredible growths, too much to guarantee abundant bloom next year.—D. C.

**The Scottish Summer.**

The enervated Southerner, who is now languishing under the debilitating breezes of the North Foreland, will be pleased to hear that his Scottish brethren in the neighbourhood of Hawick have been enjoying 5deg of frost.

**Correction.**

We are requested to state that in our report of Leicester Show we described Mr. Amos Perry, who won a Gold Medal, wrongly as of Tottenham, and not as of Winchmore Hill, with which latter place he is now identified.

**The Hamilton Horticultural Association.**

At the monthly meeting of the Hamilton Horticultural Association, Mr. MacMillan, head gardener, the "Orchard," Hamilton, read selections from the *Journal of Horticulture*, which were very much appreciated, and for which he was accorded the cordial thanks of the meeting. The president, Rev. Mr. Paterson, was in the chair.—D. C.

**College of Agriculture, Downton, Salisbury.**

The twenty-second summer session of this college ended on Friday with the usual distribution of certificates and prizes. Professor Wrightson presided, and in his address spoke of the connection between Nature-study and agriculture, especially as regarded trees (forestry), grasses, animals, both useful and predatory, insect attacks, and weeds. He also commented on the attention of their American and Australian students. The following is a list of the prizemen:—The Bles Scholarship of £10, given to the best man who has completed one year, F. G. Bateman, of Somerset Road, Ealing, W. The diploma, given to two years' residents who pass in all subjects taught at the college, J. C. Thompson, of Knighton House, Leicester; A. J. H. Wrightson, of the College of Agriculture, Downton; F. R. Kelly, of Ballantlea Park, co. Clare, Ireland; N. D. Stewart, of Bryntirion, Vaynol Park, Port Dinorwie, North Wales; and C. Crowley, of Banghurst Rectory, Basingstoke.

**July Weather at Belvoir Castle.**

The prevailing direction of the wind was W.; total eleven days. The total rainfall was 1.24in, this fell on eleven days, and is 1.58in below the average for the month; the greatest daily fall was 0.28in on the 25th. Barometer (corrected and reduced: highest reading 30.302in on the 2nd at 9 p.m.; lowest reading 29.305in on the 26th at 9 p.m. Thermometers: highest in the shade, 81deg on the 14th; lowest, 39deg on the 25th; mean of daily maxima, 66.93deg; mean of daily minima, 49.83deg; mean temperature of the month, 58.33deg; lowest on the grass, 35deg on the 25th; highest in the sun, 131deg on the 16th; mean temperature of the earth at 3ft, 57.96deg. Total sunshine, 162 hours 30 minutes; which is 30 hours 12 minutes below the average for the month; there were two sunless days. The mean temperatures are the lowest we have had in July for several years.—W. H. DIVERS.

**Meteorological Observations at Chiswick.**

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

| Date.            | Direction of Wind. | Temperature of the Air. |           |           |           | Rain.       | Temperature of the Soil.<br>At 9 A.M. |                |                | Lowest Temperature on Grass. |

The weather during the past week has been dull and cold; rain fell every day, and was very heavy on the afternoon of the 6th.

## The Petunia.

The Petunia is a general favourite with horticulturists of moderate ambition and limited resources, and figures prominently at this season in every garden. The name petun is the Peruvian for tobacco, there being a close connection between the Petunia and the Nicotiana. Though now so popular, the introduction of the Petunia is of recent date compared with that of many flowers having a much more limited diffusion. It will scarcely occur to admirers of this thoroughly naturalised flower that it is a native of the Pampas of Buenos Ayres, and that its presence in England was unknown within the memory of a few persons now living, it having been introduced seventy years ago.

One peculiarity possessed by the ordinary known florists' varieties is the facility with which they develop seeds, varying in character from that of the parent plant, and giving origin to a considerable complexity of markings as may be seen by referring to our illustration. Both double and semi-double varieties are there represented. The best forms, though originally raised from seeds, are perpetuated by cuttings of young flowerless shoots in a close warm case or frame in early autumn or spring; but beautiful varieties for garden and greenhouse decoration are obtainable from packets of seed from a good strain, such as supplied by Messrs. Barr, Sutton and Sons with others. Excellent plants are raised by sowing thinly in fine soil in pots or boxes in August, the soil to be kept uniformly moist, and the seedlings transplanted as soon as possible in other pots or boxes to become sturdy before the winter, through which they will pass safely on a shelf suspended from the roof of a frost-proof greenhouse. Plants are also easily raised by sowing in a warm frame in the spring.

## Insects as Garden Adornments.

It is but a word of three letters, one of the briefest our language contains, yet "fly" means a great deal that is very unpleasant to the gardener. Apart from its designation of those insects, the entomologist considers the flies proper, it is given to sundry members of the aphid group, justly regarded as amongst the most formidable enemies to horticulture, and which must be kept in check by constant watchfulness. Many flies do mischief to flowers and fruit when in the winged state; others, in the larval condition, are even more persistent, inflicting damage on roots, stems, and leaves which is often undetected till too late.

Still we have a set off; some species of flies are useful scavengers, and others of predatory habit kill various insects that we are glad to see diminished in numbers without exertions on our part. Then there are flies, frequenters of gardens, whose tints in the summer sunshine are really beautiful, their adornment and their rapid flight imparting animation to the scene as they regale themselves upon the flowers.

Though we must grant the noise several species make is not agreeable on a hot day, their sonorous buzzing is indicative, we may presume, of the satisfaction they find in their brief winged life, for it is possible to discriminate amongst insect hums or buzzes—notes of pleasure, of anger, and of alarm. Flies of noisy habit that are occasionally seen in gardens are the breeze flies, one of which was brought me the other day as a curiosity. They are showily marked in black, yellow, and grey, having wings with many nervures, and a long proboscis, applicable for blood sucking, in the female insect certainly, hence their loud buzzing is a warning to look out; but the male flies are mostly satisfied with the juices of flowers. These breeze flies are Tabani, dreaded by cattle on pastures, also by horses. The eggs are dropped, it is thought, amongst the herbage, and the young grubs burrow in the soil, living upon roots. Better known to the gardener is the common chameleon fly, akin to these, named from its diverse colours, and a useful species, since it preys upon other insects, some of them being garden pests. *Stratiomys chamæleon* has a broad body, long antennæ, a spiny thorax, the ground colour black, spotted and streaked with red, yellow, and white. In its juvenile stage this insect leads an aquatic life, the grub floating along shallow streams, breathing by means of a telescopic tail.

This species is a good example of the family of soldier flies, presumably named rather from their red markings than because of their warlike habits; though some, like the chameleon fly, attack smaller insects they meet with at flowers, while also partaking now and then of their juices. Several of the larvæ or grubs feed on decaying substances, and are therefore of service to us. In the genus *Sargus*, the flies are slim bodied and of beautiful metallic hues. About this time *S. cuprarius* is on the wing where flowers are plentiful; it has a golden green head, and the body is lustrous purple. They are not particularly pretty, but from their habit of haunting flowers, upon which they walk in a sluggish way, we cannot help noticing the *Acroceras*. These little flies have a curiously swollen body, and a head so tiny that it seems only just to hold the eyes and the short antennæ.

It is unfortunate that few of the familiar flies have received English names, and we cannot find one for our friends in the genus *Asilus*. Strong winged, muscular flies these, abundant in woods and along roads, making an occasional excursion into gardens for variety of prey. Nothing comes amiss to a hungry *Asilus*, as one of them will attack a relative, and despite its being armed with a sting, an *Asilus* can conquer a bee. Mr. Staveley has often noticed such a fly carrying a bee larger than itself. Surely, he remarks, he must be going to a picnic, or why should he not at once dine upon what he has got! Somebody else remarked that these flies have a hungry look; they are long bodied, often hairy.

One common species, *A. crabroniformis*, seems to have taken its name from a slight resemblance in aspect to a hornet. It is a handsome fly, clothed with deep golden hairs all over, except a part of the abdomen, which is velvety black, the wings rich brown, showing a few darker patches. It is reported to be a great destroyer of caterpillars, sucking their juices. The larvæ of *Asilus* live underground, or in decaying wood. We associate with these flies the smaller species of the genus *Empis*, sometimes called snipe flies; their legs are long, and the tongue is like a bird's beak. They are useful to us, as preying upon crane flies and other troublesome species; some of them during the summer clear off thousands of the leaf-roller moths, whose caterpillars disfigure many garden trees and shrubs. Towards evening the snipe flies may be observed flying in parties, most of which are rather dull coloured, and they are not particularly vocal.

Pass we now to other notable garden flies, which have often been mistaken for bees, or even for one of the bee-like hawk moths, as was instanced by sundry notes upon some specimens that were published during the spring in this Journal. Indeed, several of the bee flies do resemble the humming bird moth, since they hover about a flower without settling, the long proboscis being used to extract the honey. Again, they dart off suddenly while suspended in the air, and you can scarcely tell to which direction, they having moved so swiftly. A bee fly, even in repose, keeps the wings at full stretch; the antennæ is long and slender, as well as the proboscis, and in habit they are pacific, leaving other insects alone.

We have a good example of the family in *Bombylius major*, the fiery garb seeming to suit its appearance before the summer heat has arrived. Its black body is adorned with golden hairs above, and beneath they are black and white, the broad body being topped by a small head. Allied to the bee flies is a rather remarkable species, called *Anthrax sinuata*; it has a short proboscis, is less hairy, and owns ample wings. This, too, is a flower lover, it often frequenting the Hawthorn and the Honeysuckle. It is not brightly coloured; but, as a French naturalist says, the appearance of the fly resting on a flower is a pleasant contrast to the eye, caused by the velvety black body and the variegated wings, upon which black and white are well defined.

Again, in the large family of the *Syrphidæ* we have flies which neither as a group or as individuals can claim popular names. Yet they are familiar objects about the garden, some large, some small, we see them from spring to the close of autumn. Most of them have a head which seems all face, being flat behind, the tongue large, usually bent in the middle when the insect rests. Many exhibit metallic heads, with black and yellow bodies, but there is great diversity of colour, some are sombre grey, most having some tints of yellow, red, or white. Several species hover curiously above flowers, undulating from side to side. All of them are lively flies, their wings glancing in the sunshine adding to the brightness of the day, nor is their musical hum at all disagreeable. While grubs, those in the genus *Syrphus* are diligent destroyers of the aphid, others feed upon decaying roots and dung, and a few live parasites in the nests of bumble bees.

Then we have about gardens hosts of tiny flies, which may sometimes tickle our faces, but are both pretty and active. For example, the abundant *Cecidomyzæ*, having wings of rainbow tints and mostly long antennæ, occur upon plants of every kind. —ENTOMOLOGIST.

PETUNIAS.

#### **Chrysanthemum Christmas Glory.**

This is the name of a new variety raised by Mr. Dyer, Frimley, and is likely to be useful as a late one for the supply of cut flowers. The colour is crimson, and it keeps the tint well. It has a good stem and a dwarf habit of growth. The blooms are of medium size, and the form elegant. It is difficult at this time of the year to obtain Chrysanthemums of bright colour; any novelty to supply that want is therefore welcome.

#### **Chrysanthemum Mons Freeman.**

This variety is another instance of a good thing being discarded before its real qualities are known. At least, it is now useless as a show kind, because small for present day requirements. Ten years ago blooms of it looked well on the stands, but as a late flowering variety with pink blossoms it is first-rate. The formation of the flower is excellent, and the colour very bright and pleasing. Add to this a dwarf, free-branching habit of growth, with a stem stout enough to hold the bloom in position, whether a central blossom or a side one. We are apt to rush after novelties in flowers when oftentimes the material is already at hand to grow for a special purpose, and this kind can be recommended as a late pink.

#### **Chrysanthemum Matthew Hodgson**

Is becoming a popular variety for late flowering. It is excellent for the purpose. The blooms have the necessary qualities as form, which is the Japanese; and they always come double; however many are allowed to develop. The stiff stem is not the least of its merits. In colour the shade is terra-cotta of a crimson hue, and this keeps bright to the last. The habit of the plant is first-rate, dwarf, sturdy, and with abundant foliage. Those who grow for market, as well as gardeners in private establishments, should make this one of the principal varieties for the growth of late cut flowers. The plant lifts well, which to the former class of cultivators is an item of importance; and the thick, leathery leaves are more free than most kinds from the attacks of "rust." This variety did not last many seasons as a sort for exhibitions, because wanting in size for that purpose; hence many have discarded a really good thing.—H. S.

#### **Japanese Varieties.**

During the course of the last winter session at a crowded meeting of the Dulwich Chrysanthemum Society, Mr. Taylor, gardener at Tewkesbury Lodge, completed the paper on Chrysanthemum growing, which he had previously brought up to the stage of placing the plants in their summer quarters. Time pressing, he confined his remarks to the Japanese section. His regulations were to keep the plants syringed overhead until the end of August, after which, the night dews will probably be sufficient; tie out shoots carefully, but not too tightly; remove all weeds, and give careful attention to watering, never giving any water unless the pot rings when tapped with the knuckles, always erring on the dry side. About the first week in August a dressing should be given, which should include one part bonemeal in five of soil. Watering with a rose should be done for a time after top-dressing. Before the leaves assume a yellowish appearance, follow with liquid manure from horse droppings and soot of about the colour of pale ale, carefully avoiding any deposit on the soil. This should be followed after a fortnight by a chemical manure, or Peruvian guano, whenever watering is required. The guano is specially useful in wet weather, when it may be sprinkled on the soil instead of being used in the liquid state. Slightly increase the strength of manures as the buds unfold, until they are three parts out, after which, give clear water only. Keep a sharp look out for insects, keeping down aphides by tobacco powder or solution.

Catch and kill earwigs by the use of pots on stakes is not advisable, as they are liable to slip and break shoots. Early morning is the best time to examine the plants for their various enemies. Mildew is sure to appear, and should be checked by dusting with sulphur or by using Molyneux's lime and sulphur solution. Rust is not troubling growers much yet this season.

#### **Taking the Buds.**

Taking the bud is the next consideration, and amateur beginners are recommended to "take" their buds earlier than

they usually do. All buds, with the exception of those of the Vivian and Morel family should be taken by the third or last week in August, and even these should be secured by September 1. To obtain buds in some varieties, it is necessary to pinch in April, thus causing an earlier break, while others, Phœbus for instance, should develop naturally at the right date if struck in January. Mrs. Weekes, Florence Molyneux, and Edith Tabor do well if struck late in March, and the first bud secured. In a large collection recently seen at Brighton, and grown for an exhibition to be held about November 12, bud selection was well in hand at a much earlier date than is usually recommended. Some growers find that the blooms on buds taken late develop too early, but an earlier bud takes so much longer to unfold its many petals, that the remedy is rather in taking early than late.

The next consideration is housing the plants, which should take place about October 1, although consideration of the weather must be shown. The house should be made sweet and clean, and the plants carefully gone over for mildew. For the first week air should be given whenever possible, and the syringe used lightly early in the day if the weather is bright. Fumigate on alternate nights; after this, fumigating once a week will keep down aphides. Other pests should be caught and killed. Slight shading is beneficial when the blooms are unfolding. If it is found that a plant will be too early for the show, remove to a dry dark room and water as little as possible; or the blooms may be cut, the stems stripped of leaves and placed in bottles. Should a plant be backward, keep it in the warmest part of the house.

#### **Cutting Blooms for Exhibition.**

When cutting blooms for the show leave about 18 in stem, and even when placed in their cups leave an inch of stem to enable any necessary dressing to be done at the show. Take care no duplicates appear where distinct varieties are required. Arrange the blooms in a pleasing contrast of colour, say Phœbus against Wm. Steward, and Mrs. G. W. Palmer by the side of Edith Tabor, never putting two of one colour together. When on the exhibition table raise the back row of blooms as high as the cups and tubes will allow. Place the second row just above the bottom florets of the back row, and the same with the front. Adjust the name cards and the class card in their proper places.

Beginners are strongly recommended not to enter too many classes; to send in their entry in good time; carefully follow the directions and regulations in the schedule; set up in good time their exhibits, and to accept in good grace the verdicts of the judges. A good discussion followed, many little difficulties being carefully elucidated by Mr. Taylor.

## **The Cape Town Exhibition.**

The scheme for holding a British and Colonial Exhibition at Cape Town for a period of four months from November, 1903, to February, 1904, is making definite progress. The patronage of Lord Milner has been secured, while the support of other distinguished men and public bodies has been enlisted. The reception accorded to the project is evidenced by the support of the Cape Town Chamber, while similar support, or promises of support, have been received from other Chambers and merchants in the main cities of the several South African colonies. A like cordial reception has, we understand, been met with in this country, and even in our most distant colonies. The Chamber of Commerce and the Town Council of Cape Town, representing the leading merchants and business men at the Cape, are to appoint an Advisory Board, in order to forward the arrangements and interests of manufacturers participating in the exhibition. The site upon which the exhibition is to be held has already been chosen. It adjoins the Botanical Gardens, and is within five minutes' walk of the Town Hall. The contract for the construction of the necessary buildings has also already been signed. The number of applications for space from British and colonial exhibitors is already large, and probably before long the whole of the available space will have been applied for. The time fixed for holding the exhibition is certainly very opportune. The various paralysed industries, and especially those of farming, dairying, wine growing, will then be busy in schemes for a fresh start, and the tangible and visible exhibition of the latest and most up-to-date appliances, tools, mechanism, and machinery, cannot but lead to very extensive and profitable dealings, and the opening of new trade outlets. Following the good example of the Canadian Government in the process of buttressing the Empire with solid colonies, this effort to stimulate development to the South as well as the North may, we hope, be eminently successful.

## Gardening Literature.

The horticultural literature that has served as the source from which I have drawn here is that dating between the years 1826 and 1840. From the advertisements and notes of the editors, or conductors, as they termed themselves, there seems to have been plenty of gardening publications at that time. A few of them I may mention, namely, "The Floricultural Cabinet and Florists' Magazine," "Gardeners' Magazine," "Botanical Register," "Botanical Cabinet," and the "Transactions of the Horticultural Society" (which was not termed Royal in those days). Among these my notes are principally taken from the Horticultural Society's Transactions, the "Gardeners' Magazine," and the "Floricultural Cabinet and Florists' Magazine." The title of the last-named did not give entire satisfaction to its subscribers. One correspondent says: "I do not like your first title. What has a cabinet to do with a flower garden? The second title (the "Florists' Magazine") is preferable. I do hope you will confine it to the latter title." Also he adds: "If your correspondents are too luxuriant, you can easily apply the pruning knife." It would appear that the conductors did not find it necessary to apply the pruning knife very often, as the articles sent in were evidently very short, and if they had pruned them to any extent there would have been very little to print.

The number of subjects dealt with seems to have been limited. Month after month I find the same subjects treated upon. Dahlias, or Georginias, as they were called, was a favourite subject, and the long lists advertised in the various publications must have been a source of profit to the publishers, and also to the growers, judging by the prices asked for some of them. Carnations, Pinks, Ranunculus, and Pansies, &c., were favourite subjects. Also tours through France and Belgium, and visits to some of the notable gardens in England and Scotland, occupy a large space, and, judging by the remarks made by the tourists and printed and spread abroad, must have caused a good deal of heart-burning amongst the gardeners, and also the owners, of these various gardens visited. A spade was called a spade in those days. In all the notices of visit to different gardens (private) that have appeared in recent years, I have never seen anything so outspoken. I have no doubt some of us have been astonished at the reports of places with which we are acquainted; but when it comes to public places or gardens visited, then criticism is more freely indulged in, and some of us get a good mauling at times, as perhaps we deserve.

Dahlias were in those days great favourites. A note says that they were named after a Swedish botanist (Professor Dahl), and must therefore be pronounced dal-ya. The result of one man's observations is that it thrives best in soil of a sandy nature (good news for us). Another says a stiff clayey loam will, to a certainty, produce the finest flowers, though probably not in such abundance. Its propagation is freely discussed, and one point worthy of notice is in striking cuttings, not to cut out the eyes, or buds, in cutting off the leaves at the base of the cuttings, although it will grow and flower equally as well if they are cut out. It has been found that they failed to start into growth the following year.

One man found that peat mould such as Heaths grow in materially tends to the development of stripes or spots in such flowers as possess these properties, mixed with the soil in the bottom of the hole. Great care was taken of the roots at lifting time, leaving plenty of soil on them; and even putting them in sheds on shelves where there are fires to dry them gradually.

The blue *Hydrangea* exercised the minds of many inquirers, and various recipes are given to change the rose colour to a blue. A twenty-fifth part of iron filing in loamy soil would change the colour, but the flowers would not be so large. Another way: In autumn shake off all soil in which they were growing and pot in bog earth, and if a little well decomposed night soil is mixed in the bog earth, is more certain of producing the blue flowers. And even one correspondent said that his late father had a method of producing

yellow flowers by using strong sulphur water, or some other chemical process, but which is not stated.

The decay of Mignonette plants in full flower was the cause of much complaint and also inquiry. But I did not find any satisfactory solution in subsequent notes. They seemed to be successful in growing it in pots, to flower during the months of winter and spring. Here is an original article in full. "Sow the seeds in 48 sized pots, with their bottoms well drained, in a compost of leaf mould, mellow loam, and river sand. Plunge in a frame having them near the glass, and when the plants are about 1in high, thin them out to six or seven in a pot. Give air when not frosty, but keep the lights closed in severe weather. At all times (except when the plants are in bloom) water them with caution. To flower in November and December sow August 12; to flower in January and February sow August 26; to flower in March and April sow September 6." Had the pruning knife been applied to this article, there would certainly not be much of it left.

Chrysanthemums were certainly not so well known and grown by our great grandfathers as now. The following is an article published in June, 1833, by A. H. Haworth, Esq., F.L.S., &c., author of "Synopsis Plantarum Succulentarum, Narcissinearum Monographia," &c. It was first published in the "Gardeners' Magazine," and by permission afterwards copied in the "Floricultural Cabinet."

Time and space will only allow a few jottings of this article. He was a prophet, was Mr. Haworth, for he says they are well worthy of all the care and attention we can bestow upon them. And they will hereafter, through the medium of their very sportive seeds, become far more numerous, more various, more beautiful, and more attractive. (This is good.) He says: "I possess (alive) several other reputed varieties, but these I refrain from mentioning. I recommend their voracious and very fibrous roots to be parted in autumn or early spring, and planted in very rich manured light soil, at the foot of a south or west aspected wall, with not more than one, two, or three branches from each root, trained to the wall as regularly and as thinly as a Peach tree, cutting off all superfluous shoots and weak lateral flower buds. Thus treated these conspicuous plants will reach the height of 3ft or 4ft in the smaller sorts, and 7ft or 8ft at least in the taller kinds, terminating in abundant and most beautiful flowers, many of which will far surpass 5in in expansion, and with almost every colour, except deep scarlet and the tints of blue."

Mr. Haworth is not allowed to have all his own way, and is criticised by "Iris" in a subsequent article, who gives his views on growing them in pots, and who evidently knows a thing or two, for his last words are, as for the plants in pots, top-dressing is very beneficial.

Another correspondent gives his views on the way he obtains fine dwarf plants from 12in to 18in high. This ought to be a good hint to exhibitors, who often find it difficult to find plants dwarf enough to finish off their groups. His *modus operandi* is, early in May plants are plunged out in the open border, fully exposed to the sun, and well supplied with liquid manure, so as to get strong shoots by the middle of September. These shoots are bent down and laid into pots called small 48's. They very soon emit roots, and when established, disengaged from the parent plant, and placed in pits or frames.

"J. K." says: "In September tie some moss and mould round the stalk tight at the height you require, and in a fortnight roots will strike to the moss, and may be severed and potted in the usual way."

Double flowering Stocks. Many of us have erroneous ideas how such a large percentage of double flowers are procured from the single varieties from which the seed is saved. But "Paul Pry" lets us into the secret how it is done. Select those plants for seed that have more than four petals to each flower, and destroy those having only four. Sometimes plants will have flowers with six petals, or even more, and his views are confirmed by another contributor in a subsequent number. Noticing the word *Wiseton* reminded me of the *Schizanthus Wisetonensis* (twelve seeds, 2s. 6d.); but it proved to be an article on the *Gentiana acaulis*, by J. C. Hall, jun., Wiseton. I had always an idea that a strong soil was necessary for this plant, but Mr. Hall says different. They flourish with us in almost any soil (but prefer peat), so that is good news for us in this locality.—J. B. S.

(To be continued.)

## Gardeners' and Farmers' Friends.

Amongst the numerous feathered friends of the gardener and farmer—the different species of the family of Strigidae—the owls certainly occupy a prominent position, so far as their limited extent will allow, their narrowed limit being due principally to the prejudice of the game preserver, who wages an incessant war of extermination against them and all other birds and animals of prey, not without, however, some little cause for justification, considering that such as the owls and the hawk tribes do indeed occasionally indulge in a “titbit” in the shape of a young partridge or pheasant for the delectation of their young during the breeding season; but this is more than compensated for by their destruction of vermin, such as mice, moles, rats, and night-flying moths.

Apart from their utility there are no more interesting members of our wild feathered fauna than the owls, whilst at least two of the species, the barn owl (*Strix flammea*) and the brown or tawny owl (*Syrnium aluco*), may claim to be “domestic” owls, from their frequenting and breeding near the habitation of mankind. Remarking upon the folk lore of the owls, an ornithologist writer remarks as follows: “The owls have in most ages been classed by the ignorant among birds of ill-omen. Yet it is a question whether any one encountering an owl for the first time, and as an unknown bird, would have any other feeling excited in him save that of the ludicrous. Its upright posture, round, flat face, strangely set ears, or horns, as we may choose to call them, large, staring eyes, always turned to the spectator with such unmeaning solemnity, are irresistibly comical; and our merriment is increased by the absence of all sympathy in the bird, which, in spite of its human cast of features, is neither angered nor amused by our laughter, but retains the same grave expression, making no sign of response. It was probably on account of its grave looks and seeming power of abstraction that the Owl was dedicated by the Greeks to the goddess Minerva, and honoured as the Bird of Wisdom.” This evidently refers to the “horned” section of owls, and not the “barn” and tawny owls. The so-called horns, or ears, are technically termed egrets, consisting of a tuft of feathers, possessed by such as the long-eared owl (*Otus vulgaris*), the scops-eared owl (*Scops aldrovandi*), and the short-eared owl (*Otus brachyotus*).

Some of the species are less nocturnal in their habits than the others. The short-eared owl, for instance, has been known to catch up chickens from the farmyard, and has been seen in chase of pigeons. The only specimen of the long-eared owl the writer ever saw alive was captured amongst the rocky hills in Westmoreland. The two species that he was most intimately acquainted with were the brown owl and the tawny owl, when resident many years ago in South Warwickshire. In proof of the boldness of the barn, or screech, owl in defence of its young, the writer once had a remarkable experience with the mother of a nest of young ones situated in the long and spreading branches of Ivy, almost encasing the tower of a dismantled ancient church in the grounds of the ancestral home of one of Warwickshire's most illustrious families. The Ivy-mantled tower and ruinous walls of the nave of the church in question afforded an excellent abode for such as owls, doves, house-sparrows, and starlings, and upon one occasion the aforesaid writer ascended a ninety-“round” ladder to inspect the family nest of a pair of old tawny owls, and when in the act of inspecting the “hissing” young and their well supplied larder, consisting of a mole, a sparrow, and two or three field mice spiked upon the ends of the decaying branchlets of the Ivy, also the curious large deposit of “pellets” of undigested feathers and fur, ejected apparently by both old and young, and which, in conjunction with the rejected bones of their prey, proved to be not of an over-savoury scent for one's olfactory organism—suddenly a sharp blow on the right ear was felt, and when quickly looking round to ascertain the cause, one of the parent birds was observed to fly off and settle in a neighbouring tree. It had evidently been roosting in an adjacent part of the Ivyed nave-wall watching, and, on hearing the cries and hissing sounds of the young, boldly attacked the enemy. One of its claws pierced a hole through the lobe of the ear, from which the blood freely dropped. Fearing another attack from the same quarter, the interested intruder elected to descend from the eyrie as quickly as possible, and not run the risk of having possibly

an “ear-dropper” hole unceremoniously made through the lobe of the left auricle.

Remarking upon the voracity of the barn, or white, owl, Mr. Waterton says: “The service which the barn owl renders to the agriculturist by its consumption of rats and mice must be exceedingly great, yet it is little appreciated. When it has young it will bring a mouse to the nest every twelve or fifteen minutes. But, in order to have a proper idea of the enormous quantity of mice which the bird destroys, we must examine the pellets which it ejects from its stomach in the place of its retreat. Every pellet contains from four to seven skeletons of mice. In sixteen months from the time that the apartment of the owl on the old gateway was cleared out, there has been a deposit of above a bushel of pellets.” Another authority avers that as many as twenty rats have been discovered at one time in the larder of a pair of barn owls. What has been remarked on the barn owl very nearly applies to the less common tawny owl, and which is an habitué more of the woods than the barn owl.—W. G.

## The Garden City.

The prospectus of the company has been issued, and £20,000 is asked in ordinary shares of £1 each, for the purpose of taking the initial steps in building a Garden City. Messrs. Ralph Neville, K.C. (chairman); Edward Cadbury (of Cadbury Bros., Bournville); T. H. W. Idris, J.P. (chairman of Idris and Co., of London, Southampton, and Canterbury); Franklin Thomasson, of Bolton; T. P. Ritzema, J.P., Newspaper Proprietor, Blackburn; Ebenezer Howard, author of the Garden City idea; and Aneurin Williams, the well-known co-operator. Among the subscribers are Mr. Alfred Harmsworth, £1,000; Mr. W. H. Lever, £100 to £1,000 as required; Mr. Geo. Cadbury, £1,000; and Mr. J. P. Thomasson, of Bolton, £1,000. The two last being conditional on the whole amount being raised. This company has been formed for the purpose of carrying into effect the scheme suggested by Mr. Ebenezer Howard, in his book, entitled “Garden Cities of To-morrow” (Swan, Sonnenschein and Co.), and to assist in relieving the congestion in crowded cities by the redistribution of the industrial population upon the land. Mr. Howard's scheme is, shortly, as follows:—The purchase of a large agricultural estate of, say, 6,000 acres, with the object of establishing a Garden City. The retention by the community of the Garden City of the increased value of the estate. The estate selected to be carefully planned under the best expert advice, so that as the town grows its factories and workshops, the houses of the people, the parks and open spaces, schools, churches, and other public buildings may be placed in the most convenient positions. The provision of a broad belt of agricultural land around the town, under such restrictive covenants as may secure to the inhabitants the enjoyment for all time of the combined advantages of town and country life, while the agricultural tenants may have a market for their produce brought to their doors. The scheme provides for the retention of a very large amount of open space for recreative purposes, and for the allowance of land for a fair-sized garden to each house. It provides for a population of about 30,000 people, protected against overcrowding by strict covenants. The method proposed is to form a company to acquire or purchase a site, and let land to tenants on building leases and otherwise. The first charge on the net profits of such company would be a cumulative dividend to the shareholders, but such dividend would be limited so as not to exceed a rate to be determined at the formation of the company, say, 4 or 5 per cent. Any remaining profits would be applied for the benefit of the inhabitants of the town and estate, who would also have the right collectively, after a certain period, say seven years, to purchase the undertaking of the company at par.

All wishing to promote this promising scheme should apply to the secretary of the Garden City Pioneer Company, 77, Chancery Lane, London, W.C.

## Potatoes in Germany.

While greatly improving the Potato the Germans have so increased the crop that new ways of disposing of it have had to be sought. They now feed about two-fifths to farm animals, and the alcohol makers are striving to increase the demand for their product. So much of the Potato is water that 3½ tons may be reduced to one ton by drying. The dried Potatoes keep so much longer and are so much more readily transported that those interested in the industry feel justified in offering 30,000 marks as a prize for the best process of drying.

## Societies.

### R.H.S., Scientific Committee, August 5th.

Present: Dr. M. T. Masters (in the chair); Messrs. Douglas, Hooper, Bowles, Saunders, and Baker; Dr. M. C. Cooke; Revs. W. Wilks and G. Henslow, Hon. Sec.

*Potato tumour*.—Dr. Cooke reported on the specimens sent to the last meeting, which were attacked by a fungus named *Chrysophlyctis endobiotica*, which has never yet been described, though the disease, Dr. Masters observed, was not uncommon.

Laburnum, from which a cluster of shoots of *Cytisus purpureus* had grown out. It appears that the tree was purchased some twenty-seven or twenty-eight years ago as a young grafted plant of *C. purpureus* on *C. Laburnum*. The scion grew very well for a year or two on the stock, till a strong shoot grew out below where the graft was inserted. This was cut off to save the graft, but the graft died quite out soon afterwards. The stock was left to grow into a Laburnum tree, which is now from 15 to 20 feet high, and as much in diameter. After some three or four years the *C. purpureus* made its appearance in various parts of the Laburnum, and is now to be seen in tufts all over the tree. A somewhat similar case is recorded in the "Gardeners' Chronicle" (1857, p. 382), by Mr. E. Purser,

*Rosa rugosa*. (See page 148.)

*Larch disease*.—This had been referred to as a fungus of the name *Allescheria laricis*, which was unknown to Dr. Cooke. It turned out to be merely a "MS." name only, with no description, and afforded no solution to the problem of the disease.

*Silver leaf disease*.—Dr. Cooke also reported upon this well-known affection of species of *Prunus*, which has been found by Professor J. Perceval to be due to a fungus, the hyphae occurring where the roots are decayed, which produced sporophores of *Stereum purpureum*. By inoculating healthy Plum trees with the sporophores, the silvery appearance was visible after eight or nine weeks. The infection appears to take place below ground.

A unanimous vote of thanks was given to Dr. Cooke for his three reports, which will appear in full in the Society's Journal.

*Influence of scion on stock*.—Mr. W. B. Latham, of the Botanical Gardens, Edgbaston, Birmingham, sent a bough of a

Clapham Park. He wrote, "Some few years ago three grafts of the *Cytisus* (purpureus) were inserted, and now the whole character of the tree is changing, and every year since losing the yellow flower of the Laburnum and producing the short purple flower."

*Cattleya and Lalia cross*.—Mr. Douglas exhibited a plant, *L. C. Juno*, Edenside var., being *C. Mossiae* x *L. majalis*. It is usually considered an invariable rule that hybrid Orchids betray the characters of both parents. The present plant, though an undoubted cross, was thought to be exceptional. A coloured illustration which Mr. Douglas exhibited of *C. Mossiae*, together with the plant, showed a degree of yellow in the throat, which was wanting in the living plant, *L. majalis* has a very spotted lip; but this feature was also wanting in the plant. That a cross or hybrid, though usually intermediate, may have one or other parent prepotent is well known; but the second generation, as

Dr. Masters observed, will often reveal the other parentage more completely.

*Gypsophila paniculata dimorpha*.—Mr. Henslow called attention to the fact that different plants of this species may have different kinds of flowers, being gynodioecious; that is, in some the styles are greatly elongated, while the stamens are abortive; in others the styles are much shorter and the stamens perfect. They spread outwards, and not inwards as in the case of self-fertilising plants.

*Dendrobium Dalhousianum synanthic*.—Dr. Masters exhibited a specimen (received from Mr. W. Potter, Beckenham) of two flowers coherent by their ovaries and the two adjacent sepals, all the other parts being distinct.

*Proposed investigations*.—Mr. Elwes wrote, in reference to the Larch disease, of the difficulty experienced in obtaining any assistance from a practical point of view in dealing with what was proving to be a very serious disease among trees, and one of immense economic importance. He suggested that if a qualified person could be found, he should undertake a systematic investigation, for which a small grant from the Royal Society would most probably be forthcoming. Mr. Elwes adds that the disease cannot be studied in the laboratory alone, but only profitably by visiting places where it has appeared, so as to discover the conditions which produce it.

### Frome, August 4th.

The annual exhibition of this society was held on Bank Holiday, not under the best of weather conditions, the early morning and afternoon being stormy. This, however, did not detract from a good attendance. Despite the untoward season this exhibition, on the whole, was above its average, both in extent and quality, and its popularity gains, rather than diminishes, among exhibitors and the public who pay their annual visit.

Well filled classes are provided for groups, Ferns, flowering and foliage plants, Fuchsias, table plants, &c. The first-named naturally attract the first notice, and on this occasion additionally so, by the extent of competition. Messrs. E. S. Cole and Son, Bath, wrestled with Chas. Baily, Esq., Frome (gardener, Mr. J. Pope), for first prize, and succeeded both in winning and setting an example in decorative art, his Crotons, Hydrangeas, Amaryllis, small Caladiums, Eulalias, Orchids, &c., being disposed with much taste. Mr. Pope's group, however, was well arranged, and did credit to local effort and skill. There were other exhibits. Mr. George Tucker, Hilperton, won with six flowering plants, staging a fine Anthurium, Dipladenia, and Statice intermedia among them. Colonel Vivian, Trowbridge (gardener, Mr. W. Strugnell), well won the first prize for six foliage plants with Kentia Fosteriana and Belmoreana and Areca lutescens as his best. Ferns in twelve varieties were excellent, both in freshness, variety, and size of plant. Messrs. Stokes, Trowbridge, gained the premier honours, comprising among them *Leucostegia immersa*, *Adiantum fragrantissimum*, and *Lomaria gibba*, extra fine. With six varieties Mr. George Tucker was first, also good in plant and variety. Table plants were a nice feature, the competition keen, varieties good, and evenness marked throughout the whole. Messrs. Strugnell and Stokes and Son secured the prizes in the order of their names. Specimen trained Zonal Pelargoniums staged by Messrs. G. Tucker and Cory and Sons were in the pink of condition, as also were the trained Coleus from the last-named exhibitors. Groups of Begonias were very bright and choice; and cut flowers, Dahlias, Roses, Sweet Peas, greenhouse and perennials, made a brave display in bright and varied kind.

Fruit, as usual, made an attractive display, and though there were marked evidences of the lateness of the season, the extent and quality of the whole was extremely good. Mr. Pope won with six varieties, which comprised good Grapes, Peaches, Melons, Nectarines, and Cherries, Mr. Strugnell and the Fruit and Flower Co., Frome, taking the remaining prizes. With a collection of hardy fruit Mr. Strugnell won easily, as he did also with Nectarines, which gained him Messrs. Toogood's medal for the best fruit exhibit. The Fruit and Flower Co. won with Peaches, and A. R. Baily, Esq., triumphed with both black and white Grapes. Apples and Plums were scarce, and much below their usual standard in size and quality.

Several classes are provided by seedsmen for collections of vegetables, and though the competition was restrained by the exigencies of past weather, there were in many instances a keenness and high quality prevailing. Autumn Giant Cauliflowers, staged by Mr. Pope, were most superior, and Runner Beans from Mr. Hall, of Wells, were out of all proportion with past weather. Root vegetables, Peas, Tomatoes, and Potatoes were all of superior quality.

Non-competitive groups from the Earl of Cork's gardens, and from Longleat are an attraction of long standing at the Frome Shows. Mr. Pearce's Crotons are remarkable both for colour, development, and choice variety. C. Russeliana, Golden Ring, Sunset, Disraeli, and Countess were extremely bright. The group is made rich and varied by the great wealth of Croton foliage, and is toned only by the addition of Palms, Cannas, Ferns, and other bordering plants. The Longleat arrangement was enriched by the small but telling *Caladium argyrites*, *Begonia*

*Gloire de Lorraine*, *Eulalias*, *Celosias*, and other plants forming a base to tall spreading Palms above them.

### Malton, Yorks, August 6th.

This society held its forty-third annual show in the Orchard Field on the above date. Unfortunately the day was a very wet one, for although it cleared off soon after noon, it came on again about three o'clock, and continued during the rest of the day. Notwithstanding, there was a good number of visitors from the neighbouring towns and villages, as well as from Malton itself. This is rather a large show for a small town, embracing, as it does, in addition to the floral and horticultural section, agricultural and dairy produce, honey, poultry, pigeons, rabbits, cats, and dogs. It is the former section, however, only that will have most interest in these pages.

Like many other shows, the specimen plants exhibited are not so good as they were a few years ago. The principal class was for six stove or greenhouse plants in bloom, for which prizes of £5, £2 10s., and £1 10s. were offered. Mrs. Kitchen, of Darlington, was an easy first with *Rondeletia speciosa*, *Allamanda Hendersoni*, *Clerodendron fallax*, *Dipladenia amabilis*, *Clerodendron Balfouriana*, and a seedling *Dipladenia*. Messrs. Simpson and Sons, of Selby, were second. The same exhibitors also took the prizes for three ditto in the same order. Mrs. Kitchen staged four exotic Ferns, good specimens; Messrs. Simpson and Sons second. Ericas, Fuchsias, Caladiums, Begonias, Geraniums, Liliums, and other plants had classes provided for them, and were fairly well shown. Plants for dinner table decoration are always an interesting feature. There were two classes, one for six plants, the other for three. Mrs. Kitchen secured first place in both classes; Mr. McPherson, gardener to the Earl of Londesborough, second; Messrs. G. Longster and Sons, Malton, were third; in the first class Messrs. Simpson and Sons third for three.

There was a very good display of cut flowers, and the stewards had great difficulty in finding room for all the exhibits, which, perhaps, may be some excuse for the unsatisfactory manner in which they were staged.

Dahlias were not so good as they usually are. There was only one entry for twenty-four Show Dahlias, set up by Messrs. Clark and Son, of Rodley. The same exhibitor was first for twelve; Mr. R. Gowthorpe, York, second; Mr. Hutchinson, Kirbymoorside, third. Messrs. Clark also took the prize for Cactus and Fancy varieties, and Mr. Hutchinson for bunches of Pompons. A large quantity of Sweet Peas were shown, enough to fill half the space almost allotted to the cut flower section. There were three classes, for twelve, eight, and four distinct varieties. Mr. R. Akester, Driffeld, was first in all three classes, and Mr. Hutchinson second. Good herbaceous flowers were set up, the best being by Mr. Hutchinson, followed by Messrs. Harkness and Sons and Mr. R. Dobson. Mr. J. Whitehead secured first prize for twelve bunches of annuals.

Roses were well shown, Messrs. Harkness and Sons were first for twelve distinct varieties, staging beautiful blooms, comprising Gladys Harkness, Madame Jos. Courbet, François Michelin, White Lady, Her Majesty, Captain Hayward, Marchioness of Downshire, Duke of Fife, Gustave Piganeau, Bessie Brown, Ulrich Brunner, and Marchioness of Londonderry; Mr. Hutchinson was second, with good blooms; Mr. R. Dobson third. For six varieties, three blooms of each, the same exhibitors carried off the prizes in the same order, G. L. Beeforth, Scarborough, being third. Messrs. Harkness were first for six Tea Roses; Mr. Hutchinson second. The last named exhibitor had the best basket of cut Roses most tastefully arranged, they being chiefly dark varieties; Mr. L. J. Horsley, Norton, second. Some nice bridal bouquets were staged, the best being from Mr. J. Horsley; followed by Mr. R. Akester and Messrs. G. Longster and Sons. Mr. McPherson was first for a basket of Carnations most tastefully arranged.

Prizes were offered for many other kinds of flowers, but want of space prevents particularising. Wild flowers were well shown in two classes, for twelve distinct varieties and hand bouquet; there were several entries in both classes, Mr. J. Whitehead, of Appleton, being first; Miss D. Ward, Amotherby, second; Mr. G. Wray, Thorpbasset, third in the former class. We like to see wild flowers catered for at provincial shows.

In fruit, the first class was for four varieties. Mr. McPherson secured first place with Muscat of Alexandria Grapes, Royal Jubilee Melon, Bellegarde Peach, and Queen Pine, all good. He was followed closely by Mr. T. Hague, Carlton, who had Black Duke Grapes, Royal Sovereign Melon, Black Prince Pine, and Violette Hâtive Peach. Three bunches black Grapes were staged by Mr. Hague, who had Black Hamburgh; Miss A. Harrowing, Sleights, second; J. E. Stringer, Esq., Slingsby, third, with Gros Maroc. In the corresponding class for white Grapes, Mr. McPherson was placed first; Mr. T. Hague, second; J. E. Stringer, Esq., third, all staging Muscat of Alexandria. Mr. McPherson was also first for six Peaches; Mr. T. Hague second. The last named was first for six Nectarines; Mr. McPherson second. For one Melon, Mr. Hague was first; Mr. Freeman,

Malton, second. Apples, Pears, and Plums were much below the usual standard, owing no doubt to the cold season. George Hall, Esq., Brawby, was first for six varieties of baking Apples; Mr. J. Whitehead second. For three varieties of Pears, Mr. J. S. Upex, gardener to Hon. H. W. Fitzwilliam, was first; Mr. J. Horsley second. Small fruits were below the average both in quantity and quality.

Some good vegetables were shown. Potatoes very good; tap-rooted vegetables not quite as good as usual. Messrs. G. Longster and Sons were awarded a Certificate of Merit for an exhibition of choice cut flowers and plants which were not for competition.

### The Midland Carnation and Picotee, August 7th and 8th.

The annual exhibition was held in the Exhibition Hall of the Botanical Gardens, Edgbaston, and considering the somewhat unfavourable character of the season, it compared most favourably with its predecessors. There were upwards of 500 entries, and there was a keen competition in several of the leading classes. Unfortunately, however, owing to the rain that prevailed on both days, there will be a considerable financial deficiency. The absence of the collection of Carnations and Picotees of Mr. Martin Smith and Mr. Douglas were missed from the South, but were compensated for by the fine exhibits of the other contributors. The arrangements, as usual, were satisfactorily carried out, and much credit was due to the energetic and hard-working assistant secretary, Mr. Herbert Smith. At the luncheon, it was with a species of regret that Mr. R. Sydenham announced his retirement, owing to pressure of other business affairs, from the official position he has so long held in connection with the society, and he had much pleasure in announcing that Mr. W. H. Parton, Kingsheath, an ardent Carnationist, had consented to succeed him. Mr. Parton in response remarked that he hoped to do all that lay in his power to follow in the footsteps of Mr. Sydenham, very difficult though it might be.

There was an extremely keen contest in the class for twelve self Carnations, dissimilar, nine exhibits being staged, and the major portion of the blooms of excellent quality. Mr. Samuel Gibbs, gardener to Mr. Robert Sydenham, was placed first with large clean blooms. A tendency to roughness, however, was apparent in two or three of them. The complement consisted of Sapho, Hildegunde, Boreas (all excellent), Midas, Exile, Almoner, Queen of Scots, The Naiad, Bishop Ipsley, Mrs. Colby Sharpin, Her Grace, and Comet. The second prize was annexed by Mr. R. G. Rudd, gardener to Mr. R. C. Cartwright, with a lot hardly inferior to the premier set; his varieties were Orpheus (fine), Mrs. Eric Hambro, Sir Bevys, Ensign, Endymion, Seagull, Germania, Her Grace, Vivid, Benbow, Much the Miller, and Comet. Third, Mr. C. F. Thurstans, Wolverhampton; fourth, Mr. W. H. Parton, King's Heath; fifth, Messrs. Thomson and Co.; sixth, Mr. A. Chatwin, Edgbaston; seventh, Mr. A. R. Brown, Handsworth.

For six selfs there were fourteen contestants. Mr. A. W. Jones, Stetchford, led with a superb board of Hildegarde Britannia, Lady Hermione, Much the Miller, Mrs. Eric Hambro, and Sirdar. The Rev. C. A. Gottwaltz, Droitwich, scored a good second with Chaucer, Waxwing, Mrs. Eric Hambro, Pink Pearl, John Pope, and Bishop Ipsley; whilst Messrs. W. H. Twist, Yardley; C. W. Kemp, Edgbaston; J. F. Smith, Sparkhill; Blackmore and Langdon, Bath; and David Walker, Kilmarnock, followed in the order named.

The five exhibits in the class for twelve yellow-ground Picotees made a splendid display, and Messrs. Thomson and Co., Birmingham, won the blue ribbon with grand blooms of Lady Bristol, Lady St. Oswald, Mrs. Herbert, Ladas, Gertrude, Hesperia, Childe Harold, Mohican, Heather Bell, Lauzan, Badminton, and Kittywake; second, Mr. R. G. Rudd, with Lady St. Oswald, Alcinous, Mohican, Onda, Edith, Mrs. Tremayne, Lauzan, Lady Bristol, Gertrude, Childe Harold, Daniel Defoe, and Heliodorus; the three following awards fell to Messrs. Artindale and Co., Sheffield, W. H. Parton, and S. Gibbs.

For six yellow-ground Picotees Mr. A. W. Jones was invincible with a superb set of Lady Bristol, Lady St. Oswald, Lauzan, Gertrude, Edith, and Heather Bell; second, Messrs. Blackmore and Langdon with fine examples of Alcinous, Gertrude, Childe Harold, Mr. Keeling, Lauzan, and Maudie. Messrs. C. F. Thurstans, A. Chatwin, S. Gibbs, W. and D. Rotch, of Liverpool, and A. R. Brown were the other successful winners out of sixteen competitors.

There were ten exhibits in the class for twelve Fancy Carnations, distinct, and Mr. R. G. Rudd was honoured with the first prize for Argosy, Duke of Alba, Queen Bess, Voltaire, Hidalgo, Stanley Wrightson, Renegade, Muleteer, Charles Martel, Goldylocks, Pagan, and Helios; the second prize fell to Messrs. Thomson and Co. for a close lot of Brodick, The Gift, C. B. Thomsen, Sunset, Jessie Donz, Voltaire, Clara Butt, Surprise, Hidalgo, Faust, Galileo, and Oberon. Messrs. W. H. Parton, S. Gibbs, Artindale and Son, A. R. Brown, and W. D. Rotch were respectively successful out of the ten competitors.

Mr. A. W. Jones again led for six Fancy Carnations, dissimilar, with grand flowers of Argosy, Elaine, Argosy (sport), Eldorado, Aglaia, and Meteor; second, Mr. J. F. Smith, Sparkhill, with Lady St. Oswald, Alcinous, Mrs. Herbert, Hesperia, May Queen, and Heather Bell; and Messrs. C. F. Thurstans, W. Spencer (Windsor), C. W. Kemp, A. H. Beadles, E. J. Wootten, and Pemberton and Son, in their order named.

There was a keen contest in the class for twelve white-ground Picotees, dissimilar, and Messrs. Thomson and Co. led with grand examples of little Phil, Brunette, Mrs. Beswick, Mr. Openshaw, John Smith, Fortrose, Favourite, Pride of Leyton, Amy Robsart, Thomas Williams, Muriel, and Mrs. Sharpe; the second position was accorded Mr. A. R. Brown with fine examples of Brunette, Favourite, W. H. Johnston, Miriam, Mrs. Beswick, Mr. A. R. Brown, Ganymede, Thomas Williams, Mrs. Gorton, Aggie, Fanny Fell, and Unique. Messrs. Pemberton and Son, C. F. Thurstans, S. Gibbs, and Artindale were the other winners.

For six white-ground Picotees, Mr. W. H. Goodfellow went to the front with a nice lot, consisting of Lavinia, Brunette, Ganymede, Grace Darling, Harry Kenyon, and Mrs. Openshaw; second, Mr. J. J. Keen, Southampton, with Amy Robsart, Little Phil, Mrs. Payne, John Smith, Grace Darling, and Thos. Williams; whilst Messrs. D. Walker, A. H. Bedales, Sydenham, J. F. Smith, Charles Chatwin, and E. J. Wootten followed on.

For twelve flake or bizarre Carnations, dissimilar, Messrs. Thomson and Co. were again victorious with fine examples of J. S. Hedderley, Gordon Lewis, Master Fred, Meteor, Geo. Melville, John Wormald, Robert Lord, Wm. Skirving, Sportsman, Robert Houlgrave, J. D. Hextable, and Admiral Curzon; the second prize went to Messrs. Pemberton and Son for R. Houlgrave, Gordon Lewis, Sportsman, Mrs. Rowan, Admiral Curzon, Geo. Melville, Robert Lord, Geo. Rudd, Merton, Robroy, Flamingo; and Messrs. S. Gibbs, C. F. Thurstans, and Artindale were the other winners.

In the class for six flake or bizarre Carnations, Mr. D. Walker, Kilmarnock, was the victor with excellent blooms of Geo. Melville, J. S. Hedderley, John Wormald, Mrs. May, Master Fred, and R. Houlgrave; whilst Mr. T. W. Goodfellow trotted in with J. S. Hedderley, G. Rudd, Merton, Sportsman, Gordon Lewis, and Miss Constance Graham; the others were Messrs. J. J. Keen, E. J. Wootten, and Geo. Chaundy, Oxford. The amateurs, or for those who do not employ a gardener regularly, exhibited well in the classes set apart for them, and included Messrs. C. J. White, Walsall; J. Williamson, Smethwick; J. W. Smart, Moseley; W. Moore Binns, Worcester; H. Boys, Walsall; and T. Newton, King's Heath.

There was an extensive and keen competition in the classes devoted to single blooms. Exhibitors were allowed to stage two flowers in each class, and win with both. The society offered a silver medal to the most successful exhibitor in those classes. Five prizes were offered in each class; but we purpose noting the three leading exhibits in each. For a scarlet bizarre, Messrs. Pemberton and Son won with Robert Houlgrave; second, Messrs. Thomson and Co. with the same variety; and Mr. H. Boys following suit with the same. For a crimson bizarre, Messrs. Thomson and Co. led with J. S. Hedderley, second and third Mr. D. Walker with J. S. Hedderley. For a pink or purple bizarre, Messrs. Thomson and Co. were again to the fore with Geo. Rudd; second, Messrs. Pemberton and Son with Wm. Skirving; third, the same with Geo. Rudd.

For a scarlet flake bizarre, Mr. C. J. White won with Sportsman; second, Mr. W. Walker with W. Wormald; and third, Thomson and Co. with Sportsman. For a rose flake bizarre, Messrs. Thomson annexed the first prize with Meteor; second, G. F. Goodfellow with Merton; and Messrs. Thomson with Mrs. Rowan. For a purple flake bizarre, Messrs. Pemberton won with Gordon Lewis; second, the same with Geo. Melville; and third, Messrs. Thomson with Gordon Lewis.

**PICOTEES AND FANCIES.**—For a heavy red edge, Mr. C. F. Thurstans led with Brunette; second, C. F. Goodfellow with Brunette; and Mr. J. J. Keen with John Smith. For a light red edge, Mr. C. F. Thurstans was first with Mrs. Gorton; second, Messrs. Pemberton and Son with Thomas Williams; and third, Mr. S. Gibbs with Thomas Williams. For a light purple edge, Messrs. Thomson were first with Pride of Leyton; second, Mr. W. H. Twist with Somerhill; third, Mr. E. J. Wootten with Pride of Leyton. For a heavy rose edge, Messrs. Pemberton with Little Phil; second, Mr. R. G. Rudd with Little Phil; third, Mr. D. Walker with Mrs. Beswick. For a heavy scarlet edge, the Rev. C. H. Gottwaltz won with W. H. Johnston; second, Mr. W. Spencer with the same variety; and third, Mr. J. J. Keen with Scarlet Gem. For a light rose or scarlet edge, Messrs. Thomson were to the fore with Fortrose; second, Mr. S. Gibbs with Favourite; and third, Mr. A. R. Brown with Favourite.

For a yellow ground Picotee—wire edged—Mr. S. Gibbs was placed first and second with fine blooms of Childe Harold; and third, Mr. W. Spencer with the same variety. For a medium or heavy edged variety, Messrs. Thomson led with

Gertrude; second, Mr. G. Chaundy with Gertrude; and Mr. S. Gibbs third and fourth with Gertrude. For a yellow ground Fancy, Mr. W. M. Binns led with Oakley; second, Mr. J. H. May, Malvern, with Argosy; third, Mr. R. G. Rudd with Argosy.

For a Fancy Carnation, other than yellow ground, Messrs. Blackmore and Langdon secured the first prize with Millic; second, Mr. A. R. Brown with Artemis; and third, Mr. S. Gibbs with Muleteer.

In the class for selfs, for a white or blush, Mr. G. F. Thurstan was to the front with Mrs. Eric Hambro; second, Mr. W. Spencer; and Mr. A. W. Jones third; both with Mr. E. Hambro. For a yellow self, Mr. W. H. Parton won the first prize with Britannia; second, Mr. A. W. Jones with Almeria; and third, Mr. S. Gibbs with the same variety. For a buff or terra-cotta, Mr. S. Gibbs led with Benbow; second, Mr. R. G. Rudd with Mr. R. C. Cartwright; and third, Mr. C. F. Thurstan with Benbow. For a rose, pink, or salmon, the first prize was won by the Rev. C. A. Gottwaltz; second, Messrs. Thomson and Co. with Ladik; and third, Mr. A. R. Brown with John Pope. For a scarlet, Mr. R. G. Rudd first with Binglass; second, Mr. A. H. Parton with W. J. Crane; and third, Messrs. Artindale with Lady Hindlip. For a dark crimson, maroon, or other dark self, Messrs. Thomson led with Miss F. Sims, a very deep but bright crimson of large size and fine substance, it is likely to be the leading variety of the kind for a long time, and, of course, is highly prized by Mr. C. R. Herbert, that firm's expert raiser, a First Class Certificate of Merit was awarded it; second, Mr. R. G. Rudd with Sir Bevys; and Mr. S. Gibbs with Agnes Sorrel.

There was a very strong competition in the popular class for undressed and border varieties, foliage and buds allowed. Space prohibits details; and it must suffice to remark that the major portion, both of exhibitors and the varieties, of Carnations and Picotees were represented, as in the previous mentioned classes. It should be mentioned that the Rev. C. A. Gottwaltz's new variety of Carnation, John Pope, is a distinct and striking rose pink self, and it was awarded a First Class Certificate of Merit.

**PREMIER BLOOMS.**—There were several prizes awarded in this class—Mr. A. W. Jones for Eldorado, Messrs. Thomson for Pride of Leyton, Gertrude, Childe Harold, and Mrs. Sims.

Shower bouquets of Carnations or Picotees were very well put up by Messrs. Artindale and Co., Messrs. John Pope and Son. For spray of Carnation or Picotees, Mrs. A. M. Wilson (Spilsby), Mr. S. Gibbs, and Mr. W. B. Latham were the prizetakers. For buttonholes, Miss J. E. Kemp, Messrs. Artindale, and R. G. Rudd, as mentioned. There was a strong competition, and excellent taste was displayed throughout.

Sweet Peas were a fine feature, and a strong competition was in force for Mr. R. Sydenham's special prizes. Mr. F. J. Clarke, Leicester, led with a grand lot; second, Mr. V. B. Johnstone, Wolverhampton; and third, the Rev. T. Buncombe, Ruabon. For a floral arrangement of Sweet Peas, the first prize was given to Mrs. Simpson, Shipston-on-Stour; second, Mr. H. Hookham, Selly Hill; and third, Mr. A. Measton, Selly Park.

There was a fine display of collections of flowers by the trade, being exceptionally good. Honorary awards: A Silver-gilt Medal to Mr. B. R. Davis, Yeovil, for cut Begonias, and to Mr. Amos Perry, Winchmore Hill, London, for a beautiful display of Nymphæas and other hardy flowers. To Mr. W. Sydenham, Tamworth, a Silver Medal for a splendid display of Violas, designs in Roses, bunches of Roses, &c.; to Messrs. Dickson, Chester, for a fine collection of hardy flowers; to Mr. J. White, Worcester, for a fine collection of hardy flowers; to Messrs. Simpson and Sons, Sweet Peas; to Mr. Mortimer, Farnham, for collection of Cactus and Show Dahlias; to Messrs. Phillips and Taylor, Bracknell, for collection of Carnations; and to Messrs. Hewitt, Solihull, for a grand collection of hardy flowers.

### Irish Gardeners' Association.

Upon July 31, the above society held a display of Roses, Carnations, Sweet Peas, and Tomatoes. The exhibits were limited to the members, and were held at their usual quarters in D'Olier Street, but the space available was by far too cramped for their effective display. The exhibits revealed the high water mark of culture, and the task of judging was discharged by Messrs. F. W. Burbidge, M.A., F.L.S. (president), W. Ramsay, J.P. (Ballsbridge), and Mr. Dick (late superintendent of Phoenix Park). Mr. Cavanagh, gardener to R. W. Booth, Esq., Victoria Castle, Dalkey, took the first prize for Roses with a superb array, considering the mid-season. The second prize fell to the lot of Mr. Kavanagh, gardener to Mrs. Falls, Shankill, with a very meritorious group, and Mr. Richardson, gardener to Major Cusack, Abbeyville, Malahide, was third. The stand comprised twelve Roses in at least six varieties on stalks, with their own foliage, for a stand of six bunches of Sweet Peas with their own foliage, lightness of effect to be taken into consideration, along with quality of bloom, for premier place, Mr. Cavanagh, gardener to R. W. Booth, Esq., Victoria Castle, Dalkey, came first with a very effective display, while Mr. Ryan, gardener to J. Clancy,

Esq., Artane, was second with fine flowers, but bunching too massively. Mr. Richardson, gardener to Major Cusack, was a good third. For a stand of eighteen Carnations in six varieties at least, no prize was given, owing to the want of sufficient entries, nevertheless the stand erected by Mr. O'Kelly, gardener to W. J. Murphy, Esq., Dartry, Palmerston Park, deserved something more than a highly commended, as the blooms were large, good colour, and form. For a dish of Tomatoes, not less than four fruits to be shown, the prizes had likewise to be withdrawn owing to want of competitors, yet the respective dishes of Mr. D. Ryan, gardener to J. Clancy, Esq., Artane, and Mr. O'Kelly, gardener to W. J. Murphy, Esq., Dartry, were of a high order of merit, and were highly commended. The judges subsequently stated they would have liked to award prizes in the last two classes, as they were thoroughly deserved.

Messrs. Alexander Dicksons and Sons, Newtonards, Belfast, displayed a matchless array of Roses. Amongst the many staged, they likewise submitted for the first time four new seedling Roses which have not been shown hitherto, and are not yet in commerce, namely, Mrs. David McKee, in colour a pale primrose yellow, and very heavily scented, delicate, of fine form, with a faint tinge of crinkling in the petals, giving the idea of an egg shell; Bob Davison, a fine flower of massive proportions, in colour a dark crimson; Lady Ashtown, of fine shape, similar to W. J. Grant, a tapering bloom with great depth of substance; and John Ruskin, a medium built Rose, in hue a rosy pink. For the latter they were unanimously awarded the society's certificates. Messrs. Watson and Sons, Clontarf, showed Carnations and Picotees to advantage, comprising a very fine collection, the varied types were bunched with their own foliage, and were much admired. They were awarded the society's certificate for cultural excellence.

Subsequently, the financial report was submitted for approval, and it showed a steady increase in the funds of the society. Mr. Cottier moved the adoption of the report, and was seconded by Mr. O'Kelly, and it was passed unanimously. Then Mr. Campbell, gardener to Lady Ardilaun, St. Ann's, Clontarf, very pleasantly discoursed on Roses.

### The National Fruit Growers' Federation.

At a meeting of the provisional committee of the above Federation, held lately at the Westminster Palace Hotel, Colonel C. W. Long, M.P., president of the Federation, in the chair, it was announced that the Marquis of Camden had accepted the position of patron, and that the following gentlemen had been added to the list of vice-presidents: Sir A. F. Godson, M.P., Colonel Warde, M.P., Messrs. P. S. Foster, M.P., J. Howard, M.P., G. Guy Pim, M.P., George White, M.P., and C. W. Radcliffe Cook, late M.P. for Herefordshire. A large number of leading fruit growers were then elected as members of the Federation. In addition to the routine business, an important discussion took place on the vital question of fruit distribution. It was opened by a member, who called attention to many startling facts on the authority of the United States Year Book, in connection with this problem, which so vitally affects the interests of both growers and consumers in this country.

The present system, or rather absence of system, he showed, was little less than a national disgrace, paralysing as it does the successful production of soft summer fruits, notably Strawberries and Raspberries, which are placed on the market with alternate gluts and short supplies, with the result, in the first instance, that much fruit is sold at a price less than the cost of picking, and in the second at a prohibitive one to the ordinary householder. In the year 1871 there were about half a dozen large fruiterers in London, when only Oranges and Lemons were offered, besides home-grown fruits in their season. The revolution since then has been due to the discovery in 1889 of the refrigerating or dry air process. Three years later, 600 refrigerator cars were running in the United States and Mexico, and last year 60,000 were at work, by which means 95 per cent. of the Californian fresh fruits are distributed. Owing to dry air transit, we now see in London vast numbers of shops selling foreign fruit in good condition, while our own producers, within fifty miles of market, are unable to compete without risk of ruinous loss for want of proper modern facilities, and unless something is done their industry must be entirely swamped by importers. In the opinion of the speaker, refrigeration, if adopted in this country, would save the position and solve the distribution problem. Soft fruits arriving at the large termini need not then be crammed on to a glutted market, when the jam houses are full, as if properly packed and placed in the cars in good condition they would retain that condition from two to five days. The supply would thus be steady and equal to the advantage of all concerned, and towns which now scarcely see the popular Strawberry and Raspberry would get their share.

It was resolved to request the railway managers to receive a deputation in October to confer with them on the best means of avoiding losses by delay in delivery of fruit, whether by the use of refrigerator cars or otherwise.

## Young Gardeners' Domain.

### Stoking.

Stoking in my opinion should receive by young gardeners the same careful attention they would attach to Orchids or other branches. But I am afraid there are some who regard certain parts of the profession (because they don't seem so interesting as others) not worth that due care and cleanliness that should be bestowed on them. Stoking is one of these, and it is often, so often terribly neglected. The way to treat and manage a fire properly was one of the first lessons taught me when I commenced work. I have profited much by that lesson, and remembrance is still vivid.

Of course any practical person knows how to light a fire, and no doubt not a few know how to manage it with success afterwards; to the uninitiated it is, I write. The first operation when starting a fire is to thoroughly clean it of all dust and clinker, moving the mass, which should be comparatively small, to and fro till the work is properly done; draw the fire near the dead-plate and clean the back of all dust, otherwise a bad circulation of draught will follow. This finished, keep the fire well forward to the door, and commence feeding. Clean ash-pit daily, and brush up the stokehole. Now, every time the fire is stoked, keep the back clean, and the clinker-rake well worked between the bars from underneath.

Never put a lot of fuel on at one time. If it is necessary to drive fiercely, my motto is to feed sparingly, but attend frequently. It is a great mistake to attempt to obtain the maximum amount of heat by fiercely driving the fire and wasting large quantity of fuel, with the damper carelessly used, by having it too far out or up, as the case may be, causing a lot of heat to go up the chimney without giving much help to the boiler.

The theory of stoking is to get the greatest amount of heat with the least amount of trouble and expenditure, and this is more easily accomplished by keeping the fire well forward, so enabling the flame-heat to travel the whole length of boiler, and that not too swiftly. Of course, when the term "banking-up" is used, the work is in a sense reversed. Push the fire a reasonable distance towards the back of boiler, and throw on the quantity of fuel considered enough to last, regulating the damper accordingly. The foregoing remarks apply principally to boilers of the saddle and Cornish types.—A MAN OF KENT.

### Lispings.—BY ONE OF FLORA'S NURSERY.

A garden is a place where we grow flowers, vegetables, and sometimes fruit, but fruit is usually grown in orchards. In some places only flowers are grown in the gardens, and in others only vegetables. The gardens are larger in the country than in the towns. There are two kinds of flowers: (1) Garden flowers, and (2) Wild flowers. I will now try to give a list of garden flowers: Roses, Lilies, Violets, Daffodils, Snowdrops, Crocuses, Asters, Stocks, Wallflowers. It is only a short list, but I must now get on to something else. I would like to give you my idea of a pretty garden—how a garden ought to be in summer.

Take a round garden, for instance. It ought to have a border of Roses and a lawn in the midst, with a summer house at one side and a pretty pink and white rockery on the other. A front garden in spring looks best with plenty of those pretty spring flowers, such as Crocuses, Snowdrops, Hyacinths, Primroses, Winter Aconites, Daffodils, and Violets. Gardens in which very little can be grown do not look badly with a rockery all round covered with Ivy, Woodruff, Creeping Jenny, and Periwinkle. Lawns look much nicer with a floral border than just plain, and gardens look nice with plenty of large shady trees. I once lived at a house where there was a Rose tree nearly as big as a summer house, and the name of the Rose was "Ruga" (?).

In autumn everybody ought to take great care to sweep up the leaves, as it makes the garden untidy to have leaves blowing about. Rose trees look very nice on walls as hedges, and up pillars. At the house I am living at now there is rather a pretty rockery in the middle of the front garden. Window-boxes look very nice filled with Stocks and Asters. Clematis and Roses look very pretty on old rustic porches. Last year we had a large bed of Poppies of every shade except blue. We had two very pretty tall flowers last year, which were large Lilies and Hollyhocks. One of my mother's favourite flowers were Convulvulus, because every morning there was a different colour. Children are very fond of having little gardens of their own in which they grow all manner of funny things, such as Chickweed, &c. We have a Willow tree in the front garden, which is very nice to hide under in summer. One ought to kill all the snails one sees, for snails eat up all leaves, and then the plant dies. Gardens look nice in winter with a few evergreens, such as Holly, Myrtle, Ivy, and Laurel. When gathering flowers children often get them with very short stalks, but when I pick flowers my mother makes me pull them with long stalks, and she tells me not to forget plenty of foliage.—DAFFODIL MARGARET FISHER, aged 9 years.

### Fruit Forcing.

**PEACHES AND NECTARINES: EARLIEST FORCED HOUSE.**—Trees started in December and early January must not lack water at the roots. When this occurs during the formation and perfecting of the buds they become "deaf," and fall instead of expanding into blossom when started. Affording a slight shade to trees under fixed roofs where the panes of glass are large has the advantage of preserving the foliage in good condition, thus preventing premature maturity of the foliage and the over-development of the buds, which is one of the causes of their dropping. Supply a top-dressing of phosphatic and potassic manure to weakly trees, and water as may be necessary to keep the soil in a moist condition. Needless waterings only saturate the soil, sour it, and destroy the roots. Where the lights have been removed watering may not be required, but attention must be given to this matter by timely examination. Rain is accompanied by a lower temperature, and no harm results provided the borders are properly drained; indeed, the ammonia and nitric acid brought down by rain have a most beneficial effect on the trees. Allow some laterals that are green to remain, as such unripe growths act as outlets for any excess of sap, a safeguard against starting the buds, hence in pruning it is not desirable to cut back next year's bearing wood unless the shoots are of great length. Very little pruning will be needed providing disbudding has been properly attended to, and no more wood been trained in than is absolutely necessary to replace that bearing in the current year, and to renew worn-out growths. Early forced trees do not, as a rule, make strong growth, and there is often a preponderance of blossom over wood buds, therefore need but little pruning. Trees long subjected to early forcing become enfeebled and are benefited by cutting out some of the old wood, especially the long branches, but this must be done judiciously, always having regard to a crop. Some trees are the exact opposite, making too vigorous growth, long-jointed, and these should be restrained. This is not effected by stopping, though it is useful in causing a diversion of the sap from the strong to the weaker parts of the trees, thereby assisting in an equal distribution of the nutriment, consequently tending to the maturity of the wood and buds. Any trees that grow too vigorously must be lifted and their roots laid in firm material near the surface. Those showing symptoms of weakness may have the old soil carefully removed from amongst the roots, supplying turfy loam, with an 8in potful of two parts wood ashes and one part bone-meal, mixed, to each barrowload of rather strong loam. Give a good watering both to lifted and soil-renovated trees, mulching with short manure. These operations require to be performed as soon as the leaves have matured; but by or before they fall from the trees.

**SECOND EARLY HOUSES.**—The trees having had the bearing wood cut out and kept free from insects, will now have the wood sufficiently matured to admit of the removal of the roof lights, where these are moveable. This exposure has a beneficial effect on the trees, the air hardening the growths, and the dews and rains cleansing the foliage, while growth is arrested on the one hand, and steady maturity of the other secured. In the case of fixed roofs and the panes of glass large and clear, it is an excellent plan to coat the glass with a thin wash of whitening and skim milk, applying with a brush. Admit air to the fullest extent, and see that the trees are kept free from insects and not neglected for water at the roots.

**TREES CLEARED OF THEIR CROPS.**—Cut away the shoots that have borne fruit unless required for extension, and where the growths are too crowded they should be thinned. This will allow air and light to harden the wood by increasing evaporation and elaboration, and more food will be stored in the buds and adjacent stems for the benefit of the blossoms and fruit in the coming season. It will also permit of the foliage being kept clean and healthy through freer access of water by the syringe or engine, also, if necessary, the more efficient application of an insecticide for cleansing the trees of red spider, brown aphid, and scale. These matters are very important, as it is essential that the foliage be kept clean and healthy to the last. Water must be given, as it is necessary at the roots, but avoid needless waterings, especially when the trees are vigorous, and lifting is intended. Admit air to the fullest extent, especially at night.

**HOUSES WITH FRUIT RIPENING.**—A free circulation of air will enhance the quality of the fruit, and water need only be given to prevent the foliage becoming limp. Secure air moisture by an occasional damping of the house for the benefit of the

foliage, also fruit, which in an arid atmosphere is liable to become mealy, whilst it ripens prematurely if the trees suffer by want of water. Ants are often troublesome. They take to treacle greedily. Bits of sponge held tightly in the fingers, then dipped in the syrup and then relaxed, will absorb some, and a gentle squeeze in withdrawing will leave enough in the sponge to entice the ants. These laid in saucers in their haunts will rid any place of the active creatures by immersing the sponge occasionally with the ants in them in boiling water. Cleanse the sponges each time, and repeat the dipping. Partially picked bones, such as come from table, are admirable baits for ants, the bones quite dry and fresh being laid in their haunts, and when they are covered with the pests immerse them in boiling water. The bones freed from the surplus moisture are available for a considerable time, as the immersion in boiling water destroys the fungoid and animal germs inducing putrefaction.

**LATE HOUSES.**—Trees that have the wood thin have a better chance to ripen, and the foliage to elaborate the sap, than these with the summer growths laid in so closely as to impede air and light. On the assimilation of the food depends its storing in the wood and buds for the support of the blossom and embryo fruit in the coming season. Gross growths tend to impoverish the weaker, appropriate an undue amount of sap, and tend to gumming and unprofitableness; they must be stopped or removed. An even spread of moderately strong, short-jointed wood is desirable. Ventilate the house early in the morning, allowing a good heat by day, and closing so as to secure 85deg or more, for sun heat after evaporation has been going on for some time will not do any harm, if care be taken to admit a little air before nightfall, and the temperature to gradually cool down, thereby securing rest. The night and early ventilation tends to the solidification of the growth and its ripening. Syringe to keep down red spider.—**ST. ALBANS.**

### Kitchen Garden.

**TURNIPS.**—One of several sowings, small or large, according to the demand of the roots during late autumn and winter should now be made. Dig over a piece of ground, making it level and fine, and draw drills at least a foot apart. They only require to be shallow, as Turnip seed is very small. It, however, is sure to germinate well, therefore does not require to be sown thickly. One of the best varieties to sow now is Chirk Castle Black Stone. It is a hardy variety, and has a dark skin. If on this account it is objected to sow Jersey Navet, a white variety of Yellow Finland, pale orange yellow.

**POTATOES.**—Though early for the general lifting, there will be some varieties that are sufficiently ripe to be raised. Choose a dry day for the operation, never lifting more in one day than can be dealt with in picking up, sorting, and placing under cover, excluding light from the tubers that are to be preserved for consumption. Seed Potatoes are better if allowed to become greened over. The small and useless tubers must be kept separate, boiling them as opportunity permits, and mixing with other food for pigs and fowls. This is a safer way than throwing the tubers on a manure heap to rot, where disease spores if present might be retained and again disseminated. The haulm should be carefully gathered up and burnt rather than be allowed to rot in heaps on the ground.

**CAULIFLOWERS.**—Seed of Early London or similar hardy variety may be sown on a sheltered border about this date, following with another later. The seedlings should receive frequent attention, adopting early thinning and pricking out either in a frame or on a protected border where they will stand considerable chance of passing the winter safely. Autumn sowing of Cauliflower is not so general as formerly, owing to many excellent sorts being well adapted for raising in heat early in the year, and growing on for planting out in rich ground in May.

**OUTDOOR TOMATOES.**—If strong plants are kept moist at the roots and well fed when the crop is fairly heavy, the bunches of fruit will swell readily to a normal size. Carry on the feeding until the fruits commence to colour, gathering the forwardest before they become fully ripe, and finish on a warm shelf. This will give an opportunity for the small green fruits to swell larger before they commence colouring. It is important that growth be kept thinly trained and the plants not allowed to choke one another by neglecting to remove superfluous shoots. Old yellow leaves at the base may be advantageously removed entirely, especially below the bottom fruits, and very luxuriant foliage partially shortened when it is necessary to more fully expose the fruits for the purpose of ripening.

**ONIONS.**—Tripoli Onions which should be soon now may include the Giant Rocca, Blood Red, and Lemon Rocca which are hardy, form bulbs of large size the following year, proving useful and indispensable for exhibition. Rousham Park Hero is also good for autumn sowing. A plot of good ground must be prepared in an open position, levelling and making it fine on

the surface. Form shallow drills 12in apart, sowing the seed thinly, and cover with fine soil. If the seed is sown carefully very little thinning will be necessary, and the Onions can stand the winter where they are thinning and transplanting in spring.

**SPINACH.**—A liberal sowing ought to be made of Winter or Prickly Spinach. Choose warm, rich and fertile ground in a good position, and sow in drills, which ought to be soaked with water first if the soil is very dry.

**LETTUCE.**—Where Lettuce will grow and stand the winter it proves of great value. Seedlings succumb mainly to damp in the winter time. If they can be kept dry and comparatively hardy they are able to withstand cold better. Sow, therefore, or plant out seedlings on a well-drained sheltered border, and thin, so that they do not touch one another.

**ENDIVE.**—Moderately large plants of Endive commencing to form hearts should be blanched either by tying the outer leaves together, inverting a pot over the plants, or laying a slate across. Plant out seedlings on a sheltered border, and hoe among advancing plants.—**EAST KENT.**

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bethy—Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**LEAVES OF PEAR TREES BROWN AND WITHERED.** (J. F.).—The twigs have the leaves in a brown withered state, presenting a scorched appearance, but hanging on the branches, the fruit being also more or less browned and shrivelled. The affection accords with the Cherry leaf scorch, caused by the parasitic fungus named *Gnomonia erythrostoma*, occasioning the disease which every now and again proves destructive to the Cherry crop in various parts of Europe, and in recent years has proved disastrous to the crops in some Kentish orchards. There are some dark spots on the dry shrivelled leaves of your specimens, and evidently accord with the places where the conidial condition of the fungus has been produced at an earlier stage in perithecia seated on the discoloured spots. This condition usually occurs at the second or third week in June, the long, slender, colourless, curved conidia or summer spores being discharged and infect neighbouring parts of the trees, the affected leaves withering and remain hanging on the tree. During winter, the ascigerous form of fruit of the fungus is also produced on dead hanging or fallen leaves, and the spores from these start the disease anew on the young leaves in the early part of the summer. In order, therefore, to avoid infection, all the dead, infected leaves hanging on the tree or fallen, should be collected in autumn or early winter, and burned. This must, to succeed, be general throughout the infected district. Where this method has been carried on for two seasons the Cherry crop and also that of Pears, which has been completely ruined, is restored to its former productiveness. The bark and wood of the twigs or small branches appear quite sound, but the growths are very stunted, and the ends extremely weak, due, no doubt, to the collapse of the leaves. Soapsuds, unless used excessively, would not cause the destruction of the roots of the tree, and collapse from such would also have affected the wood.

**GRAPES NOT STONING (A. S. A.).**—It is owing to imperfect fertilisation. The atmosphere has been kept too dry when the Vines were in flower. A moist atmosphere should have been maintained by frequently sprinkling the paths, &c., when the Vines were in flower. We do not advise budding a Muscat on the Black Hamburgh, but you may inarch it now, or early next spring graft the Black Hamburgh with the Muscat. We do not think that will enable you to perfect the Muscats in a greenhouse. Why not plant Foster's White Seedling or Buckland Sweetwater? Either is better than the Royal Muscadine, and more suitable for a greenhouse than the Muscats.

**AMERICAN BLIGHT ON APPLE TREES (A Subscriber).**—The most effectual mode of freeing the trees is to wash them with water by means of a powerful syringe or engine. The insects will be washed on to the ground, and though incapable of further injury, it is well to remove them with a hoe, hoeing and raking the ground as far as the branches extend. If the roots are attacked all you can do is to remove the old soil to the extent of 6 in or 8 in, and for 2 ft or 3 ft from the stem, giving the roots a good washing, and replacing with fresh soil. The soil removed should be burned or taken a considerable distance from the trees. In autumn, after the leaves fall, the trees may be washed with paraffin oil, applying it with a brush to the parts affected.

**MEALY BUG ON GRAPES (Caution).**—As the insect has attacked the bunches, your only plan will be to tie the shoulders out, so as to make the bunches as loose and open as possible, and then you may with a small brush remove the insects. It is not only the bug, but the secretion—honeydew—that you will have to clear away, and that may be partly effected with water at a temperature of 120 deg, applying it with a syringe. To rid yourself of the pest without destroying the bloom and injuring the fruit to some extent is out of the question. When the leaves have fallen, you may then give everything a thorough cleaning, and had this been done before the Vines were started, and had the plants on the back wall been kept clear of the bug, the present state of the Grapes might have been considerably, if not completely prevented.

**TOMATO LEAF DISEASED (J. D.).**—Yes, the leaflets are affected on the under side by the white fly, *Aleyrodes vaporariorum*, in all stages, from eggs to adults. It is the larvæ that do the mischief by piercing the skin and sucking the juices, and the pupæ are also fixed to the leaves, and the insects emerge after a few days spent in the pupal state. The leaves occupied by them turn yellow, wither and die. The insect attacks the leaves in succession from the lower to the upper. It is rather uncommon for outdoor plants to be infected as well as indoor, the former probably having been infected when turned out outdoors, as in our experience these insects are unable to withstand exposure to the open air temperature of England. Under glass, the best remedy for this pest is, ecating the hot-water pipes whilst heated to over 170 degs with a cream of flowers of sulphur and skim milk, keeping the house closed and the pipes hot for an hour, then allowing them to cool down to ordinary heat, repeating this at intervals of about four days twice, or until the pest is annihilated. Spraying the plants on the under side of the leaves with tobacco water is also a good remedy, as also is dusting with tobacco powder. Vaporisation with nicotine compound destroys the insects, repeating occasionally. The leaflets are so affected with the Tomato leaf rust, *Cladosporium pulvum*, which is mostly confined to plants grown under glass in this country, and it follows the leaves in infection from below upwards. To contend against both pests we advise spraying with the following wash: Dissolve 1 pint of soft-soap in 1 quart of boiling soft water. Remove from the fire, and while still boiling hot, add half a pint of paraffin oil, and immediately churn the mixture with a small hand syringe. In five minutes a perfect emulsion will be obtained. Then dilute to 5 gallons with hot soft water, adding 1 oz of sulphide of potassium (liver of sulphur) previously dissolved in about a quart of hot water, mixing well. When cool enough, spray the infected plants, under as well as upper surface of the leaves, coating them with the finest possible film of the solution, and repeat twice or three times, at an interval of four days, so as to destroy the white fly as they hatch out.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (W. W.).—1, *Clematis viticella purpurea*; 2, *Sophora japonica pendula*; 3, *Catalpa syriaca*; 4, *Datura Stramonium*, the Thorn Apple. (G. C.).—Probably a *Lobelia*, but much dried. (J. Honiton).—*Gnaphalium lanatum*. (M. A. R.).—1, *Malva Crecana*; 2, *Lythrum alatum*. (Avoca).—A poor specimen of *Alstroemeria*.

## Feeding Stuffs.

This is the subject of an article in the Journal of the Royal Agricultural Society, and although it has been almost thrashed out before, there appears to be more than a little left for present discussion. The gist of the whole matter lies in the values given to the different constituents of the foods, and it is here where we may learn valuable lessons as to what should be the foods we buy. The three chief constituents of foods are albuminoids or nitrogenous foods, oil, and carbohydrates. The last are starchy, and in the digestible process sugary, and, therefore, fat-forming mediums. Oil is also fat-forming, but being more directly assimilated is less injurious to the constitution in proportion to the fat acquired. The albuminoids represent the lean meat portion of the diet, and these are the most important to young and growing animals. Fat and carbo-hydrates both represent heat, and when the weather is cold and shelter scanty these must be liberally supplied to all kinds of stock; but for growing animals the albuminoids are the most important. When full growth is attained, the fattening foods may usefully be increased to the utmost digestible capacity. It is here that linseed cake asserts itself, for there is no food of which an animal can consume so much and retain health. Wheat, Barley, or Maize meals are fine feeding stuffs, but not being so digestible as cake may easily be overdone. When they are used they should be strictly limited in quantity, and increased very gradually; whilst they should never be used except in conjunction with linseed cake. This rule is subject to one other exception. Meal may be used alone, in small quantity, to give a taste to a ration of cut straw or low class hay which is being fed to poor backward drapes or bullocks which would not pay for a more expensive ration until they get into a more thriving condition.

Those graziers who use the greatest amount of foresight in attempting to get a profit on their grass, buy their cattle in late autumn or early winter, when markets are full. They are not particular as to condition. A good bill of health and a low price are indispensable. The animals' heads must not before grass time be swollen, metaphorically, to such an extent as to leave no room for profit. Therefore the expense of wintering must be kept low, and the smallest possible quantity of bought food be used. It is here that grain meal is so useful, because such a small quantity suffices to give a lick to any coarse food which may be available. This, of course, only applies to animals of mature age which have got into low condition. The starch in the meal moderately used represents the cheapest form of heat production for the purpose. If you have cattle in an improving state, that is what dealers call "fresh," they will pay for a more expensive diet, as well as a more generous one, and it is then that you will have the greatest need for care in the choice and proper mixture of the various constituents. As the ration is increased, we must keep digestion closely in view, and the increase must be chiefly in the most digestible portion. Therefore the grain meals, whether they be of Wheat, Barley, or Maize, must be increased in very slight degree, if at all, and the additions to the cake proportion consist principally of linseed.

There is one, and a serious, objection to the lavish use of linseed cake, and that is, that although it is a most useful, and we might also say indispensable, food for stock, it is a relatively dear one. It is the very safety and reliability of it which creates a strong demand and a more or less artificial value. But there are other alternatives to the use of linseed cake. A very large number of farmers have a strong prejudice against decorticated cotton cake, because it is very hard and difficult to break; but as a ton of decorticated cotton is as good as a ton of linseed cake as a food, and

superior to it in its manurial value, these farmers are standing in their own light when they allow such a small difficulty to stand in the way. Manufacturers have essayed to conquer old prejudices by putting decorticated cotton meal finely ground on the market. As it is, or rather should be if good, very rich in oil, it is most suitable to give to either growing or feeding stock, and a small quantity would be an excellent substitute for Maize, Wheat, or Barley meal used to give a taste to common fodder. Good decorticated cotton cake may contain as much as 15 and 16 per cent. of oil, and it has a decidedly laxative effect on the bowels, so is not suitable for consumption on grass, but as part of a combination of meals and cakes it makes a very efficient substitute for the linseed cake which costs 20s. to 25s. per ton more money.

Farmers must remember that it is the hardest kind of decorticated cake which contains the most oil, and soft cakes which are easy to break may be of far less value. We have made extensive use of decorticated cake, and generally put it through the breaker twice even for cattle. Decorticated meal is a little lower in price than the cake, and also saves the labour of breaking; but, as a rule, it does not analyse so well. Perhaps the mill is useful in hiding impurities. It is also unsuitable to give by itself, but is most useful to mix with cut meat or chaff for cattle. For sheep there is the objection that it is wasteful in windy weather unless the chaff or chop is well damped before the meal is mixed with it. If a regular supply of chaff is given to sheep, an equal allowance of decorticated cake or meal and malt culms, say  $\frac{1}{2}$  lb of each per head per day, forms the best addition in our opinion for use in the Turnip fold. The cost is moderate. It is a good food, whilst the residual value is the highest possible in proportion to the cost.

As soon as you increase your ration of concentrated foods, a proportion of linseed cake must come in, and for heavy feeding a variety in combination is absolutely necessary. Three pounds per head for bullocks,  $\frac{1}{2}$  lb for sheep per day is as much as should be given of any one food for winter feeding. It is quite different when stock are on grass in summer, when an allowance of 14 lb per bullock is not at all uncommon, and often most profitable.

## Work on the Home Farm.

There will be no harvest on the 20th, which was the date we had fixed. If the present cold and wet weather continues we may be almost in September before we begin. On two mornings recently there was something very like a frost on the grass at sunrise. Cloudy skies and cold drizzling rain are excellent for the aftermath and root crops, but not so for the corn. A month of real summer is badly needed now. It will be a thousand pities if such an excellent prospect is ruined for want of sunshine.

Wheat stands up well and Oats generally also, but much Barley has been laid and twisted about lately, so farmers are wondering how the binders will work. It is some time since they were set such a task. As a fact, this is the first severe test to which some of the newest machines have been put. Much more manual labour will be required this year, and regular Irish visitors are being invited to bring others with them. As the Potato harvest will follow closely after the corn stacking, there is the more inducement for Irishmen to come over.

The August fairs have commenced, and so far they have been decidedly slow. Prices are fairly high, but little trade has been done. Notwithstanding the plethora of keeping, and the prospect for roots, there are more sellers than buyers amongst farmers. Money is very scarce indeed amongst them at present, but as soon as thrashing begins we expect to see a boom in the sheep trade. Lambs from 24s. to 34s., and gimmers for breeding at 40s. leave plenty of room for profit at Michaelmas. Clover are a fine plant if the crops are not smothering them, and sheep will be wanted as badly next spring as in the autumn.

Some of the Turnips require another skerrying which they will have at the first dry opportunity. They may require a little more weeding, but the later Turnips have been singularly free from weeds this year. There has been too much work of that kind amongst Mangolds and Swedes. Both crop and weeds grew so rapidly after the striking out process that the final cleaning has been difficult. Piece-work men lost by the cleaning everything they had gained by the hoeing, and they complain that they have not made day wages. They should be able to demand a good harvest month to make matters straight. We are having the saddler and his men to repair the gearing, now the horses are taking a rest.

### Using Artificial Manures.

OF late years gardening has made wonderful progress, but in one thing gardeners have lagged behind, namely, in knowledge of the use and application of artificial manures. The various mixed garden manures and special fertilisers offered by the different firms are of great value, but they partake a little too much of the quack doctor's cure-all. The numerous plants a gardener has under his charge have very different requirements, and a study of them is not only profitable but extremely interesting. Speaking broadly, farmers know what special fertilisers their crops require, then why should not gardeners? All plants require mixed manures, but in the mixtures for Wheat, Oats, and Barley, and plants of the same class, nitrogenous manures predominate; for Turnips and Swedes, phosphatic manures; for Potatoes, potassic and nitrogenous manures; for Clovers and Leguminous plants, phosphatic and potassic manures; for Mangolds, nitrogenous manures and salt, and so forth. If gardeners had their crops roughly mapped out in the same way it would be advantageous to them.

The matter is not, however, so simple as looks, for even in manures of the same class there are great differences. Take the two nitrogenous manures in most regular use, namely, nitrate of soda and sulphate of ammonia. Although they supply the same kind of plant food, namely, nitrogen, they often act in a widely different way. Sulphate of ammonia, though the richer of the two, is much slower in making its presence felt, and its specific action appears to be to develop the flower and seed. Nitrate of soda, one of the quickest manures at our disposal, on the other hand, appears to develop the leaf and stem. Herein, then, is room for great diversity

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

in practice. Plants may be assisted or damaged by the manure used according to the purpose for which they are grown. Nitrate of potash, better known as saltpetre, is a quick-acting, valuable manure when applied in small quantities. It supplies not only nitrogen, but potash, two elements of plant food often deficient in soils.

The best general artificial manure is genuine Peruvian guano. It contains all the different kinds of plant food usually lacking in soils, and in such form that they become available as the plant requires them. In poor or worn out soils it is a manure that can scarcely come amiss. There is great choice amongst phosphatic manures. Bones, raw, dissolved, boiled, and steamed; mineral superphosphates; basic slag; phosphatic guanos, and others. Ground raw bones are slow in action, but promote healthy growth; dissolved bones are quicker, but do not usually give such sturdy growth. Steamed bonemeal and flour are intermediate and valuable. Mineral superphosphate hastens the maturity of plants, and gives bright, clean growth. Basic slag is the slowest of the lot, and, containing a large percentage of free lime, is excellent on sour soils; in these it neutralises the acid vegetable matter, and induces healthy growth.

Potassic manures include muriate of potash, sulphate of potash, and kainit, the latter being commonest and cheapest. Wood ashes also contain a considerable percentage of potash. Potash is said to assist in the formation of starch, hence its value. It is usually on light, sandy soils that this class of manure is most effective, clay soils being comparatively rich in potash. There are, under these, many manures that cannot be mentioned in the space at disposal.

There is one more aspect of the question to be briefly discussed, namely, Have artificial manures, or chemical substances, much influence on the colour of flowers? We know that iron gives us blue Hydrangeas; manganese is said to deepen the tint of blue flowers, and generous feeding brightens the colours of some others. Beyond this our knowledge is circumscribed. It is, nevertheless, an interesting question, and deserving of more inquiries and experiments than have yet been extended to it. If these few remarks draw attention to artificial fertilisers, they will have served their purpose.—W. P.

## Rambles in Switzerland.

Not being gifted with either Musel's cloak or Fortunatus' hat, I had to pass over some seven hundred miles of land and sea before I reached the point where I was to be introduced to "the Merry Swiss Boy" and his surroundings. Now, that boy is no common boy, and he cannot be a common boy—of course I speak of a generation, not of an individual—who is born and passes his life in such a mountain land. I will not pause to argue over the why and because, but I rest upon the fact that the people of the mountains are everywhere superior to the people of their neighbouring lowlands, both mentally and physically. The Dutchman has a large posterior development, but the Swiss has a muscular leg and arm and an elevated cranium. Look at the clusters of Swiss boys, each with his knapsack, passing on, morning after morning, from every point of the compass to the canton-sustained school of the district; and from these clusters you may deduce another evidence—universal education—why a Swiss is intelligent and free.

I certainly feel equally free of pen, for when I dipped mine into the ink it assuredly was with no intention to dwell upon Swiss boys and their education, but to have made no pause until I came to my recollections and notes of Zurich. Well, here I am beneath the trees at the end of the garden of the Baur au Lac, and looking upon the lake's blue water and its bright green, villa-dotted banks. There are three English ladies and one Swiss lady near me; and this one last-named reminds me that the girls and women of this land are also physically and intellectually superior to the females of lowland countries. Let one instance suffice. A Swiss lady, evidently a governess commencing her annual holiday, was in the same railway carriage with me. We crossed the Channel together, went on to Paris together, and there I

thought that mind and muscle demanded rest; but not so my companion. The Ranz de Vache had a spell over her, and on she went to travel without a resting over some more hundreds of miles, until she had reached the land of her birth. Well, God speed her! But before I pass from the remembrance of her fair face, and mind as fair, let me record that it is a delusion to believe that a Ranz de Vache is one especial and universally accepted melody. Every district has some favourite air, and that is its Ranz de Vache.

And now, if I can restrain my thoughts from further vagrancy, let me dwell upon subjects more consonant with the special topics of your pages. No, it cannot be; for I must jot down first something about that John James Scheuchzer whose "Itinera Alpina" is the first published of Swiss guide books—and a strange book is it. He was a professor at Zurich, this very place where my Swiss notes begin. Some ignorance of the district around does he betray, yet both he and his brother John—rare fraternity in science—were superior botanists. John devoted himself especially to the study of the Grasses, and John James to the study of alpine plants; and they are most aptly commemorated by the genus Scheuchzeria, for its solitary member is of grassy habit and of alpine birth. John James was a native of Zurich; he was its special physician, its professor of mathematics, and there he printed and published nearly all his numerous and voluminous works. Most of these works have one peculiarity—wherever an engraving could be possibly introduced, there one, however irrelevant and unneeded, is introduced. Thus in his "Physique Sacrée," or Natural History of the Bible, having occasion to quote the Psalm, "Who can endure the cold of the Lord?" is inserted a picture of about twenty men who suffered severely in the ice; and an allusion to some coin enabled him to add engravings of medals he had collected! Peter the Great endeavoured to lure him from his native land, but the Senate of Zurich prized Scheuchzer too highly to permit his departure. They bestowed upon him honours and stipends, and thus detained him until he died in 1733 among his fellow citizens.

His "Itinera Alpina" does not differ from his other works in having numerous illustrations, and the most interesting is his own portrait. An inscription beneath each reveals that they were added at the expense of his friends, and it startles at first to find that our Sir Isaac Newton thus contributed some, and that the portraits of plants were paid for by our botanists Bobart, Lhuyd, and Dale. With no faint interest did I examine the specimens collected by the Scheuchzers, preserved and labelled in their own handwriting, in the herbarium attached to the Zurich Botanic Garden. This garden was established in 1560 by him who has been well named "the greatest naturalist the world had seen since Aristotle," Conrad Gesner. His collection of dried plants has been mentioned as preserved here; but it is not, nor could I learn that it had been ever, deposited in any of Zurich's public museums.

This town, like our Norwich, has been fertile of botanists, besides many high masters of many other sciences; but I will dwell only upon one other, who, like Gesner, was one of the most lovable of men—Lavater, the physiognomist, who needs no other testimony than that he would not reveal the name of his assassin, and, perhaps, it is an evidence that his countrymen think he needs no eulogy, that there is no other epitaph over his grave than this, in the obscure churchyard of St. Anne:—"J. C. Lavater's grave. Born 15th Nov., 1741. Died 21st Jan., 1801." I might not have noticed this true personal illustrator of charity, had not I long pondered over the physiognomy of organised forms which Lavater has left unnoticed—plants. They have had, however, their Lavater, for Humboldt wrote "Considerations on the Physiognomy of Plants"; but he and his disciples have confined their comments to the features imparted to a country by the plants which are there specially predominant. The Palmæ, Musacæ, Piperacæ, and Scitamineæ impart a physiognomy to the tropics, totally differing from that imparted by the Abietinæ of northern latitudes. But we might, I think, go some steps further; might detect the internal qualities of plants from their physiognomy. When we see a plant having the form of a Grass, whether it be a pigmy, as the Poa annua on our gravel walks, or 50ft high, as in the Bamboo, we know that starch predominates in its seeds. Again, in the large natural family of the Rosacæ, is there one fruit that is unwholesome, or one that does not contain malic acid?—W. J.

(To be continued.)

**Lælio-Cattleya × Adolphus superbus.**

Our illustration this week presents a very attractive big-neric hybrid, whose merits secured for it a First Class Certificate at the Royal Horticultural Society's meeting in the Drill Hall on August 5. Messrs. Charlesworth and Co., Heaton, Bradford, were the exhibitors. The flowers are of waxy appearance, and the sepals and petals of a bright reddish-orange colour. They are further spotted with ruby tint, and the lip is purplish-rose on the side lobes and at the tips, and there are lines of yellow on the disc. The parents are *Lælia cinnabarina* and *Cattleya Acklandiae*, and the hybrid takes after the latter in general habit.

**Liquid Manure for Orchids.**

Liquid manure is not generally given to Orchids, but it is a question if great numbers would not be benefited if it were. Peat is too much used under the mistaken impression that it yields something beneficial to the plants. We do not say that peat should never be used in Orchid culture, for we know that great numbers require some such material; but we feel assured from experience, that great numbers would be much better without. All Orchid growers admit that decaying peat is an evil; but few seem to understand that only decaying material can yield plant food. A friend, who has on more than one occasion brought us plants from the East Indies and elsewhere, tells us that all the good roots he has seen on Orchid plants in the wild state were either attached to fresh hard bark, or growing among living vegetation, or dangling in the air. He also assures us that many, or most of the kinds which grow on trees, are fed with liquid manure naturally. He has almost invariably found the branches of the trees bespattered, often plentifully, with the excreta of both birds and mammals. This is washed by rain within reach of the roots of the Orchids, and we cannot doubt that they are thereby benefited. Is not this a hint worth thinking about? Orchids, however, are not to be tampered with, but we are sure that weak liquid manure applied to those plants which have filled their pots or baskets completely with healthy roots helps them greatly, as in the case of *Cypripedium insigne* and many others.—A.

**The Dendrobium.**

The genus *Dendrobium* is deservedly one of the most popular in the Orchid family, containing as it does, a very large number of exquisitely beautiful species, usually of easy culture and presenting a flowering return when compared with their size far in excess of most other kinds. Many, indeed, are quite indispensable in collections, every known species is worthy of culture, and every month in the year is graced by their lovely blossoms.

For cultural purposes one may almost group the species under four headings. The first would be the deciduous sorts, of which *D. Wardianum*, *D. crassinode* and *D. Bensoniæ* are well known examples. The evergreen sorts such as *D. densiflorum* and its allies would form the second group. *D. fimbriatum* and others of the nigro-hirsute section would form the third, while the fourth would consist of the Australasian sorts generally, as *D. bigibbum* and the lovely *D. phalaenopsis*. But although these sections of the genus are fairly distinct, the species in some cases overlap and run into each other, so to speak, yet it is, perhaps, the best that can be done in the way of classification.

The first section require a great amount of sunlight, heat, and moisture to encourage, develop and properly consolidate the long cylindrical stems that are their characteristic. Very few of them have any liking for a great thickness of compost, but all delight in having their roots crowded together in very small receptacles. I have had *D. Wardianum* in small pans and halves of cocoa-nut shells grow over a yard in length, with stems of good thickness throughout, that in their season were wreathed with the lovely blossoms and strikingly handsome.

Clearly then, it is not the amount of compost they need to make them satisfactory. But firmly fixed they must be on the home of their adoption. There must be no rocking about in the pans, or the roots will not be able to take hold of the compost, and the plant will be weakened. It is best to tie them firmly to stake the first season, and allow the growths made to attain their natural horizontal, pendant or upright position, according to the habit of the individual species. Then when these root in their turn, the whole plant will be naturally and firmly established. This may seem to many a small matter, but only those who have had a few years' experience know how imperative it really is.—H. R. R.

## Indian Mangos.

During my latest visit to England I noticed articles about Mangos in the newspapers, and I saw some fine fruit of a good Bombay variety (Peary or Peter) in a shop near New Street Station, Birmingham, priced 4d. each. This fruit would cost that in Bombay market. I also heard of consignments of fruit being sent from Bombay, but I never knew if the venture was profitable or not. I think the ordinary English fruit eater is tempted more by the cheapness of a new fruit than by its looks, and very few would give 4d. even, except for curiosity, and a Mango being a fruit most difficult to judge of the stage of its ripeness, the probability is the buyer would not waste another 4d. on such fruit. On the other hand, he might perhaps get a really good one, and if he did he would never forget it. It will be a long time before Mangos can be landed in England for 1d. each. That is about the price paid in Mango districts here in India, six rupees a hundred. With Mangos all depends upon the stage of their ripeness. If too ripe, a rotten Turnip is better; or, if too unripe, the "tow and turpentine" is predominant. They are even worse than Melons to judge of the proper stage of ripeness in which to eat them, and one day too much or too little makes all the difference in

**Lælio-Cattleya × Adolphus superbus.**

flavour. Then again England, except on very hot days, is not the country to eat Mangos in. A hot day, about 90deg in the shade, and a fine ripe Mango just taken off the ice after breakfast, in the morning, is a thing one will never get in England as we do in India. So the Mango stands a poor chance of ever becoming a favourite in Great Britain or a profitable fruit to send; and until the vendor of the fruit knows exactly when as to ripeness and what variety to sell his customers, the chance of the Mango is, I fear, not much.

There are many people, however, living or travelling abroad who would like to know the names of the best varieties. The following list may also conjure up pleasurable remembrances in many readers in England, old residents in India, who had their garden and favourite Mango tree.

Mangos in India are propagated by inarching, which is the best method when properly done. It does not matter much with the native gardener if a bit of string is left on or two inches of "snag" is left to grow over. One of his reasons for having a "graft" is because it "bears better." The "bit of string," or the rotten end of the stem, is not taken into consideration. Grafts made as they are made here would never live in England; but in this country Nature repairs a lot of bad carpenter's work in the way of inarching, and even from Government gardens, where professional Europeans superintend the work, the "grafts" are just as bad as it is possible to make them. Seedlings give good results if seed is properly selected, and I would advise intending planters in the Colonies to import fruit and sow the seeds in layers, in trays of soil, instead of buying "grafts," which in some localities are "made specially" for the market, and consist of two seedlings tied together. Verily the ways of the native gardener "are peculiar."

The general idea in India amongst Europeans about Mangos is that there are four good varieties—Bombays, Maldahs,

Lengcras, and Budays. These names really mean four large classes of fruit, and the sub-varieties of each are endless. I myself collected over 500 varieties in Durbhungah, in North-West Bengal, one of the homes of the Mango. The Budays are of all shapes, and ripen in the month of Bhádon, the fifth month of the Hindu year. The Budays are very little known, and are seldom seen in the bazaars. One of the best, named "Fuzhe," can be bought in Calcutta in September, sometimes at about 8d. each; it is a large, fine fruit, weighing often 2lb each. Most of the good varieties of Budays fetch from six to ten rupees per 100 in Durbhungah Bazaar, where they are plentiful.

Some of the terms used in my description of the fruit are curious. "Nák," or nose, is the native name for the point where the pistil was situated on the young fruit when it was in the flower, and where also the root comes out of the seed.

During my seven years sojourn in Tirhoot, the "Garden of India," I collected all the finest varieties of Mangos in India, most of which were planted in the Maharajah of Durbhungah's grounds. The Mango season lasted for five months. We had one variety, a perpetual bearer, called "Baramassia," or the "Twelve months" Mango, always flowering and fruiting, but it was of very inferior quality.

Mangos in damp, wet countries grow best on mounds. They will also grow, it is true, in a swamp, but raised ground well drained is best. In dry, hot places you cannot irrigate too much during the hot months, always drying them up for three or four months after the rains, if possible. I have often seen fruits hanging on the tree with a root hanging out of the fruit, having germinated as it hung.

Most of the good varieties are accidental seedlings. No attempt has been made in the selection of seeds, except in Durbhungah. I left before I saw the results of experiments made there, and am afraid no one cared to keep up the experiments. Akbar, the great Mogul Emperor, and his generals did a great deal to plant India with Mangos. So says an old Mahomedan gentleman, a friend of mine. There remain still near Durbhungah many trees of what is called the "Lac Bagh," or the garden of one hundred thousand trees. Those I saw were 4ft to 5ft in diameter—immense trees 45ft apart. Akbar reigned 1556-1605, and he left his mark in Mango gardens all over Northern and Central India, as well as on the coins. What a difference this to the temper of people nowadays! Most people would say: "What is the use of planting trees? I shall never see them grow up and fruit." But all the same, they are thankful for these lovely, shady groves Akbar planted, particularly when they are in camp on a hot day.—C. MARIES, F.L.S., V.M.H. (in "Journal of the Royal Horticultural Society").

## Notes on Conifers.

I have given in previous articles a short description of the Conifers that are known to me, or, rather, those which I have had actual experience with. I should now like to make a few remarks upon planting. We have a long season in which this operation may be performed, viz., from September to April. This is both earlier and later than some recommend; on the other hand, I have heard it said that the two months just named are the best for this purpose; but so much depends upon circumstances. In a general way, however, from early in October to the end of March is a very good time, and this will give us half the year in which we may plant, providing the weather is suitable.

A few years ago I transplanted a number of rather large specimens about the last week in April, it being very warm and dry at the time, and some of the trees had to remain out of the ground a day or two; but the roots were carefully protected. As soon as they were planted a good soaking of water was applied, and several times subsequently, with the result that all grew; they are now healthy specimens. Perhaps it is only fair to say that the majority of them were good trees to deal with, most of them being *Retinosporas* and *Cupressus Lawsoniana* in variety. Where it is simply a case of planting home grown trees, the operation may be safely performed all through the month of April, especially if a little attention is paid to them in the matter of watering. The danger of late planting comes in when the plants have to come from the nursery, and remain several days perhaps out of the ground, and the roots get very dry. In such cases it is a good plan to dip the roots in water before planting. April is often a better month for planting than March;

during the latter month we often experience very cold and drying winds. This is very unfavourable weather, not only for Conifers, but for planting in general.

Some authorities consider autumn the best season to plant, and in the case of deciduous hardwood trees I have found it to give the best results. With Conifers, however, I have had equally, if not better, results from spring planting, an instance of which has already been mentioned. One great drawback to autumn planting is that the soil is often very dry at that season. It has been notably so of recent years after the very hot and dry summer. Some two years ago I wanted to transplant a few large specimens of *Retinospora plumosa*, but found the soil so very dry that the work could not be done without a great deal of labour. Where it is really necessary to plant under such conditions, a few good soakings of water should be given the trees a few days previous.

Although Conifers may be planted at any time during the winter, weather permitting, I think they do not stand so good a chance as those planted in early autumn, or in spring. In the former case the soil is warm, and the trees become somewhat established before the cold weather sets in; whilst those planted in spring will also be safe from severe frosts. When planting takes place in winter, and is followed by a long spell of frosty weather, the trees are often much injured, and sometimes permanently disfigured.

After it is decided when to plant, it is not always an easy matter to arrange where to plant. The difficulty is not so great, perhaps, in planting single specimens, as it is when a border, bed, or groups have to be taken in hand. In the latter case, much care and forethought are needed, or very likely when the trees are grown up and require thinning, it will be rather difficult to decide which to remove. A little time spent in preparing a plan is not wasted, and will often prevent a great deal of bother later on. When planting a border, or bed, the kind of trees that are intended to occupy permanent positions should be decided upon, and suitable positions marked out to receive them. When these are put in, others may be planted amongst them, to give a more furnished appearance to the bed. Planted in this manner, there should not be much difficulty experienced when thinning out requires attention.

Holes large enough to receive the trees should be made, so that the roots may be laid out their full length, and not cramped up, or turned upwards, as is sometimes done in planting trees. Very often most of the roots will be on one side of the stem, especially if they have not been frequently transplanted. When this is so, some of them should be carefully brought round as far as possible without injuring them, so that the tree may the sooner become established. It is a good plan to put the strongest roots to the most exposed side; by this means the plant will be better able to stand against the strong winds.

In planting large specimens, it will often be found necessary to stake them, especially those having small roots in proportion to top growth, such as many of the Pines and Firs. The best way to do this is to drive a stake well down in the bottom of the hole. In planting put the stem of the tree up against it, and secure the two with strong tar band. Some protecting material should be put between the stake and the stem. The former need not be more than 2ft or 3ft above the ground line, according to the size of the tree. There is nothing unsightly in staking trees in this manner, and they will last until the trees become firmly established. A good watering should be given, especially when planting in spring, and should be repeated several times, according to the state of the weather. A mulch of litter or lawn mowings is very beneficial during the summer, although it may be considered untidy.—PINUS.

## The Hops.

The Hop crop is unsatisfactory, and the prospects grow less and less reassuring as the season advances. The longer the sunshine and genuine warmth are deferred the poorer become the chances of a full and valuable crop. The cold weather in May and June settled the fate of the crop so far as the weight of the yield was concerned. The hopes of the growers are now centred on the quality of the fruit, but present appearances are by no means reassuring. The aphid blight has also contributed to make the situation worse. The market will probably be favourable to the seller, especially if the Hops are of good quality.

## NOTES

## &amp; NOTICES

**Death of Mr. James Parr**

The death took place at Rose Cottage, Barton, August 15, of Mr. James Parr, who has for several years been secretary of the Patricroft Linnæan Society, and who as a botanist was well known throughout the district. He was a large grower of Chrysanthemums.

**A Visit to Swanley.**

Sir J. Leige Hulett, Speaker of the Legislative Assembly of Natal, and Lady Hulett, paid a lengthy visit to Messrs. Cannell and Sons, Swanley Nurseries, recently. They were intensely interested with what they saw, and left an order to be despatched at once. They propose having a visit to the firm's Eynsford Nursery later on, and making an exhaustive examination before leaving for South Africa.

***Arnica montana.***

The deep orange-yellow flowers of the midsummer flowering border perennial are always a source of attraction, and, judging from the specimens sent in to us, it is considerably grown, but not generally identified. The height of the plants does not exceed 2ft, and the growths terminate in solitary composite flowers. Its culture is of the simplest, and one established in any friable soil. We have not experienced any lack in its vigour or alteration in its general freedom of habit. An illustration is afforded on another page.

**Carnations from Swindon.**

Messrs. Davis and Son, nurserymen, &c., Bath Road, Swindon, have forwarded to us a boxful of Carnation and Picotee flowers. We will not trust ourselves to apply names to these Florists' Flowers, but we can, at all events, admire and commend the quality of most of the blooms before us. In nearly all cases they are firm, fragrant, deeply coloured, full and evenly built, and of good size. The light-edged Picotees are specially tasteful. The collection otherwise includes selfs, yellow-ground Fancies, flakes, and fringe-edged selfs.

**Cardiff Gardeners' Outing.**

The members of the Cardiff Gardeners' Association held their annual outing to Highbury, Birmingham, the seat of the Right Hon. Joseph Chamberlain, M.P., on Monday, August 11. The party, numbering sixty, left Cardiff in saloon carriages at 6.25 a.m., reaching Ye Old Royal Hotel at 12.30, where an excellent dinner was in readiness, and was thoroughly enjoyed. The toast list was a brief one, the loyal toasts being given by Mr. F. G. Treseder, who presided. The next toast was that of the Right Hon. Joseph Chamberlain, M.P., submitted by John Julian, hon. secretary, who said how deeply indebted they all felt to that gentleman for his courteous consent to their visiting his beautiful place. The "Cardiff Gardeners' Association" was submitted by Mr. Bishop, and responded to by Mr. C. E. Collier, chairman; Mr. Thos. Malpass, hon. treasurer; and Mr. John Julian, hon. sec.; and that of the "Visitors," "Chairman," and "Host" followed. A move was then made to Station Street, where a special steam tram was in waiting to convey the party to near Highbury. Messrs. Deacon and Mackay were in waiting at the entrance to escort the members round. The contents of the numerous Orchid and other plants and fruit houses were greatly admired, as was also the beautiful pleasure grounds, such a spot as one may well imagine that Mr. Chamberlain so much enjoys in quietude when not so greatly occupied with State affairs. Mr. Deacon referred to the lateness of the season, and certainly various subjects showed that they had not been favoured any more in regard to sunshine than we had been in our own neighbourhood. On completing the tour round the gardens, a vote of thanks was accorded Messrs. Deacon and Mackay for their courtesy. The party then made a move to visit their friends in town, leaving Birmingham at 11.30, and reaching Cardiff at 4.30 a.m. Tuesday, having enjoyed one of the most successful outings the Association has ever had.

J. JULIAN, Hon. Sec.

**Peaches from Byfleet.**

A contribution of Peaches, which has become an annual offering, reached us during the week from Mr. G. Carpenter, The Gardens, West Hall, Byfleet, Surrey. The fruits were nicely flavoured, and betokened careful culture.

**The Victoria Regia.**

A specimen of this at the Botanical Gardens, Old Trafford, Manchester, is at present showing leaves 7ft in diameter, and the curator has been creating a local sensation by taking his position upon one of them, seated in a chair. Of this the "Daily Dispatch" publishes an amusing illustration.

**A Mysterious Insect.**

In the Canton of Tessin, known as the fruit garden of Switzerland, thousands of fruit trees have been destroyed by a plague of parasites. The orchards at present look like withered forests, as all the fruit trees have been eaten up by this unknown insect, which first introduces itself into the leaves and appears to live on the sap of the tree. All remedies have proved unsuccessful in destroying the insects, and once attacked the tree is doomed. Many fruit growers have been ruined this year, and the plague seems to be spreading to the neighbouring cantons. The local authorities have invited experts to make a report as to the nature of the insect, and to find a remedy if possible.

**A Brazilian Botanist.**

Professor Barbosa Rodrigues, director of the Botanical Garden of Rio de Janeiro, has arrived in England. The Brazilian Congress has voted a considerable sum for the printing of his work, "Sertum Palmarum," in which he describes 160 species of Palm trees, entirely new, and discovered by himself in his journeys in the interior of Brazil for more than thirty years, the letterpress to be accompanied by large coloured plates drawn in the places where each species grows spontaneously. Senhor Barbosa Rodrigues has been received by the authorities at Kew Gardens, and has been asked to look over the classification of the living Palms in the hothouses as well as that of the exsiccata. In the course of his examination he discovered a hitherto unclassified species, brought from Goyaz in 1892, which he named *Astrocaryum Kewensis*.

**The Leeds Parks.**

The Leeds Corporation have just completed an interesting competition amongst the park gardeners, which, so far as is known, is entirely novel. The idea will serve to direct greater attention to the magnificent displays to be found in so many of our public parks, and the occasion may also act as a reminder of the enviable position which Leeds occupies in the matter of park equipment, a position which may almost be regarded as unique. In the city there are no fewer than twenty-two parks and recreation grounds, averaging about three to every ward. In the aggregate, the land acquired in this manner extends over an area of over 1,200 acres—more than a twentieth part of the area of the entire city—though about 350 acres are utilised in other ways. Including the £10,900 given by Colonel North in connection with the acquisition of Kirkstall Abbey and grounds, the actual cost of this immense area, from the purchase of Woodhouse Moor, so long ago as in 1857, to the opening of the parks at Potternewton and Harehills last year, is, in round figures, nearly £500,000.

**The Yorkshire College.**

The authorities of the Yorkshire College, Leeds, have issued a nicely got-up and beautifully illustrated brochure on agricultural education in Yorkshire. Judging from the letterpress and illustrations in this booklet, the agricultural department of the Yorkshire College is excellently equipped with buildings and stock. The course of instruction given at this centre has been well designed, and is of an eminently practical character. The County Councils of Yorkshire have made liberal provision for supporting agricultural education in Yorkshire by means of scholarships for selected students at this college. The course of dairy instruction at the college is also well looked after, and, as now arranged, any Yorkshire students who desire instruction beyond that given in butter-making at Garforth may attend the classes at the Midland Dairy Institute, while, conversely, any students from the Midland Dairy Institute who want short courses in agriculture can come to the Yorkshire College. The Yorkshire College undoubtedly possesses great advantages as a centre of agricultural education.

## An Evening with the Microscope.\*

(Continued from page 128.)

The microscope is used more or less in almost every branch of science; in fact, it is unquestionably one of the grandest scientific instruments ever invented, and we find the makers catalogue their different instruments suitable for physiology, pathology, bacteriology, zoology, biology, botany, brewing, chemistry, agriculture, petrology, metallurgy, engineering, &c. From a gardening point of view, the wide field of study in the various forms of either plant, fungus, or insect life is far too extensive to thoroughly explore, except by a specialist, as the practical gardener's duties, as a rule, are far too onerous for him to afford to devote any great amount of time to this hobby. Still it is very desirable that all should have some knowledge of the uses of the microscope, and the advantages of the same for gardening purposes.

In ordinary practice, as I have already stated, the pocket lens is sufficient for our requirements, as with it the gardener can examine the construction of the flowers if he wishes and classify them in their various natural orders; or he can find out the presence of his enemies, the insects, in their early stage, and thus adopt remedies before they have too well established themselves to prove too injurious to plant life. But for the examination of the structure of the growth of trees and plants, or the analysing of insect life, something more than an ordinary pocket lens is necessary. To examine the beautiful composition of growth, for instance, whether in cross or vertical sections, or whether transverse or longitudinal ones, a microscope fixed on a firm stand becomes absolutely necessary. It is desirable that the stems of such subjects should be perfect, and also small in dimensions, or otherwise cut into segments to show the perfect growth, i.e., the outer and inner bark, the medullary rays, the pith, the ducts, woody fibre, &c., so that the full composition of the stem is secured on the slide. To give a list of all plants or trees suitable for mounting, and which gives a great variety of construction and interest, would be simply to write out a long catalogue, as the whole of plant life is suitable for microscopy. I may, however, mention the common Lime, Clematis vitalba, Black Pepper, Chicory plant, Cebœa scandens, Aristolochia, root of the Thistle, root of Aërides, stem of Pteris aquilina, leaf stem of Cycas revoluta, Bamboo, Sugar Cane, stem of Nettle, leaf stem of Nuphar lutea, and hundreds more make very good examples for the microscopist, whether mounted in vertical or transverse sections.

The pollens of flowers when viewed under the microscope are very beautiful and interesting. Probably none are more so than the Hollyhock, Marsh Mallow, Arum, Poppy, Cebœa scandens, Sunflower, and that of the Scotch Thistle, for although hundreds more could be added, comparatively few are beautiful. Seeds when mounted as opaque objects are also well suited to the microscope, but do not give so wide a field of variety and interest.

So, likewise, Fern spores, whether mounted, covered, or uncovered; also the peristomes of many Mosses, furnish some very beautiful subjects. The raphides in the cells of Rhubarb, Onion, Hyacinth, &c., furnish most interesting subjects. They are crystals extracted from their roots; they are also found in the stems of the Echinocactus, &c. Algæ, both fresh water and marine, supply a great quantity of interesting subjects, and so do Fungi and Lichens. The thousands of Infusoria (Diatomaceæ and Desmidiaceæ) are of themselves a study for a lifetime, and nearly all are so small that they are undiscernible to the naked eye. They inhabit fresh and salt water, Mr. Pritchard tells us in his book of Infusoria that he had devoted most of his spare time to the study of them for over forty years, and most of them illustrated in his work are magnified three hundred diameters. They are very beautiful objects when highly magnified, and require the care of a specialist when setting up or mounting.

(To be continued.)

## Alocasia Sanderiana nobilis.

Beautiful foliage stove plants are not so frequently brought under notice, and the illustration of the handsome variety named above, which is portrayed on page 173, may bring an old friend to the minds of some, or be entirely new to younger readers. In any case, the plant is a very handsome one.

\* Paper read by Mr. J. Ollerhead at a meeting of the Wimbledon and District Gardeners' Mutual Improvement Society, February 17th, 1902, the subject being again brought forward on March 17th, after a discussion on Roses in pots.

## Roman Hyacinths.

It is a considerable time from now to December, but it is necessary to procure bulbs and pot them for a display of bloom in that month. All gardeners know the value of Roman Hyacinths, and how easily they may be had in bloom during the dark days. Though this is well known, the fact is often overlooked that it is necessary to pot the bulbs early so as to secure plenty of roots before top growth commences. In selecting, choose solid clean bulbs of medium size, as these give the best results. It is advisable to place the bulbs direct in the flowering pots, the best sizes being 5in to 7in pots. The smaller pots will hold four bulbs, the larger six or seven. Drain moderately.

The compost may be of a simple character. Old potting soil to which has been added some leaf soil, sand, and decomposed manure will answer well, or a mixture of fresh loam with the above materials may be preferable. See that it is fairly moist. Fill the pots about three parts full, gently shaking the material down, but not pressing it too firmly.

Arrange the bulbs closely together, and work in some soil between them and over so that the tips are just visible. Then give a watering and allow the surplus to drain away. When the surface is dry place the pots together on a base of ashes, and cover the pots with the same material moist, clean and moderately fine. A sheltered corner or a frame are suitable places. If leaf mould, not too much decomposed, is plentiful this forms an admirable plunging material and may be used. After plunging, the pots may remain undisturbed for at least six weeks. Then examine, and if growth has started from the tips to the extent of an inch, and at the same time the pots are full of roots, bring them out to the light, but do not expose fully for several days or until the blanched tips begin to assume a green hue.

Cool, airy treatment in a frame suits the bulbs. They will make steady and uninterrupted progress, and to have them in bloom in December will need little, if any, forcing. Successional batches to bloom later prove very serviceable, and help to prolong the display of this very useful Hyacinth.

To have bloom at any definite period it may be necessary to have recourse to a little forcing, but do it gradually, for a sudden increase of temperature might prove detrimental. There is little fear, however, with pots full of roots, as the bulbs are naturally ready to advance their flower spikes. Constantly moist condition of the roots and soil is imperative.—E.

## A Young Gardener's Trip to South Africa.

In the early morning of the fourth day after our ship, a Castle liner, had sailed from old England, we came into sight of Madeira, the fine climate of which is so much talked of. In appearance it seemed mountainous from the distance, much resembling the Scottish Highlands. As the steamer swiftly approached and rounded a point the town of Funchal appeared in view. Dotted on the hillside were whitewashed self-contained houses sparkling in the morning sun, and each having a good sized garden attached, and at the foot of the hill is the town itself, similar to a small English coast town. Naturally I was anxious to see if there was anything wonderful in our "line" to be seen on shore, so, with a few friends, we chartered a small boat and made for the pier. Here boys were selling baskets of flowers at 6d. and 1s. each, basket included. The flowers were composed of Callas, Cannas, Lilliums, Pelargoniums, Roses, &c., and Ferns, and would have cost at this time of the year, early June, at home from 5s. to 10s. compared with the small sum they asked.

On entering the Public Garden we were struck with the great amount of blossom therein, compared with the London parks a few days before, but neatness and cleanliness were conspicuous by their absence. The grass, notably, is of very coarse variety, and planted throughout it, at intervals, were specimen tree Begonias, 6ft to 9ft in height, and just a mass of bloom from top to bottom. In large separate beds were Liliun longiflorum, Callas, Cannas, Roses, double Petunias, and Geraniums, flowering more freely than anything I ever saw in our climate. Large plants of Streptosolen Jamesoni and Bougainvillea glabra were blooming profusely in the borders, the flowers being of a richer and darker shade than is usually seen at home; but to see the standard trained trees, over 20ft high, of Wistaria sinensis, with their rich blue tassels in galore, was, indeed, a wonderful sight. Huge plants of the Opuntia, or Prickly Pear, were common, and very curious it looked when we saw it growing as hedges round many of the private house gardens in which Bananas, Vines, Figs, and Sugar Cane

were mostly grown. As shade is a great requirement in this hot climate of Madeira, *Platanus orientalis* is the most commonly planted tree. I say *orientalis*, as the fruit heads on each stalk numbered from four to eight. A hurried visit to the market showed us vegetables of fine quality, and fruit of every description, selling at fairly reasonable rates for the early season. We had now to rejoin our ship, and shortly proceeded on our journey to the Cape.

#### Cape Town.

Thirteen days after we had sailed from the sunny shores of Madeira, Table Mountain was sighted early in the morning, with a good covering of snow for its tablecloth, a rather un-

Phoenix reclinata and Acacias. A fine tree of *Araucaria Bidwilli*, 30ft high, stood out prominently. Throughout the lawn there are beds of Pampas Grass, large specimens of *Agave americana variegata*, *Opuntias*, some 12ft high, and some fine plants of *Doryanthes Palmeri* were seen, and seem to stand the winter well. In different borders, fine plants of *Camellias*, *Datura suaveolens*, *Habrothamnus* and *Geraniums* were blooming freely, and some *Solanums* were quite red with berries; while enormous *Marguerites* were white with flowers. There is also a fine Rose garden, but it appeared that its occupants required to be kept under subjection as some of them were at least 6ft high. Still, some of the Teas were showing good bloom.

In one part of the garden a large triangular bed was being

*Alocasia Sanderiana nobilis.* (See page 172.)

usual occurrence for that part of the world, as we found out from some of the townspeople. I wish some of the snow had fallen when we were crossing the Equator, as the heat there was almost suffocating. Talk of Pine stoves! you should have a touch of the Equator heat in them and you could talk then. Unfortunately, it was cold and wet when we reached Cape Town, but after we had passed the ordeal of having our permits examined, we made tracks for the town. Before reaching the dock gates we had a full mile of mud, 4in deep to wade through. Unfortunately, too, it was winter, else we might have seen the renowned Government Avenue at its best. It is a fine broad walk, bounded on either side by sturdy Oaks. Close by, the Municipal Gardens are situated. Here we found plants which we would have been proud of at home, at 6ft or 8ft high, grown into trees 20ft to 30ft high; for instance, *Grevillea robusta*,

planted out with Scabious, and very singularly, the gardeners had started at the edges and planted towards the centre, where they seemed to be in a fix to make a decent finish. The glass houses, which were in first-class order, comprised a fernery, stove, and a mixed house of Palms, Tree Ferns, and Orchids, mostly *Cypripediums*, *Adiantums*, of good variety, and *Nephrolepis* were the most common; and in the stove, much the same class of stuff was grown as at home. A visit to Cape Town is hardly complete without a run out to Wynberg, the home of the Silver Tree, *Leucadendron argenteum*. To see the silvery leaves glistening in the sun is a beautiful sight indeed. In some shops in the town these leaves, after being partly handpainted and a suitable inscription printed thereon, they are then sold from 1s. to 2s. 6d. each, as mementoes of South Africa.—ALPHA.

(To be continued.)

## Some "Cottage" Tulips.

While the "English" Tulips will always command the admiration of the fancier, and will be cultivated by a select, if limited, coterie of connoisseurs, the less formal, and, it may be, less refined, flowers of the other sections will have a wider circle of admirers. This is not to be wondered at when we see these fine self-coloured or boldly marked flowers in the garden, or when cut and standing in bowls and vases about the house. Among these there are few so fine and so effective as the class known as the "Cottage" Tulips, flowers which have been mainly preserved through being grown in cottage and other old gardens at a time when the later Tulips of their kind had sunk into unmerited neglect. Now, however, they have again emerged from obscurity, and their number is being added to in various ways, so that there is choice enough and to spare of the most glowing or of the softest colours imaginable. As this is written I am looking into the garden upon some of these old flowers, and in an old lustreware jug and in other receptacles in the room are some of the choicest of these flowers, sent to me from the sunny Emerald Isle, which are finer than can be grown in the mixed border as permanent occupants, though it is possible to do them well even there, as I have proved for years.

While they are yet fresh and bright, let us take a look at these flowers. There is the shapely Bouton d'Or, of a bright golden yellow, and approaching more nearly the standard of the florist than the greater number of the class. Of a lighter shade, of greater size, and less formal in its outline, is the glorious fulgens lutea; while lighter yellow still is lutea pallida, though of like form and size. Still paler and more Primrose-like in its hue is the exquisite Leghorn Bonnet, and paler yet is the soft creamy vitellina, one of my favourites in the garden. Not quite so "black as Erebus," but of a chocolate black (to coin a term), is Nigrette, a large and handsome flower, reminding one of another called Eugène Delacroix, from another source.

With John Ruskin we are introduced to another lovely section, less effective in the distance, it may be, but of exquisite beauty. Beginning with orange yellow, shaded pink at the edge of the petals, it changes much as the flowers age, but with its combinations and changes is so difficult to do justice to that one had better say little more. Little less difficult is it to describe the charming Fairy Queen, which begins by being a kind of heliotrope and yellow, and dies off an exquisite fawn. This leads us to The Fawn, which is one of the prettiest of its class, with beautiful dove-like shades and tonings. Here, too, are the flaming flowers of Spathulata aurantiaca maculata, whose glowing orange-scarlet flowers are decorated with a deep black spot at the base of each petal. A pretty little flower, too, is Marjoleta, which is a pretty yellow, with a blotch of bright crimson at the edge of each petal. Then there is the beautiful canary-coloured ixioides, with its pretty flowers decorated with their black bases.

The forms of T. Billietiana are numerous, and all are beautiful, none being hardier or more acceptable than Golden Crown, which sometimes passes for the pure yellow Golden Eagle, and which has its pretty, pointed, yellow flowers at first narrowly edged with a scarlet line, which gradually spreads until the flowers are suffused with orange-scarlet. There is also a bunch of the pretty Goldflake, with orange-scarlet, gold-flaked flowers. A handsome flower, also, is Gala Beauty, or Columbus, with its vermilion and golden yellow blotched blooms; while for those who prefer such parti-coloured flowers, the white and cherry-crimson flaked La Panachée will prove welcome when May comes around once more. The plum-coloured Chameleon, blotched maroon, and shaded to light yellow, is handsome as well, while one might almost complete the gamut of floral colours by telling of the many more which, with white, scarlet, yellow, purple, and almost black, show us how glorious are these flowers of the early summer. Thus one might tell of the beautiful York and Lancaster, which you see one day white and pink, and a few days after has assumed tints one would consider incredible on the flower at first; or the beautiful Royal White, or the delicately-edged Picotee, or the chaste Didieri alba. All have charms, and none have ugliness. All help to give us delight, and all tend towards making the garden what a garden ought to be, a place giving cheering refreshment to the heart.—S. ARNOTT.

### Gathering Tomatoes.

"East Kent" says (page 164), "Gather the forwardest before they become fully ripe, and finish on a warm shelf." Excellent advice, if the reader wishes to sell them; but if he intends to eat them, let him leave them to thoroughly finish on the plant, and consume them the same day they are gathered. It is not unlikely that he will then say he did not know what the flavour of a Tomato was before.—W. R. RAILLEM.

### The Golden Poppy.

The writer of the interesting paper on "Cheddar Pinks" in last week's issue (page 144) asked about the Golden Poppy. It belongs to the Poppy tribe; but its name is Meconopsis cambrica (Welsh Poppy). It is a singularly pretty flower, and grows easily from seed. I have found it at the English Lakes, at Cheddar, and other places in Somerset. It is the only British species, and does well in gardens, sowing its seed around it.—J. L. WOODWARD.

### Rosa Wichuriana.

It was intensely interesting to follow the writer through "Roseland" (page 448) in his graphic glorification of this Rose and its progeny; but what about "that little green caterpillar" and the "slug shot," that "faithful friend and infallible remedy"? We have some bare, ugly banks crying out for beautification, and gladly seize on the good advice re Rosa Wichuriana, but if that "little green caterpillar" appears (and where won't he appear?) we don't want to be "humbugging around with other things;" hence, oh! writer in "Roseland," what is "slug shot"? Is it the name of some caterpillaricide, or is it the slug shot pure and simple? If the latter, how is it applied? Can one twang away with a catapult at the caterpillars, or just fill a gun and blaze away at 'em?—QUIZ.

The following we take from "The Florist's Exchange.—"There is a compound called 'slug shot' that is very extensively sold because of its cheapness. An analysis of this substance shows that it is composed almost exclusively of crude gypsum, with a small amount of arsenious acid and copper oxide added, probably in the form of Paris green. The amounts of these two substances in a sample recently examined were only 1.58 per cent. arsenious oxide and 0.58 per cent. copper oxide. It is needless to say that an article containing as little arsenious oxide and copper as the above will do little or no good as an insecticide. An analysis of another sample of this substance showed that very small amounts of sulphur, tobacco and carbolic acid were present, thus increasing the value of the preparation."—Ed.]

### Hedge Sparrow or House Sparrow?

In a recent issue appeared a paragraph relating to the depredations of the sparrows among the Corn crops; but the writer made a slip by confusing the hedge sparrow with the common sparrow. The hedge sparrow is one of our best friends, and is far too rare in the locality from which I write (Tewkesbury); but the common sparrow is an intolerable plague. He clears off our young Lettuces by the thousand in the spring, and if we do not protect them with wire guards he does the same with the Peas, even when they are 6in high. I found it quite impossible last spring to grow early Lettuces. It is true they were not much wanted, because the autumn-sown ones held out till very late in the season. But in some years, after a severe winter, or a hot dry spring, I have known Early Paris Market to be worth 1s. 6d. a dozen in about seven weeks after sowing, and in such a case the attentions of the sparrow would be far from welcome. I live on the outskirts of a town, and therefore am not able to judge, but I have an idea that many of our best friends of the feathered world are becoming scarcer. It would be interesting to know whether this is so in rural districts. What about the hedge sparrow above mentioned, with the tiny bill and the sweet song? the linnets, wrens, goldfinches, wag-tails, redstarts, and a host of others which I now seldom see? and I wonder how far the cheeky sparrow is responsible for ousting his more useful and more modest brethren. People with kindly hearts feed the birds and I do not complain of their doing so, but I am afraid where they feed one friend they feed

twenty fees. I am quite aware that the sparrows feed their young largely on insects but not exclusively, as some writers would have us believe, for I have seen them fed with Lettuces which I wanted for another purpose, and when the birds grow up they do not trouble much about insects till such time as they have a family to rear. Did they confine their attention to a limited number of plants which are large and crisp, I would not complain, but they prefer small plants just beginning to grow, and it takes a goodly number of these to satisfy the voracious creatures. Besides, if as I more than suspect, they are denuding the country of birds which are exclusively insect feeders, it is clear they do more harm than good, and that was the opinion of our dear old friend the late Miss Ormerod, who was no mean judge.—WM. TAYLOR.

### The Cheddar Pink and Other Plants.

Those who possess what is now termed a wall garden, are usually able to look upon the little Cheddar Pink as one of its prettiest adornments. Such will be more interested in it after reading Mr. H. R. Richards' description of the wild rocky home of *Dianthus cæsius*. A plant may be beautiful; it becomes doubly so when its surroundings are likewise. And although the flowers of the Cheddar Pink are frail when seen against the full, round garden Pink, the silvery, compact foliage would render it worthy of a place were it altogether blossomless. That place should be by preference, an old wall or rockery, for on flat borders the plant is inclined to rot off in wet winters. Those who regret to see the ever increasing list of extinct, or nearly extinct British plants, would only be glad if all the rarer native plants had such a strong fortification to retire upon as is the case with this Pink. Plants that inhabit the rocky cliffs and mountains of an island are well protected against extermination, while some that grace the grassy lowlands with quaint beauty, as in several of our Orchids, are too easily rooted out. In Edinburgh we have a rare native plant that is found in much the same positions as is the Cheddar Pink. This is the Viscid Catchfly (*Lychnis Viscaria*) whose improved double forms are among the best bright flowers of summertime. Even in its wild condition it is a pretty plant, although often starved and stunted in hot, dry seasons. In the good soil of a garden, its flowers increase in size and its appearance improves. This pink Catchfly grows plentifully enough at Blackford Hill, near Edinburgh, but nearer the city, on Samson's Ribs, a precipitous cliff of Arthur's Seat, it is not so easily gathered. In some years one may find it low enough down, while in others a climb up the crumbling basaltic pillars is needful to procure the plant. This is dangerous to ribs other than "Samson's!" Another plant mentioned by Mr. Richards in addition to the *Dianthus*, is the elegant yellow Welsh Poppy (*Meeonopsis cambrica*). It is a perennial that likes to be squeezed by the roots, so that a wall or cliff affords it a happy home. In Edinburgh (it is not wild here) the Welsh Poppy flowers earlier than the native kinds. Its season in the rock garden is over now, and seeds are ripe. The double flowered form, a plant decidedly worth possessing, has flowered throughout the summer, and it has yet a blossom or two, compact and longer lasting than the ordinary one.—D. S. FISH.

### "Out of a Place."

DEAR "OLD BOY,"

I am one of a number who think they have a distinct grievance, and, that, too, against none other than your own respected self. I can imagine that many of your admirers will at once be in readiness to take up their cudgels on your behalf; but if I say we complain more in love than anger, I hope they will not be quite relentless with me for being spokesman. Our grievance is this: You have at various times addressed articles of encouragement and advice to the budding gardener, the enthusiastic journeyman, the aspiring foreman, and the young head gardener, all of which we know have been appreciated, taken to heart by many; but never a word have you written to the fellow who is "out," and whose luck is, or seems to be, "dead out" as well, and there are many of us in that predicament just now.

We feel, too, as if we had been unintentionally misled by your kind and well-meant advice, and, through it, have been following a wrong course, which has to an appreciable degree brought about our present misfortune. The latter we attribute as well to every cause imaginable, excepting, of course, ourselves, and what Englishman would do that?

Some of us trace our bad luck from the advent of the new century, but as we have a long way to go to the next, we cannot reasonably hope that when it comes, should it bring a better vein of fortune, it would very materially affect us. Some—disloyal members of an honourable profession—say the Coronation Year has brought bad luck to everybody, His Majesty himself not excepted, and that the "screw" is being applied in every direction, but in no place more so than in the garden, and to that reason their presence among the unfortunates is attributed. Others—these a very large number—ungallantly

avow that the fact of their being out is directly due—I use their own phrasing—"to the unreasonableness, general cussedness, and petty tyrannies of swivel-minded lady employers." As if any lady could be awkward, or unreasonable, or would be if she could! They say, too, that it is perfectly useless to attempt to reason with, or expect justice from, a prejudiced woman. On the latter I am not prepared to express an opinion, but I can see wisdom in not pursuing the former course of action. Some of these degenerates even affirm their intention of having nothing to do with a "shop" where the "missus" is "boss," but I pointed out that the comparative rarity of bachelor-governed gardening establishments would render them liable to be out a very long time.

Another division (those I am in direct sympathy with) say, that on making application for any vacant post, they at once meet with the rebuff, that no foreman will be treated with, although the candidates may have spent fifteen or twenty years in first-class gardens. One employer even went so far as to say that he wanted a man with at least ten years' experience as head, but when an applicant turned up with the necessary experience, he was immediately told that he was too old!

The chief reason, however, for the iron having entered so deeply into our soul, is the fact that our one-time bothy comrade is now head gardener to Lord —, at a salary of £120 a year, with the usual perquisites, scorning the advice you gave us in those articles we read with so much pleasure a few years ago, spent his evenings on the cricket ground, and acquired the secret of "off" and "leg-breaks," "leg theory," &c., and is now captain of the club which his lordship so munificently maintains, and presides at the luncheons so generously provided for the home fixtures; while we, who in the solitude of the bothy struggled with the mysteries of right angles, equilateral, isosceles triangles, in circumstances very much "off," are perilously near being "stumped," with scarcely a leg to stand on, are confronted by an "asses' bridge," which no study of the elements of geometry will help us to negotiate; and as the weeks roll on into months, months into years, our depleted exchequer becomes less able to bear the strain imposed on it, we seem likely, eventually, to be included in a very large "natural order," which was not within the range of our studies for that precious South Kensington certificate, the common or garden name of which is, I believe, Ne'er do wells.

This condition of things is to us, to say the least, extremely disappointing, although Lord So-and-So's gardener says he has but little fault to find with it, and that if either of us had been in his place, well—he would not have been there, which seems logical. He added, too, that he could not see that it was bad luck which put him in his present position instead of me, with which view I could not agree; and then we dropped into an unprofitable discussion as to what constituted good or bad luck, but could agree on no point except that it was bad luck there were not good situations for us all. He told us that it was his fine batting while living at N—, as foreman, which brought him into notice, and which enabled him to obtain the influence necessary to secure such a good post as that of head gardener to Lord —, when it suddenly dawned on us what idiots we were in thinking that it was ability, application, and experience that were the chief factors necessary towards obtaining an appointment. Influence we had never reckoned with at all. "H." informed us as well that even the parson at N— very kindly interested himself in the matter, and wrote Lord —, saying what a capital fellow he ("H.") was, and how useful he had found him at the village bun struggles, and such-like institutions, and how delighted he should be to hear that Lord — had appointed him to the vacancy.

We heard the other day that "H." had written down to C— and Co. for a man to come up and pot his Orchids, as he had not a man capable of doing it, which seemed to us admission that he could not do it himself. An old companion, now in adversity, whom we will name "Jack," whose Cattleyas at the Temple, and Grapes at the Palace, when he was foreman at G— Hill, you will remember, and who has been walking the streets of late, was sent down to do the potting. "H." actually admitted to "Jack" his total ignorance of Orchids and their requirements, and "Jack," in that suave manner of his, said the admission was perfectly unnecessary. He always had a nice way of saying unpleasant things. I expect "Jack" will go on with his street walking when he has finished, unless he should be so fortunate as to be able to secure a berth, but, as he says, "How the plie'man (he didn't say "plie'man") he is to get a second head place without having a first, he cannot very well see," and under present conditions the latter is an impossibility; but, like the philosopher that he is, concludes that he ought to be big enough (he is not exactly an infant) to squeeze in somewhere. It seems to us we have made a mistake in not following up the cricket and the bun struggles, but we are not quite sure on the point. Any advice and a little encouragement will, I know, be appreciated by those who NEVER DESPAIR.

P.S.—We get down to Kew whenever we can, and as soon as the evening classes commence shall probably have another turn at those triangles.

## Shrewsbury Floral Fête.

August 20th and 21st.

The show yard again! The show yard? Ah, well, no, that smacks too much of the agriculturist's competitions, where well-groomed shorthorns, pedigreed stallions, and fat swine are the objects of all the stir. Horticultural exhibition grounds are equally as bustling as agricultural show yards, and the subjects of competition incite quite as much of interest and admiration.

Such a show as that held this week at Shrewsbury is of great educational value to those many gardeners whose outings are all too rare, and who have few chances of seeing the products of other gardens outside their own county. Such practitioners are doubtless apt to fix a wrong standard of excellence in their minds which a visit to such a show as we now report, if only made once in a while, is pretty sure to correct.

The exhibition this year maintains the record of success, and so many as 200 more entries than last year were received on this occasion. The general impression gained in a cursory look round before judging commenced was that lack of sunshine and long-continued cold weather over these islands seems to count for little against the strength of purpose and ability of the British gardener. Muscat Grapes were many times staged rather green, and there may have been less profusion of blossom on some of the specimen flowering plants, Dahlias and early Chrysanthemums, too, being backward, and Roses few; but on the whole the show was admirable, and highly creditable in all departments.

New features cannot very well be expected, but some of the trade firms display a commendable spirit in their efforts at novelty, and in introducing "something new." The executive of the Shropshire Horticultural Society, too, are certainly not apathetic. This year they have lighted the largest marquee with electric lamps, so that the workers could continue with the best possible convenience all the night long, if they had a mind to. Another point worthy of notice, though not novel here, is the facility for competitors to find the exact spot whereon to stage their various entries. At the edges of the tables in all the tents are printed cards bearing the numbers and description of the class, these cards being neatly tacked down, and one is provided for every entry that has been booked. Could anything better be devised? There is absolutely no chance for confusion or mistakes.

The eve of the show was calm and pleasant, with full moonshine, and the Wednesday morning opened in bright sunshine, and with a brisk breeze. Prognostications for rain were made by some, but for the sake of those who so much deserve success it was hoped the weather would hold fine.

The London complement of competitors, visitors, judges, and journalists must have felt satisfaction in noting the freshness of the country throughout the route. Corn crops are heavy, and harvest in all the counties southward is general. Potatoes are being lifted, and even some of the cornfields are again being ploughed.

### Plants and Groups.

This section was, as usual, represented in great force, nearly all the champion plant growers taking a part. The huge specimen plants and groups filled two enormous marquees. The colouring of the Crotons was truly remarkable after such a dull season, and the majority of the flowering plants were in the pink of condition. They were, without doubt, a triumph to the gardener's art.

The class for twenty stove and greenhouse plants is always a strong one here, but on this occasion there were no less than four entries, a gigantic show in one class, the prizes, £25, £20, and £15, being enough to attract exhibitors from all parts. Mr. B. Cromwell, gardener, to T. Sutton Timmis, Esq., Allerton, Liverpool, secured the blue ribbon, with three gigantic Kentias, Crotons Queen Victoria, Aurea, and Marantas, Countess Montefontaineensis, and Williamsoni. These were quite remarkable for their huge size and perfect colouring. The flowering section was well represented by Ixoras Williamsi (two plants), Coccinea superba (two plants), Duffi, and Pilgrimi, Rhododendron Taylori, superb plants of Lapagerias alba and rosea, Allamanda Hendersoni, Statice profusa, and Stephanotis floribunda, in good condition.

Messrs. J. Cypher and Son, Cheltenham, were a capital second, the best plants being Statice intermedia, a grand plant. Bougainvilleas Cypheri and Sanderiana were in excellent condition. Crotons Queen Victoria and Sunset made a splendid display. The Allamandas were also good. There could not have been very much between these exhibitors, while Mr. W. Vause, Leamington, was third, with large plants, which, however, were considerably behind the others in development and finish.

For a group of miscellaneous plants, foliage and flowering, arranged for effect, in a space of three hundred square feet, with prizes equal to those in the first class, four competitors faced the judges, all of them making a fine display. Messrs. J. Cypher and Son were placed first, the arrangement being artistic, and the

material employed of the best. The chief foliage plants were Cocos Weddelliana, Bamboos, Aralias, Crotons, Asparagus, Dracenas, and Ferns. The "dot" plants were very striking. The flowering plants were chiefly Orchids, Begonias, Ixoras, and Lantanas. The whole groups were quite fairylike, and quite up to the Shrewsbury standard.

The second position was taken by Mr. J. V. McDonald, gardener to G. H. Kenrick, Esq., Edgbaston, and it was in every way worthy to do so. The plan followed was well carried out, the whole of the ground being covered without undue crowding. The Orchids, Crotons, Lilioms, Humeas, and Palms were the chief features. Mr. W. Finch, Coventry, was third, with a different design, made of arches and mounds. The white Lilioms, with a quantity of silvery foliage, were most conspicuous, and gave quite a separate character to the group.

Class 3 was for a group of plants, foliage only, of the same size, and the same prize money as in the previous class. This attracted three competitors. Messrs. J. Cypher and Son were, however, easy winners, the Palms and Crotons being remarkably well coloured, while the arrangement left little to be desired, the groundwork being especially good. Mr. J. Thompson, gardener to G. H. Turner, Esq., Derby, was second, with a distinct arrangement of choice stove plants, the Crotons and Alocasias being noteworthy; while third honours went to Mr. J. V. McDonald for a pretty arrangement of plants, the copper shading being quite a feature throughout the group.

Class 4 was for thirty stove or greenhouse plants, not to exceed ten inches. Orchids excluded. These made a brave show, Mr. T. Lambert leading well with some remarkably fine plants for the pots. The most noteworthy were Clerodendron fallax, Ixora Pilgrimi, Bougainvillea glabra, Dipladenia amabilis, Allamanda Hendersoni, and a few Crotons, beautifully coloured. Mr. B. Cromwell was second, with good specimens of Crassula coccinea, Ixora Duffi, Alocasia Sanderiana, and Lapageria rosea superba; while Messrs. J. Cypher and Sons occupied third place.

The single specimen flowering plant only brought out three plants, Mr. W. Vause being placed first with a good plant of Erica æmula, which lacked freshness. Messrs. J. Cypher and Son followed with a well flowered plant of Statice intermedia; while Mr. W. Finch brought up the rear with the same variety. This was a weaker class than one would expect here.

In the class for four Ferns there were five competitors. Here Mr. B. Cromwell won first place easily with good specimens of Microlepia hirta cristata, Nephrolepis rufescens, a grand plant, Nephrolepis davallioides furcans, and Adiantum euneatum. Mr. J. Stevenson, gardener to Mrs. J. H. Slaney, Wellington, was second, and Mr. J. Carter third.

For six Dracenas there were only two competitors, the first prize going to Mr. T. Lambert for large well-coloured plants. Mr. R. Lawley was second with good coloured plants but smaller.

Coleuses were rather sparsely represented, only two exhibits being staged, the first prize going to Mr. H. Worrell for four moderate specimens; Mr. T. Stevenson being second with smaller plants.

The beauty of the Caladiums was destroyed by being staged on a table without covering. Mr. B. Cromwell led off with six well coloured and developed plants. Mr. S. Bremmell followed with rather soft plants, and Mr. W. Ashwood, gardener to R. A. Newill, Esq., Admaston, was third.

Class 10 represented four Fuchsias, for which there were three entries, Mr. J. Jenks, Castle Fields, being first with six moderate plants. Mr. A. Bateman was second with a good fresh exhibit, but rather smaller; while Mr. J. Farrant made a good third.

Mr. H. Clift, gardener to R. Taylor, Esq., was the only exhibitor of six single Zonals, and was awarded second prize; rather hard luck. For six double Zonal Pelargoniums there were three entries, and Mr. H. Clift was placed first with nice fresh plants. Mr. W. Payne, gardener to E. S. Godsell, Esq., Stroud, followed, and Mr. Jas. Farrant, brought up the rear.

Class 14 was for six Begonias, and there were three entries, but Messrs. B. R. Davis and Sons, Yeovil, were handsomely first with six splendid plants, the scarlet W. Sparshot being excellent. Mr. H. Clift followed with larger plants, and Mr. J. Farrant came third.

Gloxinias were represented by five entries, the first prize going to Mr. J. Carter, gardener to W. J. Scott, Esq., Berford House, for a splendid exhibit; Mr. Chas. Yeoman, gardener to A. Darby, Esq., Baschurch, made a good second; and Mr. Jas. Farrant third.

Table plants were good throughout, Mr. B. Cromwell winning with capital Crotons and Palms. Mr. A. H. Hall, gardener to J. C. Waterhouse, Esq., Prestbury, Macclesfield, followed, and Mr. F. Jordan, gardener to T. Corbett, Esq., Impney Hall, Droitwich, was third.

Class 17, for a collection of thirty plants in 5in pots, not less than twenty in bloom, made a good show. The first prize was awarded Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, for a good collection; the best were Ixora Prince of Orange, Begonia Gloire de Lorraine, Acalypha Sanderiana, Alocasias,

and Clerodendrons. Mr. B. Cromwell was a somewhat weaker second, while Mr. J. Carter made a neat exhibit for third place.

#### THE FOLLOWING CLASSES ARE CONFINED TO THE COUNTY OF SALOP.

The group of plants arranged for effect to occupy 150ft. Orchids excluded, confined to the county of Salop. Here there were three entries; Mr. C. Roberts, gardener to Mrs. Swann, Halston Hall, Oswestry, proved the victor, for a well-arranged group, the mounds being well covered with choice plants, while the dot plants were well selected and most effective. Mr. S. Bremmell, gardener to H. N. Hayhurst, Esq., Wellington, came second with a pretty group, but rather lacking in finish; and Mr. W. Phillips, gardener to T. F. Kynnersley, Esq., Leighton Hall, was third with a rather heavier arrangement. The winner in this class secured a Coronation Cup value five guineas, presented by the President.

Class 19 was for six stove and greenhouse plants. Here the entries numbered two, Mr. T. Lambert winning first prize with good plants of *Areca Vershaeffelti*, *Croton Warreni*, *Allamanda Williamsi*, a fine plant of *Eucharis amazonica*, *Vinca rosea*, and *Ixora javanica floribunda*. Mr. W. Phillips followed, having a good specimen *Hydrangea*.

The following class for a similar number of plants, not less than three in flower, exhibitors in the previous class barred. Here Mr. J. Carter was deservedly awarded the first prize with good plants of *Stephanotis* and *Bougainvillea*. Mr. Jas. Farrant was second, and Mr. A. Jones third.

Class 21 was for three *Fuchsias*, and four competitors staged, Mr. H. Worrall being placed first, Mr. A. Bateman following with fresh small plants, and Mr. J. Jenks third.

*Begonias*, four plants, found three exhibitors, Mr. J. Carter being awarded first prize for good plants, which were fresh and bright. Mr. N. Clift was second, and Mr. J. Farrant third.

For three double *Geraniums* there were just three competitors, and Mr. J. Carter proved the victor with three well-flowered plants, followed by Mr. J. Jenks, while Mr. H. Worrall was third.

There were a similar number of contestants for three single flowering plants. Mr. J. Carter repeated his success, and carried off leading honours, followed by Messrs. J. Jenks and H. Worrall in the order named.

#### Cut Flowers.

The tents devoted to the cut flowers and floral arrangements were filled to overflowing, and were quite up to the usual standard seen here. It was difficult to report them satisfactorily owing to the dense pack of visitors, who evinced great interest in these classes.

The class for a display of floral arrangements in a space of 12ft by 5ft was rendered additionally attractive by a silver cup presented by the Shropshire Society in London, and a fine display was made in the class. Messrs. Jones and Sons, Shrewsbury, proved the winners with a grand floral display, consisting of harps, baskets, bouquets, and a large variety of other designs. Mention should be made of an erect cross of crimson *Asters*, with a few *Liliums*. The firm are to be congratulated on their success.

For a bridal and ball bouquet there was a keen competition. Mr. W. Hayward, Kingston-on-Thames, was placed first for a pair of beautiful bouquets, composed chiefly of Orchids; Messrs. Jones and Sons were second with a similar pair, and Mr. J. Derbyshire third. In the class for similar work with Orchids excluded there were three entries, Mr. W. Treseder, Cardiff, being a good first. Messrs. Jones and Sons were second, and the third prize was withheld.

The Cactus Dahlia does not appear to be popular for bouquet work, for there was only one entry for a bouquet of Cactus Dahlias. This came from Mr. W. Treseder, and was deservedly awarded the first prize. The *Roses*, however, did not do much better, for there were only two, Mr. W. Treseder again leading with a pretty arrangement, and Mr. J. Derbyshire was second.

Messrs. Jones and Sons were first for a featherweight bouquet, which was composed chiefly of Orchids, followed by Mr. J. Derbyshire with a weaker arrangement.

The competition for a floral basket was keenly contested, Messrs. Jones and Sons being first with a delightful basket, followed by Mr. W. Treseder and Miss K. Coster in the order named.

Class 32 was for a stand of cut flowers, and there were five entries, Messrs. Jones and Sons leading with a pretty arrangement of scarlet *Carnations*. Miss K. Coster followed with pink *Williams* and Co. were second, and Mrs. Jones, Bicton, third.

The class for a bamboo flower stand of Cactus Dahlias brought out a good entry. Mr. W. Treseder was, however, a good first with an arrangement of mixed colours. Messrs. Keynes, Williams and Co. were second, and Mrs. Jones, Bicton, third.

Messrs. Jones and Sons were the only exhibitors of button-holes and sprays, and were awarded first prize, which they richly deserved.

The class for a collection of hardy perennials arranged in

a space of 15ft by 5ft, with prizes of £10 for first and the others in proportion, made a really fine display. Messrs. Harkness and Son, Leeming Barr, were placed first with a grand collection well arranged. Messrs. I. Hense and Son, Westbury-on-Trym, were second with a pretty display, and Messrs. G. Gibson and Co., Bedale, third. It was quite impossible to get near this class to report the different subjects employed.

In Class 37, for a collection of hardy perennials (*Roses* excluded), arranged in a space 15ft by 5ft, and all distinct, Messrs. Harkness, of Bedale, beat House and Son, of Bristol, and third Messrs. Gibson and Co. Though very fine, still, where £10 is offered for first prize, the exhibits ought certainly to be richer, larger, and more choice and handsome. The Shrewsbury groups do not equal those shown as a rule at the Edinburgh Show in September.

*Dahlias* were scarcely advanced enough to appear with any effect, yet the groups of Cactus varieties in a space 10ft by 5ft, were interesting thus early in the season. In class 38, space as here stated, Messrs. Keynes, Williams and Co., Salisbury, were placed foremost; Jones and Sons, Shrewsbury, second; and third, Messrs. Rowe and Son, of Worcester. For a general collection of all sorts of Dahlias, the awards were given in the following order: 1, Mr. Treseder, of Cardiff; 2, Keynes, Williams, and Co., and 3, Jones and Sons. *Carnations* were splendidly shown, but we unfortunately overlooked the names of the prizewinners.

In Class 41, for two dozen bunches of hardy flowers, the leading prize was accorded to Miss Humberton, Newton Hall, Chester, beating Isaac House and Son, and Gibson and Co., of Bedale, who followed so. Competition was keen here, and also in the next class for one dozen bunches of the same where nurserymen were excluded. Miss Humberton again led, and in second place came the Bishop of Shrewsbury; third, Mr. F. Briskell, of Nuneaton.

For thirty-six *Gladioli*, in Class 43, Messrs. Harkness had the premier award easily.

Here we should like to enter a protest against the unnecessary pasting of the prize-slips over the class numbers on the entry cards, making it still more difficult for Press men to fulfil their duties and report correctly.

*Roses* were but a small contribution, the prizes for twenty-four blooms going respectively to Messrs. Harkness, D. and W. Croll, and the King's Acre Nurseries, Limited. The classes were poor.

In Class 50, for twenty-four blooms of Show and Fancy Dahlias the renowned M. Campbell, from High Blantyre, N.B., took premier honours, but Mr. S. Mortimer's second prize lot were exceedingly close in points, to say the least. Mr. Treseder, from Cardiff, was third. For twelve of the same, trade excluded, the awards went to: 1, Mr. S. Cooper, of Chippenham; and 2, Mr. T. Jones, Ruabon. For twenty-four Cactus Dahlias, not more than two of a sort, Mr. Mortimer won nicely with beautiful blooms, containing the following list:—Mrs. E. Mawley, new seedling Brightness, Vesta, Mrs. Winstanley, Mrs. Carter Page, Viscountess Sherbrook, new seedling Mabel, Uncle Tom, Gabriel, Lyric, Mrs. A. F. Perkins, Monarch, Mayor Tuppenny, Jealousy, Mrs. J. J. Crowe, Sport, Starfish, and Mrs. Mortimer. Messrs. Vernon and Barnard, of Nantwich, came second. For a like amount where the trade was excluded, Mr. E. King King, of Leominster, led, and also for six vases of Cactus sorts, three of each.

Attractive prizes for Sweet Peas, in Class 65 (twelve distinct kinds arranged in vases), brought out a considerable number of good collections. Mr. R. Bolton, of Carnforth, was first, and Messrs. House and Son second.

#### Fruit.

This section draws perhaps greater notice than any other at Shrewsbury, and when the handsome money prizes for collections of fruits and for Grapes are considered, knowing also that the champions from far and near annually bring the products of their skill, it is not to be wondered at that the fruit leads even against plants and flowers.

There were five decorated dessert tables this year for the prizes of £15, £12, £8, and £5, respectively. Judging, as is well known, is done by points, and the highest number on this occasion was gained by that hero of many competitions, Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, whose collection included Muscat Hamburgh, and Muscat of Alexandria Grapes, the former well coloured, the latter only moderately; Pears Triomphe de Vienne were perfect; Transparent Gage, Elruge Nectarines, Royal George Peaches, Ribston Pippin Apples, Royal Favourite (green flesh), and Taunton Hero Melons, with a handsome dish of Figs, completed the display. The varieties on the off-side of the table we were unable to see, the wire netting having been run round after judging was finished. The points awarded were as follows, and we give the possible numbers in brackets first. Thus for Apples (7), 6; Figs (7), 6; Grapes, two, black (10), 7; (10), 9; Grapes, two, white; 7 in both cases out of 10; Melons, two (8), 7; and again 6. Peaches, twice 6 out of 8; Pears, two, 6½ and 6 out of two sevens; Plums (6), 5½; and for beauty of flower and foliage 7 out

(Continued on page 180.)

## Bucklebury Place, Woolhampton.

The day on which I visited the Berkshire residence of Arthur W. Sutton, Esq., proved to be one of the warmest and most congenial in that long series of dripping days with piercing winds that formed the spring and early summer of the current year. The "Place" itself lies high and dry on the foreslopes of Bucklebury Common, eyeing in wide perspective the whole southern flange of rural Berkshire, and unsurpassed in the magnificence of its own surroundings. The month was May, and by the wayside one plucked the crimson leaves and rose-pink flowers of Herb Robert, and nowhere does the greater Starwort—the *Stellaria Holostea*—luxuriate more vigorously

Bucklebury Place, Woolhampton, Berks.

than on the banks and by the hedgerows of this Woolhampton district.

Bucklebury Place lies westward from Reading, at a distance of some fourteen miles. Since it was purchased by the present owner the gardens have been entirely designed and made, and even the picturesque residence in Swiss style of architecture, and half-timbered construction, has been completed during his tenure. It commands an unrivalled view of the surrounding hills and dales, while sun and wind can never miss it. The illustration presents a glance of the house from the north side on which is the main entrance door and carriage way. The lawns are diversified by groups of shrubs, among which the handsome *Rhododendrons* are deserved when still a long way off. The brilliance of the *Rhododendrons* in the higher plane was equalled by the charming beds and borders of *Wallflowers* below them, and of which there were a full selection of the Reading firm's varieties.

None of these excel the colour effect of *Cloth of Gold*, which glows like sun-smitten brass, and few deeper *Wallflowers* than *Purple Queen* are seen anywhere about. *Eastern Queen*, of a pale apricot shade, was used in lines pleasingly with the two above, and in massed beds was the *Blood Red* variety—a splendid spring flower. Sutton's Giant strain is notable for large flower spikes, in colours orange, yellow, and crimson. *Faerie Queen*, with pale lemon flowers, is distinctly pleasing; while the *Dwarf Yellow Bedder* and *Brown Bedder* sufficiently indicate their characters, and each of these *Wallflowers* were seen at their best at Bucklebury.

At the south-eastern corner of the house a formal garden is gaily furnished with simple spring flowering plants. Named *Forget-me-nots* provide contrasting colours, as *Myosotis Perfection*, a bright blue, with *Narcissus Barri* conspicuous *M. Royal Blue* (the brightest and best of blues) below other yellow *Daffodils*, and *M. Perfection White*, as a carpet below *N. princeps*. These named *Forget-me-nots* were all from seeds, and it was interesting to note how true to colour each had come. These notes on varieties may be of service to those who desire diversity in a simple way, among early flowering hardy plants.

But undoubtedly the new Dell garden on the south front is the choicest feature of the ornamental grounds. A few years ago this was part of the wild woods, and he was an explorer who ventured there. Now there are sloping lawns, smooth-shaven and dotted with beds of *Japanese Maples*, *Genistas*, *Double Gorse*, *Berberis stenophylla*, *Rhododendrons*,

and many other shrubs. On page 183 there appears a bird's-eye view of the Dell garden, but the photograph gives the impression of a flat stretch of ground, whereas the slope is very considerable and terminates in the water-fall and pool of which a forward view is given on page 179.

A winding path encircles the inner margin of this large section of the grounds, passing from the rockery steps (seen in the foreground on page 183) downward, first to the right, then in a noble sweep to the left, clear by the neat little lake containing carp and other fishes. It was a stroke of boldness and a successful effort of judgment to introduce the rustic summer-house with its heather-thatched roof and accompanying characteristic bridge, into the direct view as seen from the rockery steps. Mr. Alexander Wright, as gardener in charge, has here a valuable testimonial to his skill as a designer, and he is a most successful cultivator both in and out of doors. Our photographs are also from his camera.

The rockery pockets and the artificially made bed and supports of the waterfall, are composed of a stone-like concrete. Since the planting was completed, the numerous shrubs have now developed, and the whole scene presents a view suggesting a long-established garden, with its features well taken care of. The *Japanese Maples* already mentioned have shown no signs of deterioration, indeed they are perfectly at home. *Azalea mollis*, in variety, have also grown well. Hardy *Water Lilies* find a place in the pools, and *Caltha palustris* is highly effective by the water's edge. Thousands of *Daffodils* stud the grassy slopes among the surrounding trees and bushes in the spring-time, and later come the *Foxgloves*, *Verbascums*, *Epilobiums*, and numerous beautiful and choice hardy Ferns as additional subjects of interest. *Nepeta Glechoma variegata*, the white leaved *Ground Ivy*, flourishes out of doors on the shaded banks, and might be oftener used with the same success, for it is quite hardy. It may become uninteresting to the reader if description descends too much to detail, so that the names of dwarf alpine *Phloxes* which thrive so splendidly here, and of the fine collection of *Geums* and other hardy flowers need not be enumerated, but at Bucklebury the aim is to have only those flowers that are worthy of the labour they receive.

The kitchen and fruit garden is in good keeping, and would require to be, in order to meet the demands made upon its resources. *Chrysanthemums* are liberally represented and gave promise to become sturdy plants. Melons were especially fine, and fruits of 3lb weight were borne on each of the plants, five fruits to each. Three or four varieties are relied on, these being *Best of All*, Sutton's *Scarlet*, *Ne Plus Ultra*, and *Ring-leader*. Of *Cucumbers*, the favourites are *Every Day* and *Satisfaction*. Grapes were all creditable. *Gloxinias* among plants were magnificent: I had seen what were considered the best of London trade displays, and the collection at Bucklebury was no way inferior, but rather the superior. *Caladiums*, *Crotons*, stove plants generally, including winter flowering *Begonias*, *Caledonia* and *Turnford Hall* included, each were nicely represented. Splendid *Fuchsias* are grown as pyramids to a height of 7ft, and are placed by the margin of the lake in the Dell Garden during summer. Orchids, and especially *Cypripediums*, are grown largely and well, hybridising having been practised among some of the better known species and named progeny are now included in this collection. Altogether, the garden and grounds here are highly interesting and instructive. Amid his breezy surroundings, the owner must indeed find rest from the pressure and burden of business; he also stimulates a love for cricket and football among the men and youths of the neighbourhood by providing a large playing field and suitable equipment. Nor are the quieter recreations omitted. An ample building has been at the disposal of the community for some years, within which lectures on technical subjects are periodically arranged, and one of the most useful series carried to a successful conclusion was instruction in the "First Aid to the Injured," for which certificates were awarded after examination. Billiards, ping-pong, draughts, chess, and other games demanding skill, are here to be enjoyed.

The district eastward to Aldermaston over the great Common of 6,000 acres, and beyond, is typical of the finest English rural landscape. Magnificent grass rides and roads seam the surface of the Whin covered Common, and here and there one finds a brackish pool, starred over with the beautiful aquatic *Ranunculus*; Heather and Sloes and many wild flowers cover the knolls, while at the verges are *Fir* and *Oak* woods. Through a great *Oak* avenue, with ancient and symmetrical trees, by Hazel woods and Willow holt, meadows with their kine, and here and there a village or hamlet, the tour is made, and on the

way the fortunate may obtain permission to view the Kimberhead Springs, or bubbling pools of water that flow beneath the hills of chalk from higher up, to issue here at Kimberhead, and these most beautiful springs, with unceasing turbulation emerge from their bed of silver sand 40ft beneath the placid surface of the crystal waters. Green they seem, and green, lurid green they are, from their depth alone. The whole inner body of these huge natural cisterns are diversified by aquatic vegetation, green, black, and brown, while lying motionless as in death, one espies the wavy outlines of massive trout. The Beech trees overhead, and Willows by the brink, allow the straggling sunbeams entrance, and whose shafts of golden light pierce downward and illuminate the deepest recesses of this indescribably beautiful scene. Jules Verne in his Nautilus ne'er viewed a subterranean creation more wonderful or more enchanting.—J. H. D.

## Figs Under Glass.

### House for Earliest Supplies.

This may contain trees in pots or planted out. The first is much better for securing very early Figs, as the trees are under control, and selection can be made of the most promising for yielding a first crop, which is much the most valuable, dishes of ripe Figs in April being prized, as fresh fruit is not then plentiful, and there is always a charm in variety at dessert. The house should be light, airy, and well heated. A low three-quarter span-roof house, facing the south, is best, with a pit for holding fermenting material, such as Beech, Spanish Chestnut, or Oak leaves, which gives a moist genial heat and moisture over a considerable period, greatly reducing the necessity for fire heat, and more suitable for the Fig trees. Those intended for early forcing in pots may be placed outdoors when the wood is ripe, but they must not be so treated if there is any doubt about this, keeping them under glass, with a free circulation of air. These are matters on which the cultivator will need to exercise his judgment. In either case encourage surface roots by dressings of manure, rough loam, and a sprinkling of superphosphate. See that those placed outdoors do not root from the base of the pot. Cut off all roots that have passed into the plunging material,

top-dress, after which give a good watering, and they will need no more water than suffices to keep the foliage in health.

In the case of the earliest forced planted-out trees, these will now be ripening their wood, and watering may be discontinued, air being given very liberally. If, however, the second crop is not yet ripened, moderate moisture in the soil will be necessary, with a free circulation of warm air to secure quality in the fruit. When the fruit is off, take prompt measures to destroy insects, red spider and scale being the most assiduous, and are annihilated by dressing with petroleum emulsion, applied, after due dilution, with a brush, so as to dislodge the scale.

### Fig Trees Unsatisfactory.

Planted-out trees not infrequently grow rampantly, and, consequently, produce their crops of fruit. In that case lifting and root-pruning should be resorted to, and the roots confined to a narrow border, 3ft to 4ft in width, or not more than one-third the breadth of trellis the trees are to occupy. A trench taken out at this distance from the stem down to the drainage after the fruit is gathered will check the tendency to a late growth, assist in the ripening of the wood, more particularly if the growths are thinly disposed, and the points of the shoots, instead of being closely tied in, are allowed to grow up to the glass. If the drainage be defective, it will be necessary to lift the trees in the autumn as soon as the leaves commence falling, and replant in fresh compost. Place in 12in of drainage, rough at the bottom, and fine at the top, that at the bottom being the size of half-bricks, and in degrees smaller upwards; have the material about the size of road metal at the top, placing on this a 3in thickness of old mortar rubbish, freed of old laths and other pieces of wood, smashed, and sifted with a half-inch sieve, using that remaining in the sieve, the finer particles being suitable for mixing with the compost to the extent of one-sixth. Turfy loam, inclined to be strong rather than light, forms a suitable rooting medium, provided it contains a fair amount of gritty matter, preferably calcareous gravel, or have added to it a sixth part of old mortar rubbish. Where obtainable, a bushel of wood ashes may be mixed with each cartload of loam and a peck of crushed half-inch bones. Other enriching materials may be added and mixed with the soil, but as a rule it is better to supply these in available form as the growth and crop require them, than admix enriching substances, such as horse droppings or farmyard manure with the compost for the borders. When the soil is poor a fifth part of horse droppings or thoroughly decayed manure may be incorporated with the loam.—GROWER.

Scene in Bucklebury Place Gardens.

## Shrewsbury Floral Fête.

(Continued from page 177.)

of 10; harmony, 8 out of 10; general arrangement for effect, 8 out of 10, making a total of 121 points.

With absolutely the same arrangement in the decorations, the second place was awarded to Mr. G. Mullins, gardener to Lady Henry Somerset, Ledbury, who gained 111 points. Madresfield Court Grapes were very handsome in the berry and shape, and one could not grumble at colour and finish. His Melons were excellent, and Peach Barrington, and Dryden Nectarine could not well be beaten. The Figs were behind, and he staged Moor Park Apricots and Gages, as against the Pippins and Pears of his opponent. His Muscat of Alexandria Grapes were creditably finished, and helped him well.

The third award fell to Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., Guisboro', with 109 points, very close on the second collection. The dishes included Souv. de Congrès, and Triomphe de Vienne Pears, with Peaches, Nectarines, Apples, Melons, Apricots, and Grapes.

### CHAMPION GRAPE CLASS.

The interest in this great class for twelve bunches will be understood when it is stated that nine entrants came forward in contest for the magnificent prizes of £20 in cash and a Silver Champion Cup, valued at fifty guineas, given as the leading award. This cup, however, has to be won three times before becoming personal property. Lord Hastings (gardener, Mr. W. Shingles), Melton Constable, Norfolk, was clearly a leader here with an aggregate of 105½ points out of a possible 112. We cannot adequately describe these fine bunches, the Alicantes and Alnwick Seedling, Gros Maroc, and Muscat of Alexandria. Each were massive and deeply coloured. The white Grapes could have been better finished, but consider the season! It would be interesting to learn what the aggregate weight of the dozen bunches amounted to.

With very handsome Muscat of Alexandrias, wonderfully coloured, the Messrs. D. and W. Buchanan, of Kippen, Stirling, N.B., came second, with 98½ points out of the 112. Black Alicante, Alnwick Seedling, comprised the black Grapes here shown, and these were heavy and very finely finished. Capt. Stirling (gardener, Mr. T. Lunt), Keir, N.B., with 95½, was a good third, his Muscats being Al; fourth, J. H. Goodacre, with 93 points; fifth, J. Martin White, Esq. (Mr. R. Cairns), Balruddery, Dundee, with 88½ points; and sixth, Col. Platt, C.B. (gardener, Mr. W. A. Coates), Gorddino, Llanfairfechan, with 87 points. The second prize included £12 and Messrs Wood and Son's special prize of 8 guineas, the other prizes being £10, £7 10s., £5, and £4.

Class 71, for sixteen dishes of fruit, went to T. Corbett, Esq. (gardener, Mr. F. Jordan), Impney Hall, Droitwich, with perfect Melons, a dish of full-sized Oranges, Cherries, Figs, Apples, Gages, Nectarines, Peaches, Apricots, and Pears (Clapp's Favourite, poor). The Grapes were fair. Second came Mr. J. H. Goodacre, with massive Margaret Marrilat Pear, superb Transparent Gages, late Sovereign Strawberries, and other nice dishes in variety. Hon Mrs. Meynell Ingram (gardener, Mr. R. Davies), Temple Newsam, Leeds, formed a close and very excellent third, having Strawberry Wizard of the North, Bananas, beautiful Pears, and other excellent dishes. Fourth, Mr. Cairns, from Dundee; and fifth, Mr. McIndoe, with smaller fruits than the others.

The leading award for twelve dishes fell to Mr. J. Jones, gardener to Mrs. F. Need, York House, Great Malvern, with an even and bright lot; second, Mr. G. Hall, gardener to Lady Louisa Ashburton, Melchet Court, Romsey; third, Mr. Bannerman, gardener to Lord Bagot, Rugeley, Staffs; and fourth, out of five entries, Mr. Bremmell, gardener to H. H. France Hayhurst, Esq., Wellington.

Class 73.—For a collection of nine dishes, open to Salop only, the Rev. T. M. Bulkeley-Owen, Tedsmore Hall, was first; and second, Lord Trevor (gardener, Mr. Daves), Brynkinalt. For four bunches of Grapes, two blacks and two whites, Lord Harlech, Brogyatyn, led, with Madresfield and Muscat of Alexandria, the former very good. Second out of thirteen came Mr. Goodacre; and third, Lady Wantage (gardener, Mr. W. Fyfe). For two Black Hamburgs, Granville Farquhar, Esq. (gardener, Mr. C. Flack), Cholmondeley Castle, led, followed by Mr. Lunt, of Keir. The latter beat Mr. Goodacre for the single Black Hamburg. For two of Madresfield Court, Mr. Shingler led, and C. R. Fielder came second. For two Alicantes, the order was Shingler and Messrs. Buchanan; while for two of either Gros Colman or Gros Mavoc, the order was Wilkins first, and A. H. Hall, Prestbury, second.

### Vegetables.

These, like the fruit, are always a special picture at Shrewsbury, and the chief nurserymen offer liberal prizes for produce

from their seeds. Taking these seriatim, we have for James Carter and Co.'s prizes in class 105, for a collection of nine kinds, Mr. J. Gibson, gardener to R. W. Hudson, Esq., Marlow, Bucks, taking first award. Everything here was good, and admirably set-up. Mr. Edwin Beckett, Elstree, came second with Cauliflowers, somewhat speckled, and rather green-skinned Onions. Leeks, too, were short; other vegetables were excellent.

For Suttons' special prizes, class 106, nine kinds again; Mr. Gibson also beat Mr. Beckett, but there were a number of very fine collections altogether, and some highly creditable produce was staged. Gibson had splendid Supreme Potatoes, all even and smooth; Onions were good for the season; Tomatoes (Eclipse) were excellent; and Sulham Prize Celery was also grand. Third came the Earl of Lathom (gardener, Mr. B. Ashton), Ormskirk, but the staging of them was not so good. Peas, Celery, and Carrots were handsome.

For Edwin Murrell's prizes the leading award fell to Mr. G. Birch, of Shotts Hall; second, Mr. R. C. Townsend, Chalfont Hall, Bucks; third, Mr. S. Bremmell. The above was for eight kinds. For six sorts the awards ran:—First, Mr. E. Clowes, gardener to Mrs. Cook, Ridgebourne; second, Mr. J. Abbott, gardener to C. Gayse, Esq., Hadnall; third, Mr. G. Gilbert, gardener to Colonel Dickin, Wem. Nothing of merit was shown in the first of these classes, but some splendid Celery and Onions were presented in the succeeding one.

For Webb and Son's prizes (class 109) eight kinds distinct, Mr. E. Beckett led, having choice Cauliflowers of the Early Mammoth variety; also Giant White Celery, good Peas, and Progress Potatoes. Mr. W. L. Bastin, Buscot Park, Farringdon, Bucks, followed next, and showed fine Prizewinner Carrots and Stourbridge Marrow Peas.

For Richard Smith and Co.'s awards in class 111 (twelve kinds), the order was Mr. R. A. Horspool, Ruabon, premier, having nice Turnips, Carrots, and Tomatoes; F. Jordon, Droitwich, second; and G. Davies, Pool Parna, third.

For a collection of twelve kinds, in class 124 (open to all), the leading award of £4 went to Mr. Beckett, who staged Early Autumn Giant, Solid Ivory Celery, Green Globe Artichoke, Maltese Parsnip, Ideal Cucumber, Ailsa Craig Onion, Scarlet Perfection Carrot, Jubilee Runner Bean, Improved Telegraph Pea, Windsor Castle Potato, Duke of York Tomato, and Snowball Turnip. These were arranged as we have named them from right to left in three rows, covering a space of 4½ ft square. Second came Mr. B. Ashton, Lathom House, Ormskirk, with good Onions, Canadian Wonder Beans, and Sutton's Masterpiece Peas; third, Mr. W. Pope, Highclere Castle, Newbury, having very fine Onions, Epicure Cucumber, Bloodred Beet, and Supreme Potato. Mr. W. L. Bastin followed fourth. Five entered.

For the nine kinds, Mr. J. Hay, Rayton Park, beat Mr. H. Huxter, of Henley Hall, Ludlow.

The principal prizewinners in the succeeding classes were Messrs. B. Ashton (for Potatoes), A. H. Hall (Tomatoes), E. Beckett (Cucumbers), Jno. Weston and W. Powell (Peas), D. Breeze (Runner Beans), A. Kuddock (Cauliflowers), G. H. Chaunt (Celery), G. Rosebrow (Parsnips), W. Leith (Carrots), R. A. Horspool (Turnips), and E. Beckett (Onions).

Mr. Robert Sydenham, Tenby Street, Birmingham, offers special prizes for dishes of the various vegetables. The competitor who secures the aggregate of points for prizes is entitled to hold a £15 Silver Challenge Bowl for the year. On this occasion the winner was Colonel O. R. Middleton (gardener, Mr. W. Leith), The Chase, Ross, Herefordshire, with thirty-nine points out of fifty. He has won for the second time, and must again do so, when it will become his property.

### Certificates of Merit.

We name the certificated plants, but the tremendous pressure of the throng in the marquees prevented our seeing the novelties in order to describe them. Cactus Dahlia Loogali, from Hobbies, Limited; Cactus Dahlia Winsome, from the same; Cactus Dahlia Mrs. Clinton, from Mr. S. Mortimer; Cactus Dahlia James Bailey, from the same; Lathyrus latifolius grandiflorus albus, from Hobbies, Limited; new Sweet Pea Dorothy Eckford, from the same; Cactus Dahlia Miss Hetty Dean, ditto; Carnation Edward VII., from Bradley, Peterborough; Asparagus myriocladus, from R. Greenfield, jun., Leamington; Tomato Superlative, from Mr. William Bunn.

### Awards for Non-competitive Groups.

LARGE GOLD MEDALS were awarded to the following:—R. Smith and Co., Worcester, for flowering plants; F. Davis, Woolas, Pershore, for Begonias in pots; Blackmore and Langdon, Bath, also for Begonias; B. S. Davis and Son, Yeovil, for Begonias; Leopold de Rothschild, for Water Lilies; Pritchard and Son, for Japanese plants; Veitch and Sons, Chelsea, for Orchids, Ferns, &c.; Dobbie and Co., Rothesay, for Pansies, Potatoes, &c.; Murrell, Shrewsbury, for Roses; Hartland and Son, Cork, for Gladioli, Begonias; and Hobbies, Limited, Dereham, outdoor flowers.

SMALL GOLD MEDALS were awarded to John Russell, Richmond, Surrey, for greenhouse plants; J. H. White, Worcester, for cut flowers; M. Pritchard, Christchurch, for herbaceous flowers; Jackman and Son, Woking, for cut flowers and Dahlias; A. Meyers, Shrewsbury, for Zonal Pelargoniums; W. B. Child, Accrington Green, for hardy flowers; Kings Acre Nurseries, Limited, fruit trees in pots, &c.; Webb and Sons, Stourbridge, for Gloxinias; James and Sons, Shrewsbury, for group; Robert Bolton, Warton, Carnforth, for Sweet Peas; Jarman and Co., Chard, Sweet Peas, vegetables; Hewitt and Co., Birmingham, for herbaceous flowers; Laing and Mather, Kelso, Carnations; and S. Mortimer, Farnham, Surrey, for Dahlias.

#### Non-Competitive Exhibits.

Mr. Henry Eckford, Wem, Shropshire, showed that when small or medium-sized Cactus Dahlias are arranged in slender, tubular glasses with vegetable Asparagus no flowers can be more graceful or effective. We noticed that the glasses were leaded at their bases, to prevent their being overbalanced. Among the varieties shown were Viscountess Sherbrooke, Lord Brassey, Innovation, Debonnair, Major Tuppenny, Green's White, Radiana, Ranji, Starfish, and Primrose Dame, all of which are distinctive and choice. An admirable group.

Tuberous Begonia blooms, in boxes, were contributed by Messrs. Peed and Son, of West Norwood, London, and we know that this metropolitan house grow these plants largely in the open air to show how that doubles even are useful for bedding. Their selection was varied and good, and the blooms clear.

Sweet Peas were sent by various firms, among whom were Messrs. John Derbyshire, Ashley Road, Hale, Altrincham; R. Bolton, Warton, Carnforth; Jarman and Co., Chard; and others.

Mr. H. Deverell, Banbury, staged an interesting group of hardy herbaceous cut flowers, among which were the showy *Helenium pumilum*, a splendid plant for cut-flower uses—"cut and come again." *Lathyrus latifolius*, *Campanula pyramidalis* alba, *Sidalcea malvæflora*, *Campanula Mariesi*, and other things are all worthy of a place in the borders.

Messrs. Jarman and Co.'s Potatoes, Tomatoes, Parsnips, Roses, Dahlias, and Gloxinias attracted attention; and Messrs. Hewitt and Co., of Solihull and Birmingham, with a fine collection of hardy cut flowers, including some especially fine species, further assisted the general interest. Their yellow-ground Fancy Carnations were exquisite blooms, all of them.

A pretty little group of Violas, bunched and staged in tinware vases, furnished quite a fresh and taking display in a large top tent, from Mr. W. Waters, Accrington Green. All the best and most telling sorts for bedding were included.

The Show and Fancy Dahlias (together with Cactus varieties) from Mr. S. Mortimer, Rewley, Farnham, Surrey, were the only flowers in this section of the genus that we noted, and fine they were. Many were full-sized and grand in form, the favourite varieties being included. Among his Cactus sorts were new seedlings of merit, and of these we may hear again.

Hobbies, Limited (Mr. John Green), Dereham, Norfolk, also contributed a display of Dahlias, arranged in pyramidal grouplets, each representing a variety in their usual tasteful style. They had also the beautiful Everlasting White Pea and some Sweet Peas—the newer sorts—with a galaxy of Crimson Rambler Roses and other decorative sorts for the garden. Their *rubrifolia* is a charming Rose for massing in beds; Liberty was also well shown. Cammas and Gloxinias in ether grouplets, but all in line on the same table, completed a formidable and handsome display.

The Scottish firm of Messrs. Laing and Mather (Kelso) were strong in those lovely Malmaison Carnations which they make a speciality of and cultivate to such perfection. Their Princess of Wales, Calypso, and Lady Middleton were exceedingly fine. Border Carnations were here as well, and they were robust-looking, clean, well-coloured, and meritorious generally.

Another group of Violas, from Mr. W. L. Pattison, Shrewsbury, who is a renowned cultivator of these indispensable flowers, demands notice; but the black cloth beneath the sprays of flowers, as used here, did not in any way help the blue and the brown varieties. A complement of Carnation, dressed and with paper collars, was sent by "Thompson's" from Spark Hill, Birmingham. The new *Asparagus myriocladus* was set up by Mr. R. Greenfield, jun., Leamington Spa, and Sweet Peas were also staged.

A delightful collection of Roses—fresh, strong, and well-arranged—was contributed by Mr. E. Murrell, Portland Nurseries, Shrewsbury. His Niphotos, Perle des Jardins, and other Teas and Noisettes (also T.T.'s) were as fine as any we have seen this year; indeed, the whole group deserves the best praise and more space than we can well devote to its description.

The King's Acre Nurseries, Limited, Hereford, sent a representative collection of fruits. A very large group of hardy flowers from Mr. W. B. Child, Accrington Green, seemed to include most of the best of border plants worthy of growing. Phloxes and Pentstemons were arranged by Messrs. I. House and Son, of Bristol.

From Messrs. Jas. Veitch and Sons, Limited, Chelsea, came a magnificent collection of choice specimen plants, arranged with a groundwork of Ferns and Caladiums. A few Orchids and hybrid Rhododendrons assisted in giving colour to the display. The arrangement was carried out splendidly, for each plant could be clearly seen. The Crotons and Dracaenas were all well coloured, and the whole group was greatly admired by the visitors.

Messrs. Webb and Sons, Wordsley, Stourbridge, were as usual represented by a varied and meritorious collection of flowers and vegetables. Taking the latter first, their Early White Mammoth Cauliflowers were such as enticed passing notice. The "heads" were large, even, fine, and white. Webb's Bountiful Cucumber, Sensation Tomato, New Mainstay Peas, Satisfaction Beet, Prize-winner Carrot, Giant White Celery, and Webb's Emperor Cabbage were also excellent samples. Among flowers they had stout Mignonette, Hollyhocks, Sweet Peas, Stocks, Carnations, &c. Their Gloxinias were a show in themselves.

No finer flowers of tuberous Begonias were seen than those from the Erin's Isle (Richard Hartland and Son, the Lough Nurseries, Cork), the blooms being massive and brightly coloured. Most, or all, or them represented named sorts. Of these were Mr. S. Pope, M. Wannot, Orion, Duchess of York, and many others of merit. Among Gladioli were Osmaldi, Enchantress, Mme. Palmer, Vandeal, Baccanthe, and Hercules.

Messrs. Wm. Wood and Son, Ltd., Sundriesmen, Wood Green, London, furnished an attractive exhibit, even if flowers were quite secondary in this case. They staged their "Coronation" floral suspending baskets, which are stout, large, and finely made. Their Perfecta Syringe was also on view, and the new patent hand-sprayer.

Mr. J. Wood, Penrith, had Sweet Peas, and Wood's Centenary new Dwarf French Bean.

Dickson's, of Chester, displayed Phloxes chiefly, and among these were such notable sorts as Amabilis, salmon-pink; Clemena Bouton, rose; Felatante, crimson; Le P. Haequart, violet; Frau S. Buehet, rose-purple, and The Queen, white. They also had Carnations, Crinums, Antirrhinums, Romneys Coulteri, Gladioli, Pentstemons, Iris laevigata (Kämpferi), Montbretias, and other handsome things.

Messrs. Barr and Sons, London, had Water Lilies, Violas, Phloxes, Kniphofias, Reseda alba, Statice latifolia, Pyrethrum, and other border flowers of merit.

Some rare plants from Messrs. Bull and Sons, 536, King's Road, Chelsea, London, included Caladium Gireond, Draena Victoria, Aralia triloba, Anemia rotundifolia (a beautiful subject), Polypodium irioides ramo-eristatum, Draena Lord Roberts, Eugenia myriophylla (bushy and plumose) Ceropegia Woodi, and Asplenium marginatum.

Amongst the "novelties" or new features at Shrewsbury on this occasion was a collection of Potatoes from Dobbie and Co., Rothesay. We counted seventy-six lots, in almost as many varieties, saying which it is unnecessary to go further. The Factor, a new sort, is clean-skinned, even, and more or less kidney shaped. Dobbie's Favourite is another worthy Potato, and so were Duke of Rothesay, Ninetyfold, The Sirdar, Satisfaction, Evergood, and British Queen. They had also Sweet Peas (very robust and large), Violas, and their renowned lemon and orange coloured African Marigolds. Jackman and Co., of Woking, had hardy plants, and Jones and Sons, Shrewsbury, had Sweet Peas.

Mr. B. R. Davis, Yeovil, arranged a grand collection of Double and Single Begonias. The flowers were large, and the plants well flowered. A few of the most striking were Marchioness of Bath, Masterpiece, W. Sparshot, Countess Cromer, Achievement, Clio, and Mabella.

Aquatic plants came from Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury, and a most pleasing change they made, too. The greenery of the Water Reeds and other foliage used as a background, had a fine effect. The Nymphaeas included good bowls of N. marliacea albida, N. tuberosa, N. Andreana, N. Lucida, N. Odorata rosea, N. Ellisiana, N. M. Chromatella, N. Stellata, N. Gloriosa.

Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, contributed a glorious display of double Begonias, nicely arranged with Ferns and foliage plants. The flowers were excellent in every way. The best were Hon. Joseph Chamberlain, Miss Dorothy Hardwieke, Marchioness of Bath, Ida, and W. Sparshot.

It but remains to add that the proceedings all through were well arranged, and that while the attendance was said to be slightly less, everything augurs well for a highly successful record in this, the Coronation year. Quality seems to go on improving, to the great satisfaction of all who are interested in the best horticulture. It is well remarked that no one need show anything but the best at Shrewsbury, and cultivators know it. The joint honorary secretaries, Messrs. Adnitt and Naunton, are as able as they are earnest and enthusiastic, and very great credit is due to them.

The remainder of the report will appear next week.

## Societies.

### Royal Horticultural—Drill Hall, August 18th.

Gladioli from Kelway, pot Plums from Veitch, Crotons from May, and hardy plant groups were the main features of Tuesday's meeting in the Drill Hall. On the whole the exhibition was interesting, though sparsely attended, owing to the holiday season, and the fact that the gentry are now largely out of London. At 3 o'clock Mr. W. H. Patterson, of the Swanley Horticultural College, gave a lecture on "Horticultural Education in England."

#### Floral Committee.

Present: Wm. Marshall, Esq. (in the chair), with Messrs. James Walker, H. B. May, J. Jennings, J. F. McLeod, G. Reuthe, C. Dixon, R. W. Wallace, C. E. Pearson, E. H. Jenkins, W. P. Thomson, J. W. Barr, J. H. Fitt, C. Blick, Geo. Paul, Geo. Gordon, E. T. Cook, Wm. Howe, J. Fraser, and Wm. Cuthbertson.

That Messrs. Storrie and Storrie, of Dundee, are among the most progressive firms in Scotland, we in the south have had frequent and ample proof of late. On this occasion they staged a varied group of *Streptocarpus* (multiflora type), and of named bedding Lobelias; and also *Celosias* and single *Begonias*. The latter were very large and beautiful, the colours highly pleasing. Storrie's *Invincible Lobelia* (a dark blue) is most compact, showy, and floriferous.

Messrs. Ware, Limited, had one of the usually interesting tables with hardy cut flowers, with *Phloxes*, *Lobelia cardinalis grandiflora*, and lovely scapes of *Crinum Moorei*. On the opposite side Messrs. Cannell staged massive bunches of annuals, such varieties as we noted under "Gadding and Gathering" some weeks ago. Mr. H. B. May contributed a brightly coloured collection (ten varieties) of Crotons, grown up to the best market standard.

Another handsome hardy plant group came from Mr. Pritchard, of Christchurch, who always selects imposing bunches of the very finest border plants. We noticed *Montbretia Fiery Star*, *Rudbeckia purpurea*, *Dracocephalum virginicum*, and *Crinum Powellii* among other things. From Barr's, of King Street, Covent Garden, we had a charming contribution of Pansies and Violas, *Phloxes*, *Kniphofias*, *Pentstemons*, and *Watsonia Ardernei* among other things. Mr. Amos Perry, Winchmore Hill, London, N., was another who assisted with hardy flowers.

The only group of Roses that graced and scented the sombre Hall was from Paul and Son, of Cheshunt. They staged *Caroline Testout*, *Johanna Seebus* (H.T.), *Lady Battersea*, now gone very light in colour; Paul's *Cheshunt Scarlet*, a bright and deep red H.T.; with *Killarney* and other varieties in large bunches.

*Cactus Dahlias* from Mr. H. Shoesmith, Westfield, Woking, reminded the visitors that "once again the autumn comes," and leafless woods shall soon be seen. For a handsome new crimson variety named *F. A. Wellesley* he received an Award of Merit. The grouplet included a dozen new sorts.

Messrs. Kelway, from Langport, staged a Silver-gilt Flora Medal group of Gladioli, set up erectly in vases, there being four lines of spikes one behind the other, and occupying an entire table. Some 230 spikes were tabled, and among the newer varieties on view were the following: *Coronation*, which received an Award of Merit; the spike is close and very broad, each flower being large and of great substance. The inside of the throat is flushed bluish, with deep crimson blotches on the under segment. The rest of the petals are white in colour. *Edward VII.* is a handsome scarlet; *Sir Alfred Gaselee*, lilac-purple; *Silver Stick*, bluish and cream-suffused; *Duke of Beaufort*, of enormous size, and coloured salmon-scarlet; *Duke of Norfolk* is another crimson scarlet of merit. In the general collection there were *Winnie Talbot*, *Vivid*, *Remus*, *General French*, *Grenfell*, *Countess Craven*, *Prince Henry*, *Fashoda*, *Cellini*, and *Mrs. Wood*. These present a goodly range of colour.

A beautiful assortment of Hollyhocks were sent by Messrs. Webb and Brand from Saffron Walden, of which the more telling varieties were *Suna*, creamy; *Constance*, pink; *Princess*, deep rose; *Alfred Chater*, deeper still; *Ovid*, of a brighter tint; *Walden Primrose*; and among darks *Exultum*, *Purple Prince*, *Crimson Queen*, and *Black Knight Improved*. Some of the spikes had a dozen full and fresh flowers expanded.

Messrs. Wm. Bull and Sons, 536, King's Road, Chelsea, S.W., sent a fragrant grouplet of *Lilium auratum virginale*, which is very graceful, with a yellow midrib to each white segment and no spots. A lovely flower.

*Ericas* and *Statice* in variety came from Messrs. Hugh Low and Co., Bush Hill Park, N., and they also had some choice Orchids.

A fine collection of Water Lilies was sent by Mrs. Davies Evans (gardener, Mr. Fox), Highmead, Llangbyther, but the

dullness was against their opening. A most creditable contribution.

#### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair), with Messrs. James O'Brien, J. G. Fowler, De B. Crawshaw, Walter Cobb, F. A. Rehder, E. Hill, W. H. White, F. W. Ashton, H. Pitt, W. Thompson, and H. Little.

Messrs. Hugh Low and Co. staged *Cypripedium niveum*, *C. Nandi*, a beautiful hybrid; *Laelia majalis*, *L. elegans*, and *Cattleya Eldorado splendens*. Messrs. Sander and Sons also contributed some nice samples, as also did the President of the Society.

From W. M. Appleton, Esq., Tynycold, Weston-super-Mare, a number of *Cypripeds* were sent. From Mr. H. Little, The Barons, Twickenham, came a nice flower inflorescence of *Laelia crispa*. Others also sent one or two plants.

#### Fruit Committee.

Present: H. Balderson, Esq. (in the chair), with Messrs. Jos. Cheal, H. Esling, Alex. Dean, F. Q. Lane, H. J. Wright, and Geo. Kelf.

His Grace the Duke of Northumberland (gardener, Mr. G. Wythes), Syon House, Brentford, staged Vegetable Marrow Wythes' Prolific, with Melon-shaped, dark green-skinned fruit.

For two dozen odorous Peaches W. W. Shuter, Esq. (gardener, Mr. T. Armstrong), Belsize Grove, Hampstead, received a vote of thanks.

Plum McLaughlin's Gage from Mr. Kelf, South Villa, Regent's Park, also brought him an Award of Merit.

*Monstera deliciosa*, though a very tasty fruit, is seldom seen on show boards, but two fruits came from C. C. Pain, of Haverstock Hill, and were exceedingly large.

Messrs. James Veitch and Sons, Limited, Chelsea, S.W., arranged a splendid group of pot-grown Plums and Gages. These were models of perfect culture, being bushy, well-furnished with stout wood, healthy foliage, and plenty of good fruits; all as clean as could be. The varieties were *Grand Duke*, *Jefferson*, *Golden Transparent*, *Gage*, *Reine Claude Hathem*, and *Coe's Golden Drop*. A finely-grown Wineberry was also exhibited.

#### Medals.

FLORAL COMMITTEE.—Bronze Flora for group of Water Lilies to Mrs. Davies Evans. Bronze Banksian for group of Crotons to Messrs. J. W. Bellgrave, Hammersmith. Silver-gilt Flora for group of Crotons to Messrs. H. B. May, Edmonton. Bronze Banksian for group of plants to P. Purnell, Esq., Streatham. Silver-gilt Flora for collection of Gladioli to Messrs. Kelway, Somerset. Silver Flora for collection of cut flowers to Mr. Pritchard, Christchurch; for collection of hardy plants to Messrs. Ware, Feltham. Silver Banksian for collection of cut Roses to Messrs. Paul and Son, Cheshunt; for group of *Begonias* and *Lobelias* to Messrs. Storrie and Storrie. Silver Flora for collection of cut flowers to Messrs. Cannell and Son. Silver Banksian for collection of Hollyhocks to Messrs. W. Band, Saffron Walden. Vote of Thanks to Messrs. Hugh Low, Enfield, for group of *Ericas*; for collection of hardy flowers to Messrs. Barr and Sons; and to Messrs. Amos Perry.

FRUIT COMMITTEE.—Silver-gilt Knightian Medal to Messrs. Veitch and Sons, Chelsea, for Plum trees in pots.

#### Certificates and Awards.

*Buddleia variabilis* var. *Veitchiana* (J. Veitch and Sons, Ltd.).—Bright heliotrope colour, and the spikes of bloom, 12 to 15 in long, are 3 in broad. A splendid and very choice shrub. (First-class Certificate.)

*Caladium Gircoud* (Wm. Bull and Sons).—Leaves of moderate size, creamy ground, splashed here and there with purple and green. (Award of Merit.)

*Carnation The Shah* (M. R. Smith, Esq.).—A robust, yellow-ground *Carnation*, with deep, bright crimson wedge down the centre of each petal. (Award of Merit.)

*Cattleya* × *Lady Ingram*, Westfield variety (F. Wellesley, Esq.).—Few Orchids have the quality of fragrance, but this beautiful hybrid is peculiarly and attractively odorous. The sepals, which are 4 in long and half an inch broad, are pale bluish; the petals are broader and wavy at the edges, but the lip is exceedingly bright, being a dazzling orange in the main body part, with amaranth at the edge. The extreme edge is fringed and pale lilac coloured. A large flower. (First-class Certificate.) Grower, Mr. F. Gilbert, Westfield, Woking.

*Cordylone indivisa* var. *P. Elder* (P. Elder, Esq.).—A most graceful, narrow-leaved, chocolate coloured variety of excellence. (Award of Merit.) From Forbes House, Ham.

*Dahlia F. A. Wellesley* (H. Shoesmith).—A rich crimson *Cactus* variety, of fair size, and beautifully narrow fluted petals. (Award of Merit.) From Westfield, Woking.

*Gladiolus Coronation* (Kelway & Son).—More after the *Gandavensis* type. The flowers are large and of much substance, mostly white with a rosy throat and deep crimson blotch on the lower petal. (Award of Merit.)

Bird's-eye View of the Grounds at Bucklebury Place.

*Gladiolus Empire* (Kelway & Son).—A Nanceanus cross, with open flowers and rich yellow throat. The general colour otherwise is pale rose, with stripes of purple. (Award of Merit.)

*Kniphofia Rufus* (M. Pritchard).—Very showy, with stout spikes, bright yellow below, reddish at the apex. (Award of Merit.)

*Lælio-Cattleya Ingrami*, *Roslyn variety* (H. T. Pitt, Esq.).—A variety with a superbly handsome lip, large in proportion to the segments, and coloured blackish-purple of velvety texture. The petals and sepals are deep mauve. (Award of Merit.) Grower, Mr. Thurgood, Stamford Hill.

*Senecio clivorum* (J. Veitch and Sons, Ltd.).—A new species (4½ ft) from Central China. Leaves green, and shaped like those of *Petasites vulgaris*. The branched inflorescences bear starry flowers, 3 in across, and coloured deep golden. (Award of Merit.)

### Weston-super-Mare, August 12th.

The showery weather which has dealt hardly with many horticultural fixtures this year, was scarcely less kind on the morning of Weston Show day, though later in the forenoon sunshine helped to make some amends. Unfortunately of late years unfavourable weather and laxity of patronage has gone far to reduce this once flourishing society to a state of despondency, if not of despair. The great excellence of the exhibition itself in every section is well maintained, and exhibitors extending over a large radius contribute to the wealth of the varied display.

In the class for twelve plants, four of which must be ornamental foliaged, Mr. J. Cypher won in his well known style. Mr. Wm. Finch, Coventry, competed for the second prize with good specimens unnamed. With six flowering specimens Mr. Cypher was again an easy first, and also won with six ornamental foliage plants. The Cheltenham nurseries carried away the prizes for single specimens. Messrs. Finch, Coventry; and Hallett, Bath, also competed successfully. With a group occupying 100 square feet, Mr. Finch won well from Messrs. Brooks and Son, Weston-super-Mare. Humcas, very finely grown, were a conspicuous feature in Messrs. Brooks' group. Mr. Cypher's first prize exhibit of Orchids comprised *Lælia elegans*, *Cypripedium Curtisii*, *Aërides Lawrenceana*, and *Cattleya gigas*, and from the same exhibitor came *Cypripedium Callo-Rothschildii*, in a class for a new or rare plant.

Specimen-trained Zonal and Ivy-leaved *Pelargoniums* were numerous, very bright, and well grown, and the same remarks apply also to *Coleus*, *Liliums*, and table plants. Fuchsias and Ferns were poor; indeed, far below the standard of the Bath and Trowbridge Shows.

Roses from Messrs. Perkins, of Coventry, and Messrs. Townsend and Sons, Worcester, were unusually good for the season. Sweet Peas filled a large space, and both their quality and variety were choice. Asters were numerous, though undersized; Dahlias scarce; Carnations, annuals, herbaceous and other cut flowers all very good.

In the first section, quality rather than quantity prevailed, there being marked evidence of the influence of the untoward season. For a collection of eight dishes Colonel Vivian, Rood Ashton, Trowbridge (gardener, Mr. W. Strugnell), was the only competitor, staging Black Hamburg and Muscat of Alexandria Grapes, Stanwick Elruge Nectarines, Sea Eagle Peaches, Brown Turkey Figs, Hamstead Park Melon, Apricots, and Cherries. With four dishes, Colonel Bramble (gardener, Mr. Daffurn), won from three other entries, his Dymond Peaches being exceedingly fine in size and colour. He also won with the same variety the prize for a single dish of Peaches, equally fine. The Rev. A. J. Burr, Uphill, was first with three bunches of Muscats, good in colour and bunch, W. Howell Davis, Esq., Bristol, with Buckland Sweetwater, the first prize for any other white. J. F. Hall, Esq., Wells (gardener, Mr. J. Ayres), won with beautifully finished clusters in the class for Black Hamburgs, and Mr. Daffurn that for Madresfield Court. Mr. Strugnell scored with Nectarines and Pears.

Vegetables were strikingly good; Peas and Runner Beans distinctly so, and there were even greater merit and extent of competition in the cottagers' section than in the open classes. Onions were immense; Cabbages clean and tender; Parsnips and Carrots of ample length; Cauliflowers, despite the bad weather, were good; and Potatoes very superior.

Decorated tables spoke eloquently of the interest taken by ladies in this section of the show, and in the varied choice of flowers and colour blending there was much to admire. Messrs. Perkins' bouquet and floral baskets were marvels of skilful workmanship, and Messrs. Brooks' exhibits in these classes were also of high merit. Mr. Marche, the secretary, and his practical committee deserve from exhibitors much praise for the excellent management in every department of the show.

### Bishops Stortford, August 13th.

Fine weather favoured this important horticultural event of the Eastern counties. The show took place at The Grange, Bishops Stortford, the country seat of John Barker, Esq. The gardens and extensive glass houses were also open to the public, about 7,000 of whom attended the show. Trade exhibits were excellent. Mr. Mortimer, nurseryman of Farnham, showed some grand Cactus and decorative varieties of Dahlias, two of which were new and were awarded certificates. Paul and Son, of Cheshunt, gained first prize for cut herbaceous flowers.

The competitive exhibits for "groups of plants arranged for effect," are always among the first things visitors turn to. The first prize was won by Mr. A. Jefferies, gardener to John Balfour, Esq., Moor Hall, Harlow, Essex, having a splendid arrangement in which *Humea elegans*, *Kalanchoe*, *Campanulas*, *Gloxinias* and *Crotons*, &c., were used with great taste. Mr. W. Clark, gardener to C. Gold, Esq., Stanstead, was second. Mr. W. Harrison, gardener to Colonel Archer Houlton, of Hallingbury Place, third; and Mr. Richardson, gardener to Sir James Blythe, Bart., of Stanstead, was placed fourth.

Fruit is always well shown at Bishops Stortford. Mr. Harrison was well to the fore in a collection of six kinds of fruit; Mr. G. Beech, gardener to John Barker, Esq., was second; and third, Mr. J. Bailey, M.P. In black Grapes of any kind, Mr. Harrison showed grand bunches of Madresfield Court.

Vegetables were well shown, there being six competitors for a collection of twelve kinds. Mr. Jeffries was placed first, with a well set up lot of good quality. Mr. Taylor, gardener to Mrs. Gee, of Bishops Stortford, was second; Mr. Harrison was third.

Ladies' table decorations are always a feature at this show, and there were thirty-six entries. Mrs. G. E. Osmond, of Birmingham, won first prize, and this was of the value of seven guineas; Miss Dickson, of Harlow, was second. Mr. Green, of London, judged the table decorations. Mr. James Douglas, V.M.H., Mr. G. Wythes, V.M.H., Mr. James Vert, of Audley End, and Mr. H. Lister, gardener to Lady Warwick, were the other judges.

### Chippenham, August 13th.

During a long course, extending over thirty years, this society recalls but two wet days, and though the elements were of a sullen nature in the morning of the 13th, the prospects became more favourable later, and a large (though it is said reduced) patronage was shown in the day's receipts. Hardenhuish Park, placed at the disposal of the society by H. E. Clutterbuck, Esq., is an ideal spot for a flower show, ample space and abundant tree shelter being there.

The schedule provides no less than 222 classes in the several sections, though to us many of them appear superfluous because of the repetition providing for the "open" and district severally. The cottagers' section, both in fruit and particularly in vegetables, were pronounced excellent by the judges.

In the class for a group of plants there was a brisk competition, but Messrs. E. S. Cole and Son, Bath, won easily by the superb quality of their material, though the marginal finish did not please the judges. Mr. Bible, gardener to Prince Hatzfeldt, Draycot House, was placed second with an arrangement somewhat stiff in character, but with plants of good growth and variety. Mr. Strugnell, Rood Ashton, was third. The last-named well deserved the first prize for three Palms, Messrs. Cole and Wood and Son, Sudbury, following. Mr. George Tucker, Hilperton proved the victor in the classes for Fuchsias, Ferns, tuberous Begonias, Zonal Pelargoniums, and trained stove and greenhouse flowering plants. Mr. Bible, with excellent table plants, was first, and Messrs. Stokes and Son second.

With thirty-six varieties of Roses Messrs. Cooling and Sons, Bath, were first; Messrs. Jeffries, Cirencester, second. Mr. Hocper, Bath, took the first prize for twenty-four varieties. Messrs. Cray and Sons, Frome, won with each class of Dahlias, and Mr. J. Tucker, Bath, was most successful with Asters, Carnations, Pansies, bunches of cut Geraniums, *Gladiolus*, herbaceous and other cut flowers were well shown by local and distant growers.

Decorated tables were well done. Messrs. Cole and Son, with a choice selection of Orchid blossom, Ferns, and Grasses, proved easy winners. Messrs. Davis and Son, Swindon, were second, also with a choice assortment; Mrs. Woodland, Frome, third.

Fruit was not represented in the same quantity as is customary, and the quality was good. The collection of eight dishes, which last year was keenly contested, found only two competitors. Colonel Vivian, Rood Ashton, being an easy first; B. de Bertodano, Esq., Malmesbury, was second. Dr. Crisp, Corsham, brought beautifully finished Black Hamburgs for the prizes offered for black Grapes, and he also won in the district

section in a similar class. Mr. Strugnell won with three dishes of Peaches and also with Pears. Prince Hatzfeldt, with fine Black Eagle Cherries, easily took the first prize in that class. Apples, Plums, Melons, and other fruits were fairly numerous and good. A particularly good dish of Humboldt Nectarines secured the first prize for T. Harriss, Esq., Calne. Messrs. Blackmore and Langdon, Twerton, staged cut blooms of their famous strain of double Begonias, which were much admired; and Mr. G. Humphries, Kington Langley, contributed an excellent group of Zonal Pelargoniums in pots, in each instance not for competition.

### Dudley, August 13th and 14th.

This recently formed society's horticultural show and fête was held in Buffery Public Park on the above dates. The exhibits were staged in four large marquees, including a bee and honey show. It was about eighteen years ago since a similar show was held in the town, when the ancient and historical Dudley Castle was utilised for the purpose, but owing to unfavourable weather, the financial result was so discouraging, that another attempt in the same direction was not made. However, small successful Chrysanthemum exhibitions have taken place, but during recent years were abandoned. Chiefly through the energy and speculation of Mr. Howard Dickinson, assisted by the chairman of committee and other members, a capital exhibition resulted on this occasion. Unfortunately, however, owing to the unpropitious weather on the first day, the attendance of visitors was very small.

There were 108 classes scheduled, and about 800 exhibits, and the advertised prize money reached £170. Mr. W. Vause, Leamington, secured the first prize in the class for a group of plants for effect, and it proved to be one of his best efforts. The second position was accorded Mr. G. Hancox, West Bromwich, for an arrangement even more elegant than the former, but lacked the richly coloured *Codiaeums*. The third prize was taken by Mr. J. P. Mansell, of Dudley.

For twenty stove or greenhouse plants, twelve in bloom and Orchids excluded, Mr. Vause was to the fore; the second prize going to Mr. J. P. Mansell. Mr. J. R. Horner, Dudley, led for six *Dracenas*, and the second to Mr. W. Manning, Dudley. Fuchsias and Begonias were fairly well shown.

Cut flowers were a fine feature, and in the class for nine varieties of hardy herbaceous flowers, Messrs. G. Gibson and Co., Bedale, Yorkshire, were placed first; while Mr. J. H. White, Worcester, was second, and Mr. W. F. Vernon third. For nine bunches of stove and greenhouse flowers, Mr. J. V. Macdonald, gardener to Mr. J. H. Kenrick, Whetstone, Edgbaston, won with a beautiful exhibit, consisting of two varieties of Japanese hybrid *Rhododendrons*, *Franciscea eximia*, *Nerium grandiflorum*, *Pancratium fragrans*, and *Ixora*, *Lapageria rosea*, *Habrothamnus elegans*, and *Lilium lancifolium rubrum*; second, Mr. W. Vause; and third, Mr. G. Hancox. Roses were fairly well shown for the season. The first prize for twelve blooms (nurserymen excluded) was awarded to Mr. W. F. Vernon. For twelve vases of Carnation, the first prize fell to Messrs. Hinton Bros., Warwick.

For a collection of Cactus or other Dahlias, of which there was an attractive display, Messrs. W. B. Rowe and Sons, Worcester, and Messrs. W. Pemberton and Son, Walsall, were the respective winners with excellent blooms. *Gladioli* formed a fine feature, and the spikes in the first and second winning stands were grandly staged. For twenty varieties, Mr. J. R. White, and G. Gibson and Co., of Bedale, were placed so. For twelve spikes, Mr. W. Waldron was the only exhibitor. For a display of cut flowers and plants, Messrs. W. B. Rowe and Son were placed first, and Mr. F. A. Godfrey second, both with fine displays.

There was a very good exhibition of fruit. For two bunches of black Grapes, Mr. C. Crook, gardener to the Dowager Lady Hindlip, Droitwich, was to the fore with fine bunches and berries of Black Hamburg. For two bunches of white Grapes, Mr. C. Crook was again first, with excellent Muscat of Alexandria; and second, Mr. T. W. Crook, Dudley, with good Buckland Sweetwater. A very fine dish of Apricots, the only one, was shown by Mr. C. Crook. For a scarlet-flesh Melon, Mr. J. R. Horner was first, and Mr. C. Crook second. For a white or green-flesh Melon, Mr. C. Crook was first; and Mr. J. R. Horner second. There was only one exhibit of Peaches, and Mr. C. Crook was the prizewinner. It may be remarked that, especially in the vegetable classes, the names of the exhibits were conspicuous by their absence, a failing which is, unfortunately, not confined to the Dudley Show. Vegetables were, in the majority of instances, remarkably well shown, both in the collections and single exhibits; the chief prizewinners being Messrs. C. Crook, W. Pemberton and Son, W. Pearson, W. Marple, W. Waldron, and G. Hancox. In other classes there was a keen and strong competition, and such as Peas, Onions, Cucumbers, Celery, Cauliflowers, Parsnips and Carrots were very good. The cottagers' classes were also well represented.

Honorary awards were made to Messrs. R. Smith and Co., Worcester; Mr. W. B. Rowe; Messrs. Hinton Bros.; Messrs. Dickson and Co., Chester; Mr. J. H. White; Mr. F. Godfrey; Mr. G. Gibson, Bedale; and Messrs. Hewitt and Co., Solihull, for fine exhibits, principally of hardy garden flowers, Carnations, and other subjects.

### Rock Ferry, August 14th.

The second annual exhibition was held in the Olympian Gardens on the above date. The prizes were sufficient to attract many growers from the Liverpool side of the river Mersey, the entries numbering over 800. Mr. T. B. Kendall, the energetic chairman, Mr. Moffatt, the secretary, and the committee did yeoman service for all present.

Four groups of plants were arranged, the winner being Mr. Geo. Osborne, gardener to Dr. Cook, Tue Brook. Francoas, Orchids, and a rich assortment of foliage plants were beautifully arranged and blended. Mr. H. Ogden, another Liverpool grower, was second; and Mr. Delamore, gardener to E. Johnston, Esq., Bromborough, third. There were two classes of six stove and greenhouse plants, Messrs. Osborne and Ogden winning. Pelargoniums, Fuchsias, Begonias, table plants, and Ferns were of superior quality. Messrs. A. J. Oakshott, J. Roby, F. Powell, J. H. Kenton, E. Johnston, and Mr. D. McLean, gardener to Mrs. Kendall were the prizetakers. For the miscellaneous group of plants (45 sq ft), Mr. H. Morris, gardener to G. Atkin, Esq., scored very highly.

**CUT FLOWERS.**—Eight ladies competed for the table decorations. Mrs. Howell gained the victory with a central basket and four corner vases of *Coreopsis* and *Gypsophila*, *Adiantum gracilimum* and dark *Coleus* forming a tracing over pale-green chiffon. Miss J. Kendall, Lancelyn; Mrs. W. H. Kendall; Mrs. H. Ogden; and Miss F. Oakshott were also chief prizewinners.

Mr. Osborne had a superb collection of indoor flowers. A charming piece of the useful *Oncidium flexuosum* from Mr. Little, gardener to G. H. Pilkington, Esq., could not be denied honours for the single Orchid. Undoubtedly, a feature of the show was the grand collection of Carnations and Picotees shown with their own foliage and buds, and not "dressed." In this, Mr. J. Clarke, gardener to H. D. Trelawny, Esq., Shotwick Hall, scored a splendid victory with perfect flowers of Cecilia, Alexandra, Comet, Goldyllocks, Hidalgo, Lauzan, Aurelian, The Naiad, Bedemere, Bella Donna, and Fair Maid. A good, but flat, arrangement came from Mr. Brownbill; and a third from Mr. J. Bryan, who led for eighteen. Miss F. Oakshott and Mr. J. Clarke had the best collection of outdoor flowers. Rose prizes went to Messrs. Hodgson and Killick.

**FRUIT.**—"Quite perfect," was the opinion of all present, regarding the fruit. Mr. Richards had highly finished Black Hamburgs and Madresfield Court, and there was great competition. Mr. Ferguson defeated all comers for Buckland Sweetwater and Muscat of Alexandria Grapes, Pineapple Nectarines, and a scarlet Melon. The best green-flesh Melon, Sutton's Royal Sovereign, came from H. D. Trelawny, Esq. Hardy fruit was of very great excellence, Mr. C. Irvine winning handsomely.

**VEGETABLES.**—A huge display was brought forward, the winner for nine distinct kinds being H. D. Trelawny, Esq., with fine Ailsa Craig Onions, Magnum Bonum Cauliflower; Dobbies' Purple Beet; Best of All Runner Beans (fine); and Standard Bearer Celery. Mr. Little, gardener to G. H. Pilkington, Esq., Wheat-hill, Roby, was a close second. For Beet, Onions, Runner Beans, and Turnips the former exhibitor led, Mr. Pilkington taking the prizes for Celery, Vegetable Marrows, and French Beans. Mr. Hargreaves won with a capital six varieties. Mr. Carter, a farmer's son, essayed to enter the lists in both sections, and easily secured the single classes for Carrots, Beet (Dobbies' Purple), Alderman Pea, Eclipse Cauliflower, Ailsa Craig Onion, Model White Turnip; and had also six seconds and six thirds. Messrs. J. Lee, W. Coathrup, T. Joynson, and H. Rutter did remarkably well also.—R. P. R.

### Sheffield, August 14th.

This society must be congratulated upon the pluck and perseverance it has exhibited in its endeavours to establish a show on altogether different lines to what has hitherto obtained in the locality. Founded three years ago by the exertions of its secretary, Mr. W. Lewendon, the society at once recognised the importance of open classes, and the well-known exhibitors whose names appear in the prize list is evidence that it is growing in popularity and importance. Unfortunately, it has each year met with unfavourable weather, which has prevented the expansion of the prize list to the extent the committee desired, and a deficit has had to be faced both last year and this. Then, again, while the City authorities are ready to support an agricultural show, both financially and otherwise, it holds severely aloof from a flower show; and while it lends its public parks for the one, takes a great deal of persuasion to do so for the other, and delays its

decision to such an extent that it is tantamount to a refusal. Under these circumstances it is much to the credit of its officials that they have striven to overcome the difficulties, and that a really good show has been the result.

In the class for a group of plants, Mr. J. S. Sharpe, of Valley Nursery, Huddersfield, took first prize with a magnificent collection, much admired for its lightness and artistic arrangement. He had a fine specimen of *Cocos Weddelliana* for a centre, with some capital *Crotons*, *Acers*, &c. Messrs. Artindale and Son came second with a handsome group, in which fine *Crotons* figured, but it was somewhat heavier in appearance; Mr. A. Sheridan, gardener to J. Bassett, Esq., was a good third.

Roses made a good display, and the society aims at having a good Rose competition. Messrs. Harkness and Co., Hitchen,

*Arnica montana.* (See page 171).

staged a grand assortment, which secured first prize and the Challenge Cup; Mr. W. H. Frettingham, of Nottingham, being second, and Mr. H. V. Machin, Worksop, third. In the class for twelve varieties, Harkness and Co. were again first; J. Barrow, Leicester, second; and H. V. Machin third.

For bouquets, Artindale and Son were first, and S. W. Seagrave second. Certificates of merit were awarded to Messrs. Artindale for Fruit, Carnations, and Floral Designs, the latter including some lovely specimens of the florists' art, for which the firm are justly proud. A similar compliment was paid Mr. S. W. Seagraves for Cactus Dahlias; and to Mr. Parkes, of Whittington Hall Gardens, Chesterfield, for a new Melon called "A.R.," which the judges described as "A very good Melon of capital flavour."—R.

As bearing out the remarks by our own correspondent in the above report, we quote from the "Sheffield Daily Independent" the following: "In one respect the society obtains nothing like

the measure of support it merits. The public bodies of the town, to say nothing of large numbers of wealthy citizens figure neither in the subscription list nor amongst honorary exhibitors. Were the Parks Committee of the Corporation and the Town Trustees—to give only two instances—to arrange for the display of some choicer specimens of flowers from the parks and Botanical Gardens, the show of the society would at once become more representative and attractive. At little inconvenience and expense such a scheme could be carried out, and Sheffield could boast of a flower show worthy of the name it bears." In order to help meet the monetary loss, the committee are proposing to have a sale of flowers.

### Dumfriesshire and Galloway, August 15th and 16th.

The show of this society, for the last two seasons under a new directorate, was the most successful it has held since 1862, and the speakers at the opening, and at the judges' luncheon, spoke hopefully of its prospects. This year the show was held on August 15 and 16, in a large marquee at Castledykes, Dumfries, which was filled with a splendid assortment of horticultural produce. The show was gracefully opened by Mrs. Glover, wife of the Provost of Dumfries, who was introduced by Sir James Crichton-Browne, who made an eloquent speech. The premier position was taken by Mr. J. M. Stewart, Mollance, Castle Douglas, N.B., who won the Dumfries Burgh Cup with a beautifully arranged table of plants, Messrs. J. Service and Sons, Maxwelltown, coming second with a fine table. The third went to Mr. J. Houston, Crichton Royal Institution, Dumfries, who had a number of well grown plants, but whose table suffered from flatness of arrangement.

Cut flowers were good for the season, though Dahlias were but poorly represented. Sweet Peas were the flowers of the show, and were beautifully shown by several competitors. Roses were fine, Messrs. D. and W. Croll, Dundee, beating Messrs. Palmer and Son, of Annan, by only a few points, their blooms being larger, though hardly so fresh. The same firm also won easily for eighteen Teas over Mr. Houston.

Hardy flowers were finely shown, and the competition for table decorations was keen, the first and second prizes eventually falling to sisters, the Misses Rutherford, Crichton House, with beautifully arranged tables.

Vegetables were good, and the fruit classes were well contested. Mr. J. M. Stewart's Grapes were splendid, especially the Black Hamburgs, though another first-class fruit grower, Mr. Jas. Duff, Threave, Castle Douglas, ran him closely. There was a large turnout of non-competitive exhibits, Roses being capitally shown by Smith and Son, of Stranraer, and Palmer and Son, of Annan. Thomas Kennedy and Co., Fotheringham and King, James Kennedy and James Service and Sons, all of Dumfries, showed capital plants and flowers, and Mr. Pollock, Tarbolton, Ayrshire, showed examples of his rustic structures for the garden. The services of Mr. R. G. Mann, "Courier" office, Dumfries, the able secretary, are beyond all praise.—A.

### Ipswich Mutual Improvement.

On Saturday, the 16th inst., some seventy or eighty members of the above society had a very enjoyable excursion to Felixstowe. A pleasant stroll along the beach brought the party to The Lodge gardens, where they were met by Mr. Felix Cobbold, who not only permitted the party to view his beautiful grounds, but likewise generously entertained them to tea, this being the first item on the programme. After tea Mr. R. C. Notcutt, as president of the association, expressed the thanks of the party to Mr. Cobbold for his hospitality, to which Mr. Cobbold suitably responded. A tour was then made of the gardens under the guidance of the head gardener, Mr. McIntosh. Although of but small extent, this garden is perhaps one of the most interesting on the east coast, being exceedingly rich in hardy plants. Situated on the top of the cliff, it is protected from the sea by a massive sea wall, while shelter from the wind is obtained by thick belts of shrubs. The face of the cliff is covered with rock-work, on which *Mesembryanthemums* are largely planted, forming large patches, flowering with the greatest freedom. Water trickles down the face of the cliff into a small pool, where the Cape Pond Weed (*Aponogeton distachyon*) is thoroughly at home. No formal bedding finds a place here, but large beds of Roses, herbaceous plants, annuals, &c., make telling masses of colour. One of the latest additions to the establishment is a new kitchen garden, enclosed by substantial walls, on which some young fruit trees were making satisfactory growth. Broad grass walks run round the outside and cross the garden, the centre walk being arched over its entire length, and planted with single cordon Apples. Although the trees have only been planted a year they are making a strong growth and carrying a heavy crop of fruit, giving promise of making a delightful feature of the place. The glass department is thoroughly organised and up to date, both fruit and plants receiving the best attention, reflecting the highest credit on the able gardener and his staff.—E. G.

## THE BEE-KEEPER.

### The Heather Season.

Most bee-keepers are not so favourably situated that they can obtain a harvest from the Heather without moving their bees a distance, and as this is always attended with some risk, a few hints will be of assistance. In the first place, there are numerous conditions which come into play in determining the duration of the Heather season, principally, of course, the quality of the bloom, but as the flow under any circumstances from this source is very short, it will be evident that only the strongest stocks will recoup the owner for the expense of removal. An examination and reduction of hives should, therefore, take place a short time before the journey is undertaken. All brood combs which are filled or partly filled with honey should be replaced with bars of brood from other colonies on the point of hatching. In fact, stocks should be in a precisely similar condition to that in the early part of the year.

To ensure safe transit, the brood combs should be fastened down by screwing a strip of wood, 2in wide, along the ends of the bars on both sides, so that they will not be able to swing and crush the bees. Supers can then be fixed above, and the bees allowed access to the whole tier. By allowing them plenty of room this precaution minimises the possibility of the internal heat of the hive rising to such an extent that there is danger of the combs collapsing and preventing bottom ventilation. It is advisable to place a sheet of cheese-cloth or open bagging over the top of the supers instead of a quilt to provide a current of air sufficient to keep the bees cool. Free bottom ventilation, however, is by far the most important. If the hives are fitted with bottom ventilators, allow them to remain open. If ventilation is obtained by the entrance, open full width and cover with perforated zinc, then tie the supers and hive together securely. Do not spare the rope. It is a mistake to disregard the importance of binding firmly. Laxity in this respect may result in finding, when opened, that one of the most promising hives is nothing but a mass of honey and suffocated bees.

When the distance is great, the method of conveyance should be by rail, but if the journey is short other means will have to be resorted to. There are few people who handle hives as they ought to do. This is where the greatest risk is incurred. Unless care is exercised to keep the bars level they will break and probably ruin the colony. To prevent such a catastrophe have plenty of assistance when loading and unloading, and whatever vehicle is used must have springs with a little play. If too hard, there is a danger of breakdowns when jolting. Should there be any doubt as to the pliability of the springs, pad all the hive legs with hay. This will lessen the vibration considerably. To avoid suffocation there should be at least two-thirds more space allowed than the bees actually occupy. Not otherwise can they be confidently packed. Any hives which cannot be so provided, and thoroughly ventilated, will be better left at home. The journey is better carried out at night when the air is cool. On arrival at destination, if the weather is unsettled, select the most sheltered position on the moor for the hives to stand. This affects the harvest to a great extent. When the weather is settled the position is immaterial.

There is one point which must be mentioned, and that is, that bees have a disagreeable manner of rushing out without marking the spot when excited by confinement. A judicious plan of obviating this is to open the hives at the extreme ends, then the middle one, and when these are settled the others may be released, always liberating those most distance from the flying bees. If all the hives were opened simultaneously, the bees would rush out all at once, and, on returning, probably to the wrong hive, fighting and confusion ensue.

There is a belief that any too much room in the supers is injurious, but if, at the end of July, young queens have been introduced, and the hives are in a normal breeding condition, a little extra room has no ill effect. However, the nights are often colder, and for rapid work it is essential that the heat should be concentrated as much as possible, and everything should be done to keep them warm and encourage work at night in preparation for the following day's honey flow. Seasons are so variable that definite rules cannot be followed. When the weather is exceptionally hot, the bee-keeper should endeavour to visit them frequently, in order to adjust ventilators, and give extra room as required. The honey flow may last a few days or weeks, but there is seldom anything of note after the middle of September.—E. E., Sandbach.

### Hardy Fruit Garden.

**APPLES AND PEARS.**—The season for gathering the early varieties is somewhat late this year, owing to the untoward weather experienced over a prolonged period, and it is doubtful whether even such early Apples as Irish Peach, Red Astrachan, American Mother, and Devonshire Quarrenden have yet ceased swelling, or reached the period when the fruits can be advantageously gathered and stored. Under the best conditions, however, these varieties do not keep long; hence, probably, the most economical method of utilising the fruit is to gather the most forward fruits daily as they become fit, storing only small quantities, until it is compulsory to gather the whole crop. This irregularity in ripening has advantages. There is less strain upon the trees, and the season for the different varieties is prolonged. Early Pears, no less than Apples, are late in maturing, and many fruits are yet hard and green. It is useless to gather any in this condition, as they would not ripen if stored. When, however, the outer skin commences to turn yellow, and the fruits, on lifting carefully to a horizontal position, become readily detached from the spurs, it is then advisable to gather, store, and there finish. When they hang to fully ripen on the trees, the fruits are mealy. The varieties likely to be ready for gathering now are Williams' Bon Chrétien, Citron des Carmes, Summer Doyenné, Jargonelle, and Clapp's Favourite.

**PLUMS AND CHERRIES.**—Heavily-cropped Plum trees will require the branches supporting, for as the fruit gains in size the weight in the aggregate increases, and a strain is laid upon the branches. Some of the early varieties of Plums will have fruits forward enough to be gathered. In doing this the fruits are secured in good condition and the trees relieved. Also remove small and deformed fruits, and give a final thinning to the latest varieties of Plums. These have still several weeks to swell and mature. Water and liquid manure may be given these trees with good effect; also remove superfluous wood, and expose the fruit to light and air. The season for Cherries does not as a rule extend beyond the present month. Gather all dessert varieties as soon as ripe. Morello Cherries will hang for a considerable time after ripening, if protected by nets from birds. The fruit grown on walls is best for this purpose. Fruit is borne the most freely on young wood; hence it is desirable to secure as much as possible, but, without crowding, laying it into the wall now in a temporary way. After the season's crop has been gathered, the bearing shoots may be cut out.

**OUTDOOR PEACHES AND NECTARINES.**—Every encouragement should be afforded trees on walls to thoroughly ripen and perfect the fruit. This can be done by systematic treatment in regulating the growth, laying all the most suitable growths of this year's production which are of medium strength against the wall or trellis. These will be ready to take the place of the discarded shoots which are cut out after the fruit is gathered. The fruits should be removed from the trees before they are fully ripe. They lose nothing in flavour by being finished in the fruit room. The fruits, however, often fall prematurely, and to save them from undue bruising it is desirable to suspend nets below them. After fruit is gathered, the trees may receive a thorough washing with the syringe or garden engine, red spider frequently gaining a footing to a greater or lesser extent during the time the fruit is ripening.

**CLEANING STRAWBERRY BEDS.**—At the end of the Strawberry season beds which have borne fruit freely are apt to be neglected, masses of runners and weeds choking the legitimate plants. This superfluous material ought to be cleared away as soon as possible, reserving any good plants or well-rooted runners so long as it is certain they have originated from fruitful varieties. These may be planted to form new beds at once, or reserved in nursery quarters for later planting, especially if the ground is not ready for their reception. It is important that sturdy plants with bold crowns and healthy foliage only should be employed. In clearing a Strawberry bed, detach the runner wires close to the parent plant. Then the intervening space can be hoed or the useless runners and weeds pared off with a spade.

**PREPARING GROUND FOR STRAWBERRY BEDS.**—As the main lot of new Strawberry beds are usually planted in the course of the next few weeks, the ground ought to be prepared without delay. Nothing short of deep digging and generous manuring, should the ground be poor, ought to be adopted for Strawberries. The best results will in time follow bastard trenching, which consists in moving the soil two or three spits deep,

but not altering the position of the several layers, or burying the top good material, and bringing hungry subsoil to the surface. The manure used ought to be well decomposed, and incorporated with the soil in the course of breaking it up. Ground may be available for Strawberries which has recently in spring been generously treated in respect of manuring and mechanical preparation. This is really better adapted for planting if rich enough, because it has had time to become consolidated. Strawberries like firm, rich ground.—EAST KENT.

### Fruit Forcing.

**VINES.—EARLY FORCED IN POTS.**—The canes intended for starting at the beginning of November must be strong, short-jointed, brown and hard in the wood, with rounded, plump, well-formed buds. Although the leaves may not be off, the Vines will now be at rest, for when the wood is properly ripened, and water not supplied oftener than is necessary to keep the soil from becoming dust dry, and the house or place where they are kept is cool and dry, there is no danger of starting the cane buds, even when the laterals are closely pruned and the shortening effected to about 6ft. more or less, according to the situation of the most promising buds on thoroughly sound wood. The principal leaves will still possess some elaborating power, and the nutriment assimilated be stored in the wood and buds. This makes all the difference between Vines starting strongly and weakly when subjected to the requisite heat and moisture. Vines that mature with clean healthy foliage are the only ones giving satisfactory results when early forced, but this is dependant on their being stored with concentrated nutrition for utilisation in the early stages of their growth under forcing treatment. When the Vines have to be bought, orders should now be placed, or even the canes selected and marked for delivery at an early date. All points considered, there are no varieties equal to Black Hamburgs and Foster's Seedling for early forcing. White Frontignan forces splendidly, but the clusters and berries are too small for marketing. Madresfield Court is one of the best for early work, and when well done commands good prices by its taking appearance and high quality.

**EARLIEST FORCED PLANTED-OUT VINES.**—There is seldom any question as to the ripeness of the wood in the case of early forced Vines. It is different with those not previously subjected to early forcing, but these intended for starting in November or early in December should now have the wood ripe and some foliage, perhaps, falling; but there must not be any attempt at removing it; nor to cut the laterals close in, or that may cause the principal buds to start, therefore remove the laterals by degrees, and shorten some of the long shoots, preserving, however, some growth, especially when the basal leaves are down, the final pruning being deferred until the early part of the next month. In the case of such Vines it is desirable to remove the old surface soil down to the roots and go amongst them with a fork, taking this advantage to raise any that are deep, laying them in fresh material nearer the surface. Good calcareous loam of the red sandstone formation is the most suitable, with an admixture of crushed bones and other opening and enriching substances. If the soil be light, add a sixth of clayey marl dried and powdered, or, if stiff, a similar proportion of calcareous gravel or old mortar rubbish. The thing is to secure a healthy rooting medium, such as will induce fibrous root formation, and keep the roots in a healthy state. This can only be effected with sound materials and thorough drainage. Give a moderate watering, and the roots will push from near the collar into the soil at once, thus the Vines will be in capital condition for starting when the time comes round. When lifting or renovating the border is deferred until the leaves fall, the starting of the Vines is not nearly so satisfactory.

**MIDSEASON HOUSES.**—Midseason Vines delight in a good spread of foliage, every principal leaf having full exposure to light and air, and with these formed under well ventilated conditions, the wood is then stout and short jointed, the leaves thick and leathery, deep green in colour, and the Grapes well nourished, colouring and finishing well, while the wood ripens kindly, being brown and hard, and the buds plump and promising for next season's work and cropping. Copious supplies of water and top-dressings of fertilisers are necessary for the perfecting of the current crop. Mulching light soils materially aids results where water is scarce. Even sewage water may be requisitioned on some places with advantage, but this must not be overdone, for an over-strong dose of fertiliser or liquid manure and needless waterings are the precursors of shanking, which in this, as in most seasons, has been no sinecure as regards giving employment to scissors in removing shanked berries. Sustaining rather than stimulating food is desirable for Vines ripening their crops. Moderate nitrogen supplies aid the Vines immensely in the late stages of the Grapes swelling, but that from blood and bone manure and good all-round fertilisers containing potash, magnesia, and iron is

better than quickly acting nitrates. Fire heat is often necessary to ripen midseason Grapes perfectly, but with ventilation day and night, to ensure a circulation of air, it may often be dispensed with in bright weather. The nights, however, are now getting cold, and fire heat may be necessary, though a good rest at night aids Vines wonderfully that are carrying heavy crops of Grapes. Enough fire heat should be given to maintain the temperature at 60deg to 65deg at night, and 70deg to 75deg by day, allowing 5deg more for Muscats and similar varieties.

**LATE HOUSES.**—The Grapes will now be at the colouring stage or near thereto, and should be given every encouragement. Afford full supplies of water, though a good surface mulching, sweetened horse droppings, or stable litter free from the straw and thrown in a heap, and when hot, turned inside to outside, and top to bottom, answering well when not more than a couple of inches thick, continuing the supplies of nourishment until the Grapes are well advanced in colour, for most late Grapes take a long time to perfect thoroughly, and some are not so up to the shank, even when apparently finished, which is often a consequence of too early stopping the supplies of nutrition, and in some cases the consequences of too short supplies of food and moisture are manifest in the Grapes shrinking, as not unfrequently occurs with Muscats, and in the doings of the Vines the following season. All late Grapes require time, and all ought now to be colouring, or close on, while no harm will come to those advanced therein as regards keeping afterwards. In order to effect perfection of berry in size and finish, a fair amount of air moisture with a circulation of air constantly is imperative, diminishing the air moisture as the Grapes advance in colouring. Poverty of finish is the chief cause of Grapes shrivelling, cracking resulting of a close atmosphere, following a period of drought or ventilating injudiciously. Afford a temperature of 70deg to 75deg by day, 80deg to 90deg with sun, and close sufficiently early to increase to 90deg or 95deg. When the sun is losing power, put on enough top and bottom ventilation to insure the circulation of air, allow the temperature to gradually cool, which rests the Vines, and increase the ventilation early with the advancing temperature. The hot water pipes should, if necessary, have a little warmth in them to prevent the temperature falling below 65deg at night.—**ST. ALBANS.**

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

| Date.            | Direction of Wind. | Temperature of the Air. |           |           |           | Rain.       | Temperature of the Soil.<br>At 9 A.M. |                |                | Lowest Temperature on Grass. |

The week for the most part has been dull with occasional showers; Saturday was an exception, being bright, and warmer than it has been since July 15.

### Trade Notes.

#### Bulbs for the London Parks.

From Mr. W. J. Towner, of H.M. Office of Works, Westminster, S.W., Messrs. Cutbush and Son, have received the following letter:—"I am directed by the First Commissioner of His Majesty's Works, &c., to accept your tender of the 21st inst. for the supply of bulbs for bedding purposes in the coming season to the Royal parks and gardens in the charge of this department."

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bethy—Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**FREE-FLOWERING FUCHSIAS FOR BEDDING** ("Kittie," Dorset).—Of dark varieties the old favourite, Dunrobin Castle, with small dark foliage, producing an innumerable quantity of small coral-red flowers, and, when trained into a standard, makes a lovely feature in floral displays, is perhaps the most distinct bedding variety. Others are Abundance, Duke of Edinburgh, Eureka, Gaiety, Scarcity (weeping habit), Lye's Rival, Charming (dwarf), Wave of Life (golden-coloured-leaved dwarf), Mr. King, and General Roberts (drooping habit). Light: Eynsford Gem, Princess May, Beauty of Trowbridge, Covent Garden White, Minnie Banks, Duchess of Albany, Annie (drooping habit), Rose of Castile Improved (strong habit), and Prince Alfred (strong grower). The hardy varieties: Corallina syn. Exoniensis (good for covering walls and best for open gardens, richly covered in foliage and flower), Globosa (a good old variety, and one of the best hardy kinds), Riccartoni (a beautiful variety, and hardiest of all the outdoor Fuchsias), is severally well worth attention. Of variegated Fuchsias for bedding, Meteor, the lower leaves buff-yellow, the upper ones rich crimson, is, perhaps, most used; but Sunray is by far the best, with red variegated leaves, quite ornamental and beautiful.

**APPLE SPRAYS DISEASED** (X. Z., Sussex).—The young shoots and leaves are affected by the Apple mildew (*Sphaerotheca mali*), which causes them to become white, owing to the powdery white coating of conidia or summer spores, and they ultimately become brown. The mycelium of the fungus is perennial, and the tissues, growing along with the shoots each season, stunting its growth, and eventually greatly injuring or even killing the tree. The mycelium, however, does not extend backward in the branch from the point of infection; therefore, persistent removal of the diseased shoots and burning them soon exterminate the disease, especially if combined with spraying in spring, as detailed for preventing scab, with which the fruit and some of the leaves and shoots are also infested, under "Pears Diseased."

**PEARS DISEASED** (Idem).—The fruits, leaves, and young growths of Louise Bonne of Jersey Pear are affected by the Pear scale (*Fusicladium pirinum*), a parasitic fungus closely resembling in structure and habit Apple scale (*Fusicladium dendriticum*). It attacks the leaves and young shoots, as well as the fruit, first appearing on the leaves in the form of small, roundish dark spots, mostly on the upper surface. These spots soon increase in size and run into each other, forming large irregular-shaped blackish blotches, and when conditions are favourable, such as a cool, damp season, the leaves are frequently killed while quite young, the fruit is retarded in growth, shrunk, and frequently cracked and spoiled by the attacks of the fungus. There is no remedy, but the disease may be prevented by spraying with dilute Bordeaux mixture (loz copper sulphate and loz of freshly burned or quicklime, to one gallon of water), for ordinary-strength Bordeaux mixture is apt to scorch the foliage, especially when young; hence it is advisable to use the dilute form. Spray, first, just as the flower-buds begin to open; second, when the petals of the flowers are falling; and then when the fruit is the size of horse beans or slightly larger. If the season be rainy, a fourth treatment should be given twelve days after the third.

**CLEMATIS JACKMANI GROWTHS DYING OFF** (Wyvern, Twickenham).—The cause of Clematis growths dying off has not been satisfactorily explained, but it usually occurs on recently planted-cut plants, and probably arises from their being planted too deeply, or deeper than they were before, thus affecting the portion of buried stem prejudicially, softening and destroying the stem, though this is usually effected by a fungus, *Pleospora herbarum* var. *Alternariae*, seldom, if ever, observed in plants of quite a healthy appearance, but it undoubtedly exerts its influence some time before it is externally visible. In this period the Clematis tissues become penetrated by the colourless, branched mycelium of the fungus. On this mycelium, near and on the surface of the plant, are formed the conidia, succeeded by the pycnidia and the perithecia conditions. The affected growths become yellowish green, then pale brown, and alternately black, the collapse being from the top, and gradually dwindling away. The best preventive of this is not to plant deeper than the plants have been before, and sprinkle on the ground about the plant air-slaked lime liberally, as well as adding to the soil before planting a dressing of 2lb air-slaked lime per square yard, and mixing well with the soil a spit deep. As young growths spring up from the root it is certain the disease is a stem affection, hence we have found it good practice to remove the soil from about the stems down to where they spring from the rootstock, and leave them bare until they become thoroughly hardened, and, when this is effected, replace the soil.

**HOW TO MAKE MUSHROOM SPAWN IN BRICKS** (J. E. K., Carlisle).—Cultivators of Mushrooms sometimes prepare their own brick spawn, but only a very few as compared with those who purchase it. One of the modes of preparation is briefly as follows: Fresh horse droppings are collected and mixed with fresh cow dung in equal proportions, adding a little adhesive leam to hold the other constituents together. The whole is mixed with liquid stable manure until as soft as mortar, when it is spread on the floor of an open shed until sufficiently dried to form into bricks of 9in long, 6in wide, and 2in deep, there being sixteen of these to the bushel. These should be set on edge, turned frequently, and allowed to get about half-dry. Then a hole is made about 2in from the end of each brick in one side, about an inch square and deep, and filled with a piece of good spawn, enclosing it with a little of a similar substance, the spawn being inserted so deep as to be a little below the surface of the brick. Prepare a bed of fresh, but sweetened, horse dung, about 9in thick, on a dry bottom, and build the bricks in a pile above it, allowing a space between each two, and cover with litter, so as to retain a temperature underneath of 60deg, above which the heat should not rise, and if likely to do so the covering must be reduced accordingly. Under such conditions, the spawn will spread itself throughout the whole of each brick, and the latter must be frequently examined and removed when they are permeated by a white cloudy substance, not so far advanced as to show minute threads. When removed from the hotbed, the drying process should be completed thoroughly, and the bricks stored in a cool, dry place, to arrest any further development of the spawn, until required for use.

**BUNCH OF GRAPES WITH DISEASED BERRIES** (Nemo, North Wales).—The berries are affected by what is known as spot, which first appears as a small, irregular whitish mark on the side of the berry, as if it had been bruised in some way; the pulp dries up, and a sort of contraction occurs, the berry soon assuming a one-sided irregular form. It is caused by the fungus named *Gloeosporium fructigenum* var. *laticolor*, and may be prevented by spraying with ammoniacal solution of copper carbonate, made by forming 1oz of copper carbonate into a thin paste by adding six fluid ounces of water, then pouring on slowly twelve fluid ounces of aqua ammonia, 26deg strength, and, when dissolved, add nine gallons of water, when a clear deep blue solution is obtained. It is also effective against mildew, distributing in the finest possible spray, and so as to coat the foliage and fruit with the finest possible film; and, to be effective, must be applied in advance, of attack. The berries are also affected with scalding, and both this and spot are prevented by careful attention to the ventilation, spot being induced by having the house very close and moist, and then, suddenly, on some bright morning, admitting the external cold air too freely and too abundantly. Albeit, it is the closeness and moisture that has done the mischief, by the moisture condensed on the berries, weakening the cuticle and accelerating the germination and entrance of the fungoid growths. As the berries are worst affected on the north side of the house, we consider the spot and also the scalding arises through late or imperfect ventilation on some bright sunny morning, whilst the internal atmosphere, and even the berries, are saturated with moisture. We do not consider you will gain anything by removing the Vines on the north side of the house and replacing by new ones, unless the roots or border is not satisfactory. Give more air, and earlier, even a little at night, and maintain a gentle warmth in the hot-water pipes, so as to promote a circulation of air; then, we consider, all would be well, other conditions being favourable.

**COVENT GARDEN AGENT (P. W. N.).**—We have placed your communication in the hands of an agent.

**UNITED STATES' GARDENING PAPERS** (Thos. Field).—The horticultural journals of the United States known to us are mainly devoted to the commercial side of gardening. "American Gardening," however, is a journal for the private and amateur gardeners. The address of it is 136, Liberty Street, New York City; five cents per copy, or two dollars yearly to Europe. "The American Florist" is published from 324, Dearborn Street, Chicago, by the American Florist Company. Subscription: two dollars per year to Europe, "The Florists' Exchange" (two dollars to Europe per annum) comes from 2, 4, 6, and 8, Duane Street, New York City. There are others of less importance also published.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (A. J. M.).—The blue papery-like flower is *Statice profusa*. Send the Fuchsias to some large trade grower; we cannot name them. (R. B.).—1. *Veronica longifolia incarnata*; 2. *Campanula persicifolia alba*; 3. *C. elegans*; 4. *C. latifolia*. (J. B.).—1. *Veronica longifolia subsessilis*; 2. *Rhapiolepis japonica*; 3. *Tradescantia virginiana* var.; 4. *Limnanthes Douglasi*; 5. *Hordeum murinum*, the Wall Barley. (J. G.).—1. Scotch Rose, *Rosa spinosissima*. (Alf.).—1. *Galega officinalis*; 2. *Pratia angulata*; 3. *Strobilanthes Dyerianus*; 4. *Miscanthus japonicus zebrinus*; 5. *Eulalia japonica*; 6. *Codiaeum* (Croton) *Johannis*. (W. D.).—1. Tway-blade, *Listera ovata*; 2. *Ballota nigra*; 3. *Solanum dulcamara*; 4. *Solanum nigrum*, the fruits turn black; 5. *Crépis virens*; 6. *Sonchus oleraceus*. (F.).—1. *Lychnis coronaria*; 2. *Eryngium Obverianum*; 3. *E. giganteum*; 4. *Phlomis viscosa*. (A. M., Strilingshire).—They are varieties of *Begonia semperflorens*. (F. T.).—The species *Negundo aceroides*.

### Trade Catalogues Received.

W. Baylor Hartland, Cork.—*Daffodils and Tulips*.  
William Clibran & Son, Oldfield Nurseries, Altrincham.—*Bulbs*.  
Cooper, Taber & Co., Ltd., Seed Merchants, 90 and 92, Southwark Street, London, S.E.—*Wholesale Bulb Catalogue*.  
William Cutbush & Son, Highgate Nurseries, London, N.—1, *Bulbs, Plants for forcing*; 2. *Carnations*; 3. *Strawberry List*.  
Dickson & Robinson, Manchester.—*Bulbs and Roses*.  
Dicksons', 1, Waterloo Place, Edinburgh.—*Flower Roots*.  
H. P. Kelsay, Boston, Mass., U.S.A.—*American Plants and Bulbs*.  
Wm. Paul & Son, Waltham Cross, Herts.—*Bulbs, Camellias, Shrubs for forcing, &c.*  
J. R. Pearson & Sons, Chilwell Nurseries, Lowdham, Notts.—*Bulbs and Garden Requisites*.  
John Peed & Son, West Norwood, London, S.E.—*Bulbs*.  
L. Späth, Baumschule, Baumshulenweg, Berlin.—*Bulbs*.  
L. Späe-Vandermeulen, Exotic Nursery, 92, Boulevard de Jardin Zoologique, Ghent, Belgium.—*Palms and other Foliage Plants*.  
Toogood & Sons, Southampton.—*Bulbs*.  
Vilmorin, Andrieux & Co., 4, Quai de la Mégisserie, Paris.—*Bulbs and Strawberries*.  
Webb & Sons, Wordsley, Stourbridge.—*Bulbs*.

### Seasonable Notes.

So Professor Wrightson heads his interesting weekly paper in the "Agricultural Gazette," and he manages in these papers to touch on much useful matter. We would follow in his steps, but far behind. A friend, a farmer of long standing, is troubling himself sadly on the subject of parasites; he thinks during a long tenancy they may despoil a man of thousands. There have always been parasites; it is part of the primeval curse. Farming would be too easy without these drawbacks. We read of the locust, the caterpillar, the canker worm, the palmer worm, the moth, the lice, and grasshopper. These were the plagues that devastated the crops of the Chosen People. We think now we can add much to the list. Possibly they existed then, but through want of knowledge they were not detected. Wheat, Mangold, and wireworm. What is the cause of such an outcry this season? The wireworm appears to be more to the fore than ever. We see one reason suggested, and it sounds to us a reasonable one. As things are now, the Wheat crop

has decreased in value, as the value of forage or grazing crops have increased. Seeds are dear, and sometimes are a bit shy at growing; but when they do grow their value to the stock farmer is difficult to get at. In consequence of this it has become the practice to let them stand for an extra year, and it is always found when old pasture (and really in some cases the seeds amount to this) is ploughed up, the Wheat crop later is likely to be subjected to the attack of the wireworm. It really comes to this, whether it is better to save your seed bill and labour and secure an extra year's feed, or plough early with the assurance of a Wheat crop. Of course, here the farmer must be his own judge. It used to be the rule to get all seeds ploughed up by August ready for the new Wheat crop; but year by year sees a retrograde movement here. For one thing, as sheep breeding is profitable, the farmer has in view the value to his stock of a good run on old seeds, hence the delay in ploughing up.

Whether wireworm will attack and destroy Mangolds is sometimes a disputed point. The Mangold has many foes. We hear a good deal this season of the eelworm in Oats, for Tulip-like bulbs are forming, and the worm can easily be seen under the microscope. There seems to be no method of cure, only suggested methods of prevention. The insect is so completely shielded in the body of its host that it cannot be got at. Miss Ormerod suggests deep cultivation, rich manuring, and rotation of crops. Now, in a case we know, all these suggestions had been carried out to the very letter, and yet the crop is half destroyed. Professor Wrightson is of opinion cold, wet weather has much to answer for in respect of this plague. The Wheat eelworm is also injurious in cold, wet summers. Unlike the Oat pest, in Wheat it is the ear that is attacked, rather than the stem near the root. Cold nights are much to blame for the prevalence of insect life, that is, injurious insect life, and we really think this summer has seen as many cold nights as that of 1879. That year we began to lead Wheat September 29, and this year in mid-August there seems at present to be little prospect of ripe corn.

If we corn farmers suffer from parasite, what of the poor Hop growers? They seem to spend all their energy and capital in combating aphids and mould. We cannot read one report that is really very favourable, and the acreage is diminished, too, this year. It is said to be the worst attack of aphids that has occurred since 1882. It appears to us with the Hop crop there are far more bad seasons than good. Sir Wilfrid Laurier declares that before long Canada will not only be the granary of Great Britain, but also of the whole of Europe. Is it possible, too, that in the near future we shall depend entirely for our Hop supply from the foreigner? Perhaps in a new country, and under different climatic conditions, a good crop may be more easily obtained. No doubt this year's crop is that of hay. Everywhere the promise of an abundant yield has been fulfilled, and most of it has been got under favourable conditions.

We have before us the report of British farm crops as estimated by the "Times" as they stand now in the fields. The review of the situation as a whole is most favourable. Taking 100 as denoting a full average of healthy quantity, we find the grass crop put down as 102. That is something certainly unusual, for during the last ten years the grass crop has been weak. Wheat, Barley, and Oats are put 96, with a trifling difference in the decimal; roots follow at 95.1. Beans are suffering from a small aphid (parasites again) which has materially lessened the yield, and the weather, too, has been favourable for the production of filth among Peas. Of Hops we have spoken before; "deplorable" is the term applied to their condition by the "Times." Potatoes, too, show signs of disease; and we fear no amount of spraying will check the ravages. We are not quite sure that we absolutely regret disease in Potatoes. It seems a dreadful thing to say, but most growers will allow that in a disease year they make more per acre than when, as last year, there was a plethora. Potatoes, to use a vulgar expression, are "all muck or money," a most speculative crop, save on some of the red lands, where Potato growing always means a very good return. Red land Potatoes "use" so well, and, after all, that is the greatest test of all.

We derive great comfort from the excellent reports of the root crop, i.e., Turnips, Swedes, and Mangolds, throughout the kingdom. Every spring the agricultural papers discuss the question as to whether growing roots is altogether justified by results. It is an expensive business, and the crops by no means a certainty. There are so many difficulties to contend with; unsuitable weather (not only

drought, but ungenial temperature), the ordinary Turnip fly, and sometimes the dreaded diamond back. If the season should turn out wrong, then there is great jubilation among the advocates of forage and root crops; but if the season be as the present, and the prospects continue still favourable, the voice of the malcontents is silenced. For our part we know what terrible destitution we suffer with a "shortage" in the root crop, and we are only too thankful when we look round and see first the good supply of hay (well got), the plentiful pastures, and the regular, even rows of roots. With straw in abundance, this promises, at any rate, to be a good comfortable winter for stock.

We are wondering now how our lambs will weather the next few weeks, and we are also making preparations for the lamb crop of 1903. Some ram sales are over, and although the prices are better a trifle than last year, we do not see the recovery we should like. Ram breeding is an expensive pursuit, calling forth much skill, much patience, and a long purse. We depend on "abroad" for our best customers, and as the South American ports are still closed against our sheep, we fare but badly. We saw the other day that the King was offered a selection from some foreign herd of cattle (some remote district of which the name has slipped our memory), and he, in common with his humblest subject, had to decline, on account of the strict regulations against the importation of live stock. It is a wise rule, and does much to keep home animals free from disease. It is only those who remember in past years the terrible ravages that disease (often imported) has made among us who fully appreciate the desirability of keeping a stringent barrier between ourselves and the cattle of our neighbour.

### Work on the Home Farm.

Passing the village smithy to-day we noticed two reapers about to undergo repairs. Their ancient appearance invited a closer inspection, and a remark to the blacksmith elicited the information that they had been out of use for three or four seasons, and the repairs were likely to be expensive, that the owner had self-binders on his premises, but fearing that the crops would be too heavy for them, was having his old harvesters got ready for any emergency. We fancy that the old self-raker was little more effective than a binder amongst badly laid corn, and when the binder will not work we should prefer to fall back on an old manual delivery machine or the scythe.

We have had very little sun during the past week, and the nights have been cold. The crops have ripened very little, and it must be a September harvest. Such being the case, will farmers be wise to twitch their grain crops tightly with string? It will be very inconvenient to put our string binders away and revert to the old method, but we have some fine crops, and it will be a thousand pities if they are wasted for a matter of 4s. or 5s. per acre. String binding and stooking cost 5s. 6d. per acre at least, without counting horse labour and driving, which would amount to another 2s. 6d. If arrangements are made at once, men can be found to mow and tie up anything which is not really heavily laid, at 12s. per acre. Only experienced farmers can fully appreciate the difference between mown and string bound sheaves when it comes to the stacking process. In Norfolk and Suffolk, where the farmers have always made the most strenuous efforts to get their fine Barley in good condition, it is not considered policy to tie it up at all. We may use the binder for Wheat, but not for Barley or Oats. Whether the weather has been too cold or too wet, certainly Potatoes are not fulfilling their early promise. They do not fill the rows so well as they did. There are no signs of disease here, though they are reported from elsewhere.

Field Cabbage for next summer's use should be sown at once. If an acre of ground can be spared, 4lb of seed will be required, and should produce 100,000 plants sufficient planted out for eight acres. There is still no better kind than Enfield Market if you get a good stock. Drumhead is good for later use, and is a heavy cropper.

### German Sugar Industry.

Last year the Germans produced 1,500,000 tons of raw sugar, representing 13 per cent. of the best root crushed, which was an increase since 1840 from 8,000 tons of product as 5½ per cent. of the material used. The dyeing industry earned \$30,000,000 last year, against \$6,000,000 in 1874, notwithstanding diminished prices and increased wages. Artificial indigo now employs over 6,000 men, including 148 scientific chemists, although started only about thirty-five years ago with less than forty men. In 1898 Germany employed 14,000 persons in making scientific instruments, the exports being three times those of 1888.

### Autumn.

**T**EMPUS edax rerum—Time the devourer of all things. So runs the old motto on an ancient dial. In the hurry and rush of to-day there is little regard for such things. Perhaps it is better so, for to contemplate what has been "Since yonder spheres sublime, pealed their first notes to sound the march of time," seems "Teasing one out of thought as doth eternity." The present, not the past, is our concern; yet, even now, the insatiable maw, "As if increase of appetite had grown by what it fed on," appears to have suddenly absorbed this, our summer of 1892, and it has gone! Gone! Is it premature to judge it? To summarise a summer which, to say the least, has been peculiar. So far as dates are concerned, summer is, of course, still with us; but those who live in close communion with Nature are not much concerned about dates, unless it be one fixed for a flower show which altereth not, and, as worried exhibitors, come in conflict with the Old Dame by urging her on, or restricting her undue haste.

Gardening friends say they never knew a summer that has gone so quick, except some few of short memory, who assert there has been none. Being in agreement with the "gone so quick" section, it is noticeable that not one has a word in praise of the departed, although it is but fair to add that on the principle, possibly, *De mortuis nil nisi bonum*, they say nothing bad of it. Still, the fact remains that to all intents and purposes we are gliding into autumn. Autumn? Yes, so it seems to one who is first in the garden and the last out of it. The face of Nature's floral clock endorses the assumption. Lines of Montbretia are aglow; Asters wear autumnal livery in many hued buttons; dense cushiony

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

heads of *Sedum spectabile* are filling up fast; when these put on the rosy purple, then, indeed, are the passing smiles of autumn at hand, and the all too brief Indian summer brings the glories of a dying year.

In looking back, Roses bloomed with a burst. The first week of July was pre-eminently a Rose week; one week of Roses, and the decline was rapid. Beds of Captain Hayward were superb, and H.T.'s behaved admirably. Now mildew is rife on most varieties, and Captain Hayward nearly loses his commission in our favour by being worst of the lot. What the hero of Rose week loses, however, is gained by Ulrich Brunner in its cleanliness and general good deportment; even where growing in proximity to the mildewed bad company has not corrupted its good manners. The last Rose of summer is still glorious on a many-arched trellis in the form of Crimson Rambler, and the great waggon-whip-like shoots, from 6ft to 10ft high of this year's growth, are as delightful to contemplate as they are to anticipate. Unfortunately there are breaks in the bloom on this trellis owing to some plants of *Aglaia*, the so-called Yellow Rambler, being interspersed. A rambler it is truly, yellow it may be if ever it flowers (has anyone flowered it satisfactorily?); but as for relationship with the Japanese beauty, it has no right, hence "Yellow Rambler" is a misnomer. Any variety of colour borne by legitimate children of Crimson Rambler would indeed be an acquisition.

Grateful is the gold of the large flowered Spanish Broom grown en masse, and how it enjoys the good soil the plants, as seedlings, were transferred to four years since! Never did we have finer clumps and lines of Sweet Peas (transplanted from pots), or a finer display than in mid-July; but the rainbow blaze was suddenly extinguished, in spite of a rigorous exclusion of all seed pods, and they are now flowerless, although there is a wealth of second crop buds breaking from top to bottom, showing that they will be good again. Yet the interval does not please.

Kitchen Peas—well, no need to complain. Some disappointment was felt over Pierremont Gem, a dwarf, and supposed early. However, it came in lately with a profusion of handsome pods well filled with peas of fine colour and flavour, so proves to be a grand midseason sort, ultra useful where stakes are scarce. French Beans have been long delayed; Coronation Day (the real one) gave the first picking of Ne Plus Ultra. Cabbages have kept clean and succulent, which brings to mind there has been no butterflies, and wasps are not yet in evidence, although there was no lack of queens earlier. Our neighbour's bees, too, were watched and waited for over the garden wall when Victoria Plums were in bloom. They came not, so a hair broom was brushed lightly over the blossom, and the set was abundant. Indeed, the only outdoor fruit that one can now regard with satisfaction. Yet Royal Sovereign Strawberries were exceedingly good, although a full fortnight late.

It is, perhaps, too early for comprehensive stocktaking, with its summing up of a season good, bad, or indifferent; but, as before remarked, it has been, to say the least, peculiar. A fine autumn, nevertheless, can do much to redeem that qualified character, and although it will not this year put Apples on our trees, it may garner up the hidden forces of nature for future benefit; and, possibly, it is with us gardeners as it often proves to be with other men who are often happier in anticipation than in possession. This season has certainly shown how little we can depend on orthodox lines or dates in gardening, but the delightful (?) uncertainty of the elements with the widely divergent circumstances of locality, puts men on their mettle—shows the vital necessity of keen observation, and enforces the fact that orthodoxy is the vampire of free thought and action.—A. N. OLDHEAD.

## A Young Gardener's Trip to South Africa.

(Concluded from page 173.)

On arriving at Durban five days after leaving Cape Town, our ship had to anchor outside the "bar," being too large to enter the harbour. As the storm came up, denoting a dangerous "bar," no tug was allowed to come out to us till late in the afternoon, when the exceedingly heavy swell had somewhat abated. We got on to sound footing all right, but not before getting rather a rough heave on "crossing the bar." About once in a lifetime such an experience is quite enough for any man. The delightfully mild climate was appreciated after the wintry weather we braved at Cape Town.

Winter at Durban appears to be as warm as any of our hottest summer days at home. My friend and I decided next morning after our arrival that we would visit the Botanic Gardens. We found Mr. Wyllie, who is an old Kewite, very willing to show us round. The Queen's Jubilee Conservatory is a magnificent building, and was furnished with Tree Ferns, Palms, *Adiantums* (splendid specimens), *Polypodiums*, and *Selaginellas* principally, all in surprisingly good order. A *Cocos plumosa* stood about 20ft high. This is the only house open to the public, but one large private house was filled with a fine batch of *Adiantums* of good varieties. Outside this house were hundreds of young plants of *Crotons*, *Aralia Veitchi*, and *Kentias* in small boxes. Out in the garden there were no lawns like those which we are accustomed with at home. Palm trees of many varieties are planted throughout the grounds and reach from 10ft to 30ft in height. A *Cocos Weddelliana*, 8ft high, looked grand, but we were informed that it required the warmest spot to stand their winter.

Huge plants of *Euphorbia* (*Poinsettia*) *pulcherrima* were a mass of flower, the bracts measuring from 12in to 15in from tip to tip, and I am sure this might be reached at a time at home should the too common system of coddling be given over. Very original was the edging of *Euphorbia splendens*, 9in high, along some of the walks. It is a pity that an edging such as this could not be resorted to for protecting some of our lawns and borders. Large trees of *Acacias*, 20ft to 30ft high, were just coming into flower; but standing out prominently was a magnificent tree of *Acacia spectabilis*, the lovely, silvery foliage of which would soon be hidden from view by the great amount of flowers just beginning to burst forth. Apart from this was a beautiful Silver Tree, 12ft high, standing amidst a strong undergrowth of *Asparagus plumosus nanus*. Then we came to the bed in which Mr. Wyllie sowed the first seeds of the *Asparagus* now known as *A. Sprengeri*, which he found on the Bluff, about two miles distant. Planted at different parts were beds of *Dracenas* of sorts we are acquainted with in our stoves.

Here and there were large plants of *Pandanus Veitchi*, and very odd, too, was *Ravenala Madagascarensis* or Travellers' Tree, from which flows water after a certain incision has been made, and probably many a thirsty traveller has been revived in this peculiar manner. Taking a walk over the Bluff, we found several plants of *Asparagus Sprengeri* and *A. tenuissimus* climbing up some plants of *Lantanas*, 8ft high, and growing wild. These few notes do but give a poor idea of the beauty of this, the finest Botanic Garden in South Africa, seen, as it was, even in the middle of their winter.

Adjoining the Botanic Gardens is Sir Benjamin Greenacre's grounds. The gardener, who is an Englishman, very kindly accompanied us round. Two houses are given over to Ferns, one of which is filled with large plants of *Adiantums*, of the best varieties, and *Gymnogrammas*, mostly. The other house is totally given over to *A. Farleyense*, or Ostrich Feather Fern, and although small plants, they are the finest I have yet beheld, the fronds being fresher and larger than is usually the case at home. A house, 40ft long, is devoted to rockery work, and planted with many varieties of Ferns and *Begonia Rex*. The roof of this house is completely covered with *Cissus discolor*. Orchids are difficult to work, but a small house is furnished with *Cattleyas*, and looked fairly well.

The grounds outside, however, were the eye-openers. Large beds of *Crotons*, beautifully coloured, and from 3ft to 6ft high, were a sight that once seen will not easily be forgotten. *Cannas* had been good but were almost past. *Bougainvillea glabra* and *B. Sanderiana*, used here as a climber, rendered a profusion of flower. Roses do fairly well, but the white ants play havoc at times.

An *Araucaria excelsa*, 60ft high, and a small tree of *Araucaria Cooki*, 12ft high, were the two outstanding features among the trees. Vegetables are difficult to grow in Durban, but the Oranges and Bananas, among fruits, are the finest flavoured I have tasted. A run through the outlying districts showed us acres after acres of Pineapples, Bananas, Oranges, and Lemons being grown for market, and principally for the export trade.—ALPHA.

### Stanhopea Amesiana.

Stanhopeas as named hereunder, will flourish if kept well up to the glass in a warm house in the summer, and they should be liberally watered both at the roots and on the foliage while growing. In the winter they may be removed to cooler and dryer quarters, which will rest the plants and tend to keep insects in check. The species most generally grown are *S. eburnea*, *Bucephalus*, *insignis*, *oculata*, *tigrina*, *Lowi*, and *Wardi*. All of these, with the exception of the first named, have flowers of various shades of yellow more or less spotted or blotched with purple or crimson, while the flowers of *S. eburnea* are wholly of pure white. The newer variety of *S. Lowi* named *Amesiana*, and which we illustrate, was first exhibited by Hugh Low and Co., of Bush Hill Park, Middlesex, in 1893. It is a native of Colombia (*S. America*), and flowers in summer. The blossoms are deliciously fragrant, porcelain white, the inside of the hypophyl suffused with rose."

### Dendrobiums:

#### Their Growth and Culture.

(Continued from page 169.)

The growths push in spring, and from then, onwards, must be encouraged. In autumn they must be thoroughly exposed to sun, air and light, while in winter a complete rest is necessary, the plants being kept almost absolutely dry at the roots—only sufficient moisture being given to prevent shrivelling—and in a cool airy and comparatively dry house. They should remain here until the flower buds show naturally unless wanted early in flower, when they may be given a little extra warmth, but without undue moisture. Kept thus to an annual cycle of growth and rest, they will usually be satisfactory for a number of years, except in the case of a few species difficult to cultivate, which will be noticed in due course.

The evergreen species are very similar in their requirements, but like a more regular temperature winter and summer, slightly more room in the pots, and sufficient moisture to keep the foliage in good order in winter. If room is short in the East Indian or Dendrobium house, these may be easily accommodated in the Cattleya house, or at least the majority of them.

The black and mixed group are usually found to be more difficult to grow for any length of time. For the first year or two after importation they thrive well enough, but usually after this they begin to go back, and when once this backward tendency has set in, nothing will stop it. It is true there are instances where these plants have gone on for many years and increased in vigour rather than declined, but they are in the minority, and I think I should be well within the mark in saying that out of a hundred plants imported, less than ten of them live ten years in this country.

Doubtless it is in the atmospheric treatment we are at fault with this section. Heat and moisture, light and air we can give them, but under a glass roof we cannot supply the ever-changing atmosphere of their native habitat, or discover what is the necessary constituent for their welfare. In a wild state a good many of these are doubtless deciduous, but many of them when introduced to cultivation take on almost an ever-

green habit, and it is wise to let them have their own way in this respect. None of them like a great body of compost, the roots preferring to cling to the rods of a basket, or a rough cork block rather than lie embedded under inches of peat and moss. All like abundant atmospheric moisture, and the species must be allotted their proper temperature as will be noted below, while thrips, their greatest insect enemy, must be rigidly kept down.—H. R. R.

### Hybrid Phaius in Belgian Leaf Mould.

Much has been written of leaf mould culture for all kinds of Orchids. The photo sent is one of our hybrid Phaius, writes A. Dimmock in "American Gardening," of which we now have some thousands. The plant is evidently happy and the roots in perfect health. The fresh green moss and the robust foliage demonstrate that the compost is right. Please note the decided improvement in this season's over the older growth. The plants were formerly grown in loam and peat; the present growth is the result of changing the compost. Many of the

Stanhopea Lowi, var. Amesiana.

plants cannot be removed for repotting without destroying the present pot to save the roots.

There are several varieties of Phaius very easy to cultivate, and one occasionally meets with vigorous plants, but in this instance such difficult growing subjects as *P. Humbolti* and *P. tuberosus* have been used for hybridising, and the progeny grew very slowly until all were placed in leaf mould. I hope to send you shortly a photo of a hybrid Cattleya rooting in a similar way. All our Cattleya and Laelia hybrids—of which we have eighteen houses in St. Albans, England, and Bruges, Belgium—are now grown in leaf mould, and are the admiration of all who see them.

## Bulbs for Early Forcing.

Bulbs for early forcing ought to be potted or boxed within the next week or two, as a frequent cause of failure in early batches is that they are taken into heat before they have sent out plenty of active roots. I know that one may occasionally meet with an individual who professes to be able to manage such matters better than ordinary mortals, they pride themselves on their ability to introduce bulbs into a sharp heat a few weeks after potting has taken place, and yet to get wonderful results. I, however, have never been fortunate enough to achieve success by such haphazard methods; to me the old dictum, "get the roots thoroughly in advance of the growth," appeals as strongly as it ever did, and at present I can see no prospect of Nature reversing the order of her ways in this respect.

If those intended for early forcing are potted now in sweet friable soil, and plunged in cocoa-nut fibre in the open air, by the time the tops have grown an inch or two the soil will have become permeated with healthy roots. Those who have hitherto found a difficulty in getting suitable soil should try cocoa-nut fibre, as nearly all bulbs thrive splendidly in it. Another excellent plan is to mix one-third of this useful material with the potting soil.

White Roman Hyacinths must, of course, be included among the bulbs requiring early attention. During the last two years they have been so expensive that it is a pity a substitute cannot be found: for market purposes there is but little if any money to be made by growing them to supply cut flowers. Those who have bulbs which were forced last year should pick out the best and pack them closely in boxes. If these are brought on steadily they will supply numbers of small spikes suitable for use when making wreaths and button-holes, as large spikes have often to be reduced in size for such purposes. The white Italians come in very useful for spring work. Last spring I saw a fine breadth of the wild white Hyacinth in a wood, and it struck me that if taken in hand and cultivated well it would make a splendid pot plant, and it is quite possible it might force well.

Among the Nareissus, Paper-white grandiflora, and Double Roman, are excellent for private establishments, as they may be flowered with ease by the first week in November, and the latter has cheapness as well as great utility to commend it. Poeticus ornatus ought also to be potted early, although it will not bear very sharp forcing. Ard Righ (giant yellow trumpet), and the Double Van Sion, are well known to be excellent for early forcing, provided the bulbs are potted during August. Where large quantities of cut flowers are required Princeps should be extensively grown, as notwithstanding its low price it is one of the most showy pale yellow kinds, and it forces splendidly.

Tulips, with the exception of a few varieties, are much lower in price than last year, and for flowering from the middle of November till Christmas, I know of nothing better than Due Van Tholl (scarlet), and Rose, the latter variety will usually flower slightly earlier than the former. For an early white L'Immaculée, or a good strain of La Reine, are excellent if really good bulbs are obtained. White Pottebakker comes in a little later, and when it does come, the flowers are superior to the other whites named. The scarlet and yellow Pottebakkers are also splendid for flowering simultaneously with the white type. I have only dealt with a few good things for very early forcing, other notes I hope to add in due time.—H. D.

## Growing Asparagus on the "American Method."

A correspondent writes:—"I have been reading Mr. F. M. Hexamer's book on Asparagus growing in America; what do you think of their plans of not touching the subsoil, but cultivating the top soil very well and growing on the level, plants 3ft apart in the rows, and 4ft between the rows? This would make work easier and cheaper, but could one expect such good returns as in the way you advised me, namely, bastard trenching the ground, and mixing the manure in the bottom spit as well as the top? I am thoroughly satisfied with your plan, but thought that by the other way one could put down a lot of ground quickly. I have four acres of Sainfoin, three years old; I want to get it into form for Asparagus beds. I am told that my best plan, from a farming point of view, is to plough in the Sainfoin and put it down in Wheat; then after I have gathered the crop next year it will be in a much better state for cleaning. There are wireworms in my Asparagus beds, and consequently moles, which make the beds very light; what had I better do? Is there anything that will kill Bellvine?"

[The so-called American method is simply an old-fashioned British practice, there being many acres of land in this country under Asparagus, the subsoil of which has not been broken up, but the top soil being very well done in matters of manuring and tillage, the Asparagus being grown on the level, and the

plants 3ft apart in the rows, and 4ft between the rows. It is a garden plan, to the writer's knowledge, practised over half a century with a view to produce very fine heads. The system is only adaptable where the subsoil is of an open nature, such as sandy, though on very stiff soil it would be worse than worthless bringing up stubborn material, breaking up and leaving being quite a different matter, and then doing the top soil well, fairly good Asparagus may be grown on the so-called American method. Of course the produce will be less in the first two or three years of cutting. We advise the method you have found successful, and as for the four acres now under Sainfoin intended for Asparagus, you could not do better than plough in the Sainfoin, and put the land down in Wheat, then after you have gathered the crop next year we should bastard trench the land, enrich the subsoil as well as the top soil, in every way adhering to our previous advisement. If you like to speculate, you may clean the ground as well as you can after the Wheat, manure and plant in the spring following. It will cost less, but as for the result we take no responsibility, our experience being that nothing pays so well as thorough cultivation.

The wireworm would be best overcome by dressing the ground with mustard leaves, 1½ cwt. per acre, and as for the moles they should be trapped. There is not anything that will kill Bellvine or Bindweed without also injuring other plants, though heavy dressings of salt, 10 cwt. per acre, are useful against it and couch grass. The thing is to free the ground of the roots as much as possible, and keep the tops pulled as often as made, thus weakening the underground part, and ultimately causing its destruction.]

## Notes on Conifers.

Conifers can scarcely be termed town trees, for many of them will not thrive very well in a smoke-laden atmosphere or impure surroundings. Nevertheless, they are often found in gardens in the neighbourhood of large towns, but they are often very sickly looking specimens. Perhaps one reason may be because they are planted in unsuitable positions. One may often notice that they are planted round about dwelling houses and other buildings as a kind of protection or screen, and very often in soil that is not at all suitable. To obtain good specimens of many kinds they must be planted in good soil, that does not get very dry during the summer, and be in sheltered or partly sheltered situations. There are some places in England where most Conifers do well, but in a general way they grow best, I believe, in Scotland, where the climate is more cool and moist during the summer. There are some few species that are suitable for town gardens, but they do not last very long in a healthy condition.

Propagation may be effected in several ways, the most natural method being by seed. When many of the species were first introduced into this country, great difficulty was experienced in obtaining seed. Many that are grown from seed at the present time were propagated by necessity from cuttings. The Pine and Fir tribe are generally raised from seed; several may be increased by cuttings, as well as by seed, such as the Retinosporas, Cupressus, some of the Junipers, and some others. Some are grafted and inarched, and others may be increased by layering. The seed is sown in the spring, March and April being the best months. It takes several weeks for it to germinate; in some cases germination will not take place for one, and even two, years. The young plants of many Conifers grow very slow for the first year or two. A short time since I was shown a bed of Yew seedlings in variety, that was sown in the spring of 1896, and as far as I remember they were only about 2in or 3in high.

Propagation by cuttings should take place in August or September; some kinds may be rooted in the open border, but a more satisfactory way is to put them in a frame, or in pots. The frame should be in a shady position. The cuttings, which must be about 6in long, taken with a heel, be inserted firmly in nice sandy soil. Cuttings put in pots should remain in the frame during winter, where they will get well callused. They may then be introduced to a little bottom heat in spring, when they will soon become well rooted. It will then be necessary to pot them and gradually harden off.

In preparing these notes I have obtained valuable information from Veitch's "Manual of Coniferae." Anyone who may be interested in the culture of these trees and shrubs will find it a great help.—PINUS.

## Notes from Gardening Literature.

(Continued from page 157.)

All sorts of questions are asked in the old-time papers. "Is human urine a beneficial manure?" "Have any experiments been made with milk? If so what is the result?" "I am trying it on two or three Auriculas, and shall let you know

*Nepenthes x mixta.*

(See page 196.)

the effect," the conductor added in a footnote. I failed to find the note in subsequent papers.

The forcing of the Lily of the Valley was well understood in Germany, although little noticed in Britain at this time (1820-40), and I doubt if we have found out anything new about this pretty flower, except it is in the retarding of the crowns, and for that I believe we are indebted to a Dutchman or German.

If there is anyone who has an inclination to excel in the cultivation of the German Aster, here is the way to success:—"If you wish for Asters possessing beauty and magnitude, have the seeds sown in a hotbed by the middle of March, and when sufficiently strong to transplant, remove to the bed where they are intended to bloom. The soil of this bed should consist of horse dung, well rotted, and be turned for the previous six months to the depth of 2ft. Place over this, rich, fresh, strong loam, from an old pasture, with a sixth part of leaf mould, twelve months incorporated. Pare the top spit of a moory pasture, and burn it, spreading the ashes and soil 2ft in height over the subsoil. By observing this plan the Asters will attain a great height and magnitude, and produce a mass of flowers of superior size." The latter article was written by a lady. It appears to me that the roots of the German Asters would have to travel a long way to reach that subsoil of six months old manure.

There was some impostors in these earlier times, but they seem to have come over from France, and gulled our fathers by selling them so-called yellow and black Moss Roses, yellow Camellias, and yellow Lilacs. According to an account the Frenchmen sold £1,000 worth in London alone.

The prices of certain plants are often referred to, and I have no doubt they understood how to make money out of new things as well as we do now. I only give one example. *Poinsettia pulcherrima* was coming into repute about 1836, and the price of a small plant was £2, and of a plant 3ft to 4ft high, was £7 to £10. I previously remarked that some of the articles in the papers were very brief; possibly the pruning knife was applied. Here is an article on *Primula sinensis*, in which the writer, after three lines of preliminary remarks, says: "The compost I make use of consists of rich light loam and peat soil in equal parts. The seeds are sown in the month of May, in a pan lightly covered, and placed in a cold frame. When the plants have formed their first leaves they are transplanted singly into 60-pots. When their roots have filled these, they are then removed into 48's and afterwards into 32's, keeping them in the same situation, and finally into 24's, removing them into the greenhouse in October. It is necessary in all the pottings to give a good drainage of broken crocks or cinders."

Here is a curious method of growing the Hyacinth which some reader might try:—Place a bulb in the bottom of the pot with the growing point or crown through the hole and fill up with soil, placing another bulb on the top of the lower one. Of course the pot has to be suspended in the dark for a time, and also in the room or greenhouse. I was struck on one occasion by a short paragraph about the hybrid *Rhododendrons* as to their hardiness compared with the common *R. ponticum*. I have never seen it stated in print in any recent publications, but I have often remarked about the note in speaking of them, having personally noticed the same thing, and also I notice how much more *R. ponticum* suffers in dry weather, compared with the hybrids, although grafted on to *R. ponticum*.

While living in a certain part of Yorkshire I often heard the villagers speak of the Musk Tree, a name they gave to the common yellow Musk. I came across a note on *Mimulus Harrisoni*, Harrison's Monkey-flower, raised by Mr. Low, of Clapton Nursery, to the effect that it forms a vigorous, branching plant, about 4ft high. Has anyone seen it?

In the Transactions of the Horticultural Society, some very short articles are given in the form of letters to the secretary. On January 7, 1824, some forced Rhubarb was sent to a meeting of the society, and had been forced in the following manner: "The roots were taken up as perfect as possible, leaving the earth which adheres to them still attached. They are placed in a bed of decayed tan, or in boxes, or pots, filled with the same, and set in the Mushroom house, which, by the aid of a flue, is kept at a temperature of 45deg to 55deg. Tan is preferable to leaf mould, because it receives water more freely when given to the plants. After the forcing is finished, the roots are kept under long litter or manure till warmer weather in April, when they are divided by a sharp knife, and planted in a north border, in the open ground. In the following autumn the strongest are fit for forcing again."

The foregoing account is hardly up to the practice of the present day; and the following is how a gardener at Thirkleby, Yorkshire, secured a good crop of Onions by getting rid of the Onion grub. The soil of the garden was very strong. He trenched it in winter, digging in manure at the same time, and left it exposed to the frost in a rough state till the time of sowing. It was then raked without digging, and the Onion seed sown in drills 8in apart. The crops obtained by this practice were not only uninjured, but were of superior size, and had never failed. He sowed his Onions in the middle of February, if the ground was in a fit state to work properly, for the earliest sown Onions are always the largest. I am afraid, however, that the simple remedy of trenching will not always prevent the attacks of the Onion grub.—J. B. S.

#### ***Astilbe chinensis* var. *Davidi*.**

This is another of Messrs. Veitch's introductions through Wilson, their collector in China, and was given a First Class Certificate by the Royal Horticultural Society on August 5. It attains to 3ft and 4ft in height, bearing effective spikes of flower of a reddish-purple colour. On page 197 we reproduce a reduced figure of the plant.

#### **Figs in Borders.**

In replanting, ram the compost, well incorporated, thoroughly about the roots, spreading these out evenly well up to the surface, and with soil between each layer, so as not to have all the roots together. This will ensure a fibrous root formation, steady progressive growth, short-jointed fruitful wood, a solidified soil duly stored with nutrition, securing, with judicious ventilation and management, solidified growth and large heavy fruit. The border may be 2ft in depth. Should the drainage be good, it will only be necessary to detach the roots as advised, confine the roots to the narrow border, and remove some of the old soil from amongst the roots, supplying fresh compost and top-dressing as above stated.—GROWER.

#### ***Cordyline australis*.**

It is the general desire of good cultivators to prevent their foliage plants, such as *Dracenas*, *Codiaeums*, and *Cordylines* from running to flower. At times it is difficult to prevent old plants, or even fairly young ones, from producing their natural inflorescence, the forerunner of fructification and fertility. Nor are the plants inelegant then; on the contrary, we have often admired their exceeding beauty, and *Cordyline australis* has lovely sweet-scented white flowers. From a photograph of a flowering plant by Mr. A. O'Neill, of Dublin, an illustration is presented on page 205. This handsome southern exotic plant is, perhaps, as often called *Dracæna*, as *Cordyline*, maybe oftener, but we have adopted the botanically accepted name.

#### ***Nepenthes* × *mixta*.**

The interesting in *Nepenthes* or Pitcher Plants may vary, but it will always exist. More of them might be added to collections in gardens, while yet many gardens are without any at all. It is certainly the exception to find a collection of insectivorous plants, including *Darlingtonia*, *Dionæa*, *Sarracenæ*, and *Droseras*, in private gardens, and yet how strange these plants are, and how exceedingly interesting! *N. x mixta* is a hybrid as our sign (x) denotes, raised by Messrs. J. Veitch and Sons, Ltd., from *N. Curtisi* and *N. Northiana*, the first-named being the pollen parent. The pitchers are about 8in in length, pale yellowish green, and blotched with red. The mouth of the pitcher is of a deep crimson colour. (See illustration.)

#### **Treatment of Plants Transplanted from Pots.**

Many hardy plants are now grown in pots by florists and nurserymen, and transplanted in summer at convenient times. The risk in transplanting pot-grown stock is very slight if the plants be strong and carefully grown, but they need care, observes "Meehans' Monthly," from the planter when they are set out. The reason such plants transplant safely in the summer season is that, grown in pots the roots are induced to form a ball more or less compact, which is not disturbed in the moving. But the compactness of the ball, in one respect a safeguard, is in a way a danger, as when placed in well-prepared ground it is harder than the surrounding soil, and rain or artificial watering will not properly reach the roots till they commence to grow, and the growing plant will suffer. The prevention of trouble is made easy by soaking the ball in water just previous to the setting. If the ball be not hard, and is to every appearance moist all the way through, such treatment may not be needed, as the watering that follows the planting will be sufficient. It is further desirable, as in every case of planting, to have the soil firmed around the ball of roots.

#### ***Hydrangea* *superba*.**

This is the name given to what appears to be a beautiful hybrid form, the result of *Otaska* × *cyanoclada*. This was first seen in America, where Mr. M. H. Walsh is the raiser of it, about two years ago. It has immense heads of beautiful flowers, the petaloid bracts being very large. Figures of it appear in the American gardening journals.

#### ***Erica* *mediterranea*.**

The small illustration of this hardy and very showy species shown on another page represents a bush which reaches 8ft at its highest point. The photograph was taken by Mr. A. O'Neill, Thomas Street, Dublin, in the Glasnevin Botanic Garden, and though we knew that *Ericas* and *Ericaceæ* in general grow luxuriantly in the sister Isle, we had never heard of *E. mediterranea* reaching 8ft before. Is this a record?

#### **The Importance of Mulching Trees.**

The urgency of cultivating soil about trees is often made impressive by horticultural writers and teachers, while the importance of mulching is less brought to the fore. Soil is cultivated with two objects in view—of conserving moisture and removing weeds. Mulching shades the soil and helps it to retain moisture, fulfilling one of the objects most excellently; and also to some extent it keeps down the weeds. Remove a good mulch from about a tree during a drought, and if there has been any rain since the transplanting, the surface will be seen to be moist and cool. Manure containing an abundance of straw is the best, though plain straw answers most purposes.

#### **Increasing Magnolias.**

The *Magnolias* which seed freely are readily increased by sowing the seeds in early spring, keeping the seeds in a moist condition from the time they are gathered. Some sow the seeds in autumn, some after they are gathered, placing a covering of leaves over them for the winter. But keeping them in slightly damp soil all winter and sowing early in spring is a sure way; of course, watching the seeds right along through the winter to see that everything is right. *Magnolias* may also be grafted, and are increased in this way by many who use the *M. acuminata* stock for the purpose. What suggests the subject now is that the Chinese and Japanese sorts are mostly increased by layering, and this is the season of the year to do the work. Shoots of the present season are used; these root quickly, and by fall will be nicely rooted. Many propagators cut off these layered plants from the parent ones in late autumn, burying them almost completely in some sheltered position till spring, but it is just as well to leave them undisturbed over winter, cutting them off in spring. The only gain by performing the operation in the fall is the getting that much ahead with work.

#### **Hedges of Roses.**

The nurseryman is often asked to recommend some shrub to form a hedge, screen, or thicket. Usually, I think, *Roses* are not thought of; yet there are several sorts unequalled for the purpose by any "shrub." Kewites, or those who have visited Kew, may remember the grand sight some of the clumps of *Roses* make there when in flower. I have in mind (writes Joseph Meehan in an American exchange) a sight of a grand display of *Rosa moschata*, which it was my privilege to see at Kew at one time. Another sight, which "haunts me still," was an arbour-lined avenue of *Rosa setigera*, at Dosoris, Long Island, when William Falconer was in charge of the grounds. To-day I saw a thicket of some extent of the lovely Japanese Rose, *Rosa multiflora*. The thicket was 8ft high, and, covered as it was with thousands of the small white flowers, it was a sight uncommon and beautiful. For a thick, spreading hedge, what equals one of *Rosa rugosa* at this season of the year? Covered with its large single pink flowers, with their background of lustrous green leaves, it is of great beauty. Then it has flowers off and on all the season through. There is the large, healthy foliage all summer long, and, to add to all, the bright red large berries must not be overlooked. Having in mind the sorts *setigera*, *multiflora*, and *rugosa*, all are easily raised from seeds. Gather the berries the last thing in autumn, wash them free of pulp, and place in a cool shed, in slightly damp soil, and they will be in prime condition for sowing outdoors in the earliest days of spring.

## Cucumbers: General Crops.

Shorter days necessitate closing the house earlier, also syringing sooner, so as to have the foliage dry before dark. Fire heat will be necessary in cold weather to maintain a temperature of 70deg to 75deg by day and 60deg to 65deg at night. Keep the growths fairly thin, removing old growths so as to make room for young ones, and so provide a succession of bearing parts. Stop the shoots one joint beyond the fruit unless growth is wanted, then allow more extension, but avoid crowding. Encourage root action by a steady bottom heat of 80deg, surface dressing with lumpy loam and sweetened horse droppings, and afford liquid manure in a tepid state whenever water is required. Do not allow the fruit to hang after it becomes fit for use, and avoid overcropping.

**AUTUMN FRUITERS.**—Afford every encouragement to these plants, stopping so as to insure an even spread of bearing growths. Remove the first fruits if the plants are weakly, and in any case the male blossoms and tendrils. No shading will now be necessary. Avoid syringing in the morning, and only use the syringe on fine afternoons, then early and lightly, keeping the house damped as occasion requires. Admit air in moderation. Aim to encourage sturdy growth by early and judicious ventilation whilst opportunity offers, but without gentle fire heat this is hardly practicable at this season.

**WINTER FRUITERS.**—Seeds having been sown at the beginning of August the plants will soon be ready for to plant out. The house must be a light one, and have means of securing a temperature of 70deg to 75deg in all weather, also of maintaining a bottom heat of 80deg to 90deg. The first consideration is to thoroughly cleanse the house. Plants from seeds sown early in August will fruit in late autumn, but they must not be cropped much, better not at all, if they are to give a plentiful supply of fruit from Christmas to spring.

**CUCUMBERS FOR CHRISTMAS AND ONWARDS.**—For producing these in the crispest and most acceptable form for table use, there is nothing like young plants. Seeds sown on September 1 will do this in light, well-heated, and properly managed structures. Too much strength cannot be got into the seedlings by keeping them near the glass. Everybody has his particular favourite variety. I find a carefully selected form of Rollisson's Telegraph, Rochford, and Cardiff Castle, most satisfactory in crop, solidity, colour, and quality of fruit. The seeds are best sown singly in large 60-sized pots, a little more than half-filled with soil and covered half an inch deep. Keep the plants near the glass, earth them as they grow, and transfer to 48's, when they need a shift, placing a stick to each, to which secure the growth as it advances. Rub off the laterals as they show, training with a single shoot; they will be fit to plant during the first fortnight of October.

**PLANTS IN PITS AND FRAMES.**—The growths of these will need to be trained thinly as a safeguard against damp. Watering must be done early and judiciously, as damp and cold soon injuriously affect the foliage and fruit at this season. A light sprinkling may be given at closing time on bright afternoons; but water will not be much needed after this, or very little of it, the plants obtaining sufficient moisture through the decay of the fermenting material of the beds. The beds must be lined with stable litter, and a little air given at the back to allow of any steam escaping, the temperature being kept at about 65deg at night. There will generally be some warmth from the sun in the daytime, and by employing a covering of mats over the lights on cold nights, with proper attention to the tending and care in management, Cucumbers will be obtained from these structures for many weeks to come.—G. A.

## Peaches: Pot Trees for Forcing.

No method succeeds better than a few select varieties established in pots, such as Alexander and Waterloo, Early Louise, Hales' Early, and Stirling Castle Peaches, with Cardinal and Rivers' Early Nectarines. These afford a supply of fruit during a period of four to six weeks, and if only a few dishes, are welcome in April and May. The trees should now have the wood ripe, and the buds plumped.

If they are in small pots and a shift is considered necessary, repotting must be attended to at once, whilst the leaves are on the trees, being content with removing the loose soil and drainage, shortening any long bare roots, and only giving such pots as will admit of about an inch of fresh soil being rammed tightly round the balls. With judicious watering, the trees soon recover the potting, especially if sprinkled occasionally, and shaded from powerful sun for a few hours each day for a short time; but this is only necessary in very bright weather, and when the roots have been much interfered with. The trees should be continued under glass until the leaves are all down, when, placed on and plunged in ashes outdoors, they will not take any harm, but profit by the cleansing and refreshing autumnal rains, and be in condition for housing in December,

so as to swell their buds gradually and be in flower by the new year or soon after.

**PLANTING FOR EARLY FORCING.**—If new houses have to be filled and fruit is wanted next season at an early period, plant the trees in late summer or early autumn, as soon as the growth is perfected, the foliage and wood being mature. The most suitable trees are those which have been for two or three seasons trained under glass or to south walls, and carefully lifted the previous autumn to ensure a fibrous root formation, and stout, short-jointed, well-ripened wood. Even now, if there be any tendency to a late growth, or any doubt as to the maturity of the wood, the soil should be taken out as deeply as the roots, one-third the distance from the stem that the branches extend on the trellis or wall, and the trench so made ought to remain open a fortnight or three weeks, when it may be filled in again, care being taken that the trees have sufficient water whilst the trench is open.

All that is necessary, however, is to prevent severe flagging. This would effectually check the growth and ensure ripening,

**Astilbe Chinensis Davidi.** (Height from 3 to 4 feet.)

whilst it will materially assist lifting with a ball or mass of fibrous roots. This, and the formation of new fibres after planting, are essential to a good set and satisfactory stoning of the fruit. Plant the trees for early forcing by the end of September, and commence lifting early forced trees as soon as the foliage gives indications of falling. Work of this kind should be performed very promptly.

New borders must have efficient drainage, the bottom of the border being concreted if the soil underneath be unfavourable, or better laid with bricks on flat and run with cement, the border being enclosed in walls, so as to confine the roots. Drains must be provided with proper fall and outlet, rubble being placed over them a foot thick, the roughest at the bottom and finest at the top, and if covered with a layer 2in or 3in thick of old mortar rubbish, the drainage may be considered sound for an indefinite period; indeed, the roots seldom pass the calcareous layer, becoming fibrous and matted therein, and the trees can be lifted and root-pruned as required without interference with the drainage. A border one-third the width of the trellis will be sufficient in the first instance, and 24in depth of soil is ample. The compost should be made firm, as Peaches and Nectarines are healthy and fruitful in proportion to the compactness of the soil. This has special application to soils inclined to be light and porous.—A. B.

# NOTES & NOTICES

## Missouri Botanical Garden.

The thirteenth report of the garden has been issued. It contains the reports of the director and the officers of the Board; also an exhaustive illustrated scientific paper on the Yuccæ, by Dr. Trelease. The number of species and varieties of plants now cultivated in this garden is 9,967. The number of visitors during 1901 reached a total of 91,262.

## Appointments.

Mr. James Williams, for the past four years general foreman at Skelton Castle, the residence of W. H. A. Wharton, Esq., M.F.H., has been appointed head gardener to Col. Chaloner, Guisborough Abbey, Guisborough, Yorks. \* \* Mr. Charles H. Buck, of the Royal Horticultural Society's Gardens, Chiswick, as representative in the north of England and in Scotland, to Messrs. Wm. Bull and Son, nurserymen, King's Road, Chelsea.

## Gладиoli from Langport

From Messrs. Kelway and Son, of Langport, we have received some magnificent spikes of Gladioli, in the following varieties: W. Newcombe, flowers of enormous size (6in either way), and coloured a lovely salmon-pink tint, very distinct and charming; Taunton Deane, strong blooms, close-set spike, colour bright crimson-carmine, with yellowish throat; Shazada, a good amarant-purple Gladiolus, but rather loose-built spike; Lady Wimborne, broad, and finely-arranged spike, flowers large, even, and beautifully opened, colour white, faintly suffused with lilac-purple, and has a bright purple-lined throat; Mayor of Swansea, form rather "raked," blooms good, and coloured deep scarlet, with tea-shaded throat; lastly, Mr. Hobhouse, one of the best in every way, a charming rose-crimson variety.

## Scottish Appointment.

Mr. William Williamson, Tarvit, Cupar-Fife, has been appointed horticultural lecturer for the East of Scotland Agricultural College, Edinburgh. Mr. Williamson has occupied the position of head gardener of Mr. J. Home Rigg of Tarvit for the past thirty years. He has been a very successful horticulturist, as shown by his successes at the Dundee and Edinburgh exhibitions, taking the leading fruit prizes at Dundee for many years. He enters on his new sphere of labour in November, which comprises visiting and lecturing throughout the twelve counties associated with the college, the subjects of lecture being varied to suit the circumstances of the different districts. Mr. Williamson is the author of two important volumes, viz.: "The Horticultural Handbook," and "The British Gardener."

## The Law as to the Use of Barbed Wire.

Inquiries which reach us from time to time would go to show that many of our readers are not aware of the existence of an Act of Parliament under which the use of barbed wire for fences along public roads, streets, or other thoroughfares, leaves the owner open to action for damages for any injuries caused by such wire. For the information of those of our readers who may not be already cognisant of its existence, we may mention that under this Act it is provided that: Whereon land adjoining a highway a fence is made with barbed wire, or in or on which barbed wire has been placed, and such barbed wire is a nuisance to such highway, it shall be lawful for the local authority to serve notice in writing upon the occupier of such land, requiring him within a time therein stated (not to be less than one month nor more than six months after the date of the notice) to abate such nuisance. If on the expiration of the time stated in the notice the occupier shall have failed to comply therewith, it shall be lawful for the local authority to apply to a court of summary jurisdiction, and such court, if satisfied that the said barbed wire is a nuisance to such highway, may by summary order direct the occupier to abate such nuisance; and on his failure to comply with such order within a reasonable time the local authority may do whatever may be necessary in execution of the order, and recover in a summary manner the expenses incurred in connection therewith.

## Our Fruit and Bulb Number.

On the 25th of next month (September), which is the earliest issue after the great Crystal Palace fruit show of which we hope to have a full and interesting report, the *Journal of Horticulture* will be devoted to articles on, and illustrations of, bulbs and also fruit culture. Fruit and bulbs will thus both receive a goodly share of attention, and we can promise a very useful and attractive number. The text and the illustrations will be of a special nature. If our readers can add to the interest of the issue by sending notes for the Readers' Views' page or other department, we shall appreciate their efforts.

## Cassell's Dictionary of Gardening.

This useful publication has now reached the 16th part, and maintains the excellence in point of illustrations which we noted at the start. The condensed form of description is somewhat of a trouble till one practises from the pages, but one must not grumble, seeing each part is furnished for seven bawbees apiece. In dealing with the genus *Prunus*, which includes the Apricot, Plum, Cherry, Peach, and Nectarine, the editor (Walter P. Wright) places each of the species with their botanical name under the English appellation. Thus under Plums, is placed all the species of this fruit, as the Cherry Plum, the Cocomilla Plum, the true Plum, the Bullace, and so on. Garden varieties of *Prunus communis*, the true or common Plum, of course come under the English name. To those who understand the plan, and all should be able to, the arrangement will find favour. This part carries the work up to, and includes part of the dictionary of the Rose.

## The Year, 1901.

As affecting vegetation the weather was chiefly remarkable for the scanty rainfall during the growing period of the year. The deficiency, says Ed. Mawley, in his "Report on the Phenological Observations," was not confined to any part of the British Isles, but was more keenly felt in the English counties than in either Scotland or Ireland. Wild plants came into flower very late, but not quite as late as in the previous year, which was an exceptionally backward one. The swallow, cuckoo, and other spring migrants were, as a rule, rather behind their usual dates in reaching these islands. The crops of Wheat, Barley, and Oats were all more or less above average in Scotland and Ireland. On the other hand, in England, although there was a fair yield of Wheat, that of Barley and Oats was very deficient. Hay proved everywhere a small crop, and especially so in the southern districts of England. Beans, Peas, Turnips, Swedes, and Potatoes were mostly under average in England, but either good or fairly good elsewhere. The yield of Hops proved singularly abundant. Apples, Pears, and Plums were nearly everywhere below average, especially Apples, but the small fruits, as a rule, yielded well. Taking farm and garden crops together, seldom has there been in England a less bountiful year.

## Tree Planting in Shedden Park, Kelso.

With a foresight recognised in all their business dealings, Messrs. Laing and Mather, the King's nurserymen and seedsmen of Kelso, set about some time ago selecting some of their finest standard ornamental trees, planting them in suitable tubs to be in readiness for the demand expected to occur amongst their clients in planting commemorative Coronation trees, or "King's" trees. With a generosity also characteristic of the firm, Messrs. Laing and Mather cordially offered some fourteen of the finest of these trees to the trustees of Shedden Park, to plant in suitable vacancies around the park; also to replace some fallen monarchs that fell in the terrible gale of December 14, 1900. The trustees very readily accepted the offer, and these trees, now permanently planted, being tall and well grown, are already an ornament to the park; but very shortly their beauty and utility will be greatly enhanced as they increase in size and shade. Amongst the trees we were pleased to notice that some of the graceful white Birches (*Betula alba*) were included, also the wide spreading, symmetrical bee-loving Limes or Linden trees (*Tilia vulgaris*), also the gorgeous varied-hued Sycamores, Maples, or Acers, so well known for their autumnal effect. But the "King of the Forest" amongst trees was not omitted; and, in compliance with the express wish of the King for commemorative Oak trees to be planted in public parks in commemoration of the historic event, a specimen of the British Oak (*Quercus pedunculata*) was given a prominent place, and which will be afterwards known as "The King's Tree."

**Death of the late Edinburgh City Gardener.**

Mr. Angus M'Leod, the late superintendent of Edinburgh public parks and gardens, died at his residence, Sylvan Place, on the 20th inst. Mr. M'Leod, who retired in November, 1900, held the position of city gardener for about twenty-five years, his previous appointments being gardener at the seat of Sir W. P. Galloway, Thirkleby Park, near Thirsk; at Burghley Park, the seat of the Marquis of Exeter; at Milton and Wentworth House, the seat of Earl Fitzwilliam; and at Newbattle, the seat of the Marquis of Lothian. During his occupancy of the city gardenership he did much to beautify the city, and when he retired in 1900, members of the Council spoke in high praise of the work he had done. It was while he was superintendent that the Blackford Hill, the Braid Hills, Inverleith, and other parks and gardens were acquired.

**Royal Horticultural Society.**

The Royal Horticultural Society will hold a special exhibition of Dahlias on September 2 and 3 in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, S.W. At this meeting only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 5 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes, see Royal Horticultural Society's "Book of Arrangements for 1902," pages 91 to 93; or separate schedules can be obtained on application to either Mr. J. F. Hudson, M.A., Gunnersbury House Gardens, Acton, or to Mr. C. E. Wilkins, 19, Lyndhurst Road, S.E., joint secretaries to the National Dahlia Society. A lecture on "Hardy Fruits in Yorkshire" will be delivered by Mr. A. Gaut at three o'clock. \* \* At a general meeting of the Royal Horticultural Society, held on Tuesday, August 19, fifteen new Fellows were elected, amongst them being Lily, Dowager Duchess of Marlborough, and Sir Clinton E. Dawkins, K.C.B., making a total of 885 elected since the beginning of the present year. \* \* Intending exhibitors at the Crystal Palace Fruit Show, on September 18, 19, and 20, can obtain an official entry form, together with schedule, on application to the secretary, Royal Horticultural Society, 117, Victoria Street, S.W. (a penny stamp should be enclosed). Entries for this show close on September 11.

**The Fruit Crop in Fifeshire.**

Of recent years considerable progress has been made in the ancient "Kingdom" with small fruit culture, particularly the cultivation of Strawberries, Raspberries, and Gooseberries, and seldom has such difficulty been experienced in making an approximate estimate of the season's crop. With a late, cold spring, leaf and fruit buds were both much belated, and this, followed by excessive frosts and strong gales in May and June, proved exceedingly prejudicial, both to the set fruit and later Apples just in bloom. Plums have come much into favour in some parts of the country, but all over the crop is one of the lightest for years. Here and there the harvest is a complete failure, which is more to be regretted as in recent years many of the growers have been increasing the breadth of this crop, replacing some of the more unprofitable varieties of Pears with the finer kind of Plums. Pears, which have always been a staple production of the north-western districts, are in every case much below the average. Early varieties were blasted with frost, and the finest classes have been getting far too little sunshine for them to have either weight or flavour. The same remark applies to the Apple crop. Their lateness also will depreciate value, and it is computed that the shortage in returns of this year's harvest of Apples, Pears and Plums, will amount to a few hundred pounds, compared with last season, which was only an average one. Cherries are far short of the estimate made some months ago, although ripe samples were received pretty early. Raspberries and Strawberries are much later than last year, the stormy weather of June having retarded their progress. Prices ranged from 1s. to 1s. 3d. per pint. Gooseberries are more prolific than was at one time expected, but caterpillar, fly, and other pests have wrought sad havoc, and the crop is short. The green-crop pulling commenced in the end of June, and commanded only a hardened price, 10s. 6d. per cwt. being the quotation for them. Notwithstanding the very backward weather, Currants

have turned out a good crop on the whole. With a few growers the Black Currant harvest, however, is almost a failure on account of the ravages of the gall mite.

**English Hops.**

The first pocket of new English Hops this year has been produced by a Worcestershire grower, Mr. R. Bagshaw, Plum Leigh, Sinton, near Worcester. Considering the unfavourable season the quality is very good, and perfectly free from disease. The hops, however, are small, showing the extreme lateness of the season.

**Paris Chrysanthemum Show.**

The programme of the general autumn exhibition of the National Horticultural Society of France (Chrysanthemums, fruits, fruit trees, and Legumes in season) has been published. This exhibition will be held from Wednesday November 12 to Wednesday, November 19, in the conservatories of the Cours-la-Reine. Enquiries should be directed to the President of the Society, 84, Rue de Grenelle, Paris.

**Show at Alton, Hants.**

The Alton Horticultural Society held their first fruit, flower, and plant show on Wednesday week in the beautiful grounds of Anstey Manor Park, by kind permission of Gerald Hall, Esq. Entries came in slowly at first, but by dint of some hard work on the part of the president, the hon. secretary, and some members of the committee, a very creditable number was got together, and all the available space in three large marquees was filled. It is twenty-six years since a show was last held in Alton. The sum of £41 5s. 6d. was given in prizes, and over £35 was taken at the gate. The show itself was an excellent one. The outstanding features were undoubtedly the groups of plants in the open section, and the table decorations in section 6. In both of these divisions the exhibitors displayed exceptional taste. Potatoes also made a splendid show, while the vegetables generally were considered very good. The first prize for groups of plants, arranged for effect, was taken by a splendid collection sent from the Manor House by Mrs. Hall (A. H. Campin, gardener).

**Isle of Wight Gardeners' Excursion.**

A fair proportion of members of this new association, including the chairman, Dr. J. Groves, J.P., and the hon. secs., W. Tribbick and A. W. Rime, visited Ventnor on August 21. This picturesque town, with its magnificent views of land and sea was seen at its best. The association are much indebted to these who opened their establishments. The well-kept and extensive nurseries of Messrs. Drover and Son were first visited, and proved a great attraction. Large quantities of Grapes, Peaches, Nectarines, and Tomatoes are cultivated, the latter, despite the season, bearing exceptionally heavy crops. Undermount (H. Mitchell, Esq.), was next inspected. Undoubtedly it is one of the finest and best kept gardens in the island, reflecting infinite credit on the owner, and on the gardener (Mr. Cheal) alike, and with which our members were enchanted. Plants of every description are largely cultivated. A special feature was the spacious and ornate conservatory furnished with huge Palms and choice climbers, growing luxuriantly and eliciting the admiration of all. In one of the fruit houses we noted a fine tree of Stanwick Elruge Nectarine, carrying a good crop of huge fruit, whilst on wall in the open, heavy crops of Plums were fast ripening. Large batches of Azaleas and Chrysanthemums were looking extremely well. Mr. Cheal piloted the party with genial courtesy, and was highly complimented on the cultural skill displayed in his charge. Macrocarpa (Miss Mitchell) is also worthy a visit at any time from horticulturists. Begonias (tuberous) are a speciality; Mr. W. Sheath, the able gardener here, being unquestionably an adept in the cultivation of the showy subjects, as was so clearly demonstrated by the perfect specimens in pots and in the beds and borders in the open. Eucharis, Pancratiums, Ixoras, Clerodendrons, Calanthe, &c., were in robust health, as also were the Chrysanthemums, and free from the dreaded rust. In the fruit garden, clean growing Pears were plentiful. The condition of the place generally spoke eloquently of the gardener's cultural skill, and the keen interest of his employer. Tea being partaken of, generously provided by Miss Mitchell, a walk on the esplanade and public park terminated a most enjoyable outing.

## Rambles in Switzerland.

(Continued from page 168.)

Geology and archæology have taught us from facts—and facts, like figures, are tough evidence, that we have wrongly interpreted the only written record of man's first existence on our globe. Those facts tell that man was here ages before that in which he has been usually thought to have been created. Prominent among those facts are the remains of the Pfahlbauten, or lake-dwellings, in Lake Zurich. That word of ugly aspect is a pure German word, signifying "pile-buildings"—houses on a structure of piles or posts. The inhabitants lived many thousands of years ago, but have left "no record of their date remaining" but the submerged remains of those piles, the stone implements they employed, and fragments of their daily surroundings that have been extraordinarily preserved in the peat formed where water had been below their dwellings. The first discovery of the remains of these dwellings has thus been told:—"In 1853, the inhabitants of Ober-Meilen, a village on the lake of Zurich, availed themselves of the unusual lowness of the waters to reclaim a piece of land from the lake. The excavations disclosed a number of remains of deeply-driven piles, formed of various forest trees. In the mud around these piles the attentive investigation of Dr. Keller detected the remains which threw the first light on the nature of the discovery. There, heaped together, lay stone axes, and hammers, and chisels or celts with their hafts of horn, rude implements for crushing corn, a great variety of coarse pottery, implements of bone, lance and arrow-heads, knives, saws, &c., all of flint, in rich abundance, although flint is not a natural product of Switzerland. Some of the smaller celts, or chisels, are formed of nephrite, a species of transparent jade, a stone imagined to be entirely peculiar to the East. The saws, in particular, are curious examples of human ingenuity under difficulties. They are formed of length in flakes of flint, one edge of which is finely notched, and the other fitted into a neatly formed long wooden handle, the perfect preservation of which may probably be attributed to the antiseptic influence of the peat wherein it had so long remained. A kind of bituminous cement appears to have been used for securing the saw in its handle.

One would like to know how the pile-driving was managed, but driven the piles were, at a distance from 1ft to 300ft from the shore, at a depth of 6ft or 7ft, gradually advancing into deeper water. They were then extended parallel with the shore till the pfahlbau assumed somewhat of the form of a narrow parallelogram. At Morges, on the lake of Geneva, the piles extend 1,200ft in length, by 120ft in width, giving a platform surface of some 18,000ft. On this M. Troyon calculates that some 316 cabins may easily have stood; which, only allowing four persons to a cabin, would give a population of 1,264. On these piles, driven at short intervals, was laid a platform on which stood the cabins, constructed, as there is good authority for believing, of wattled work plastered with clay. From the extraordinary number of reliques found it is supposed the planks of the platform were not set close together, and that things were hence continually falling through; but there would scarcely appear need for such an hypothesis. It is clear that the great mass of pfahlbauten were fired, purposely or accidentally. In buildings so constructed fire would spread too rapidly to allow the inhabitants to save much of their property, which accordingly would sink to the bottom of the lake. Indeed, the carbonised state of many things, especially the vegetable products, has preserved them for the examination of modern science.

In the masses of carbonised grain discovered at Wangen and elsewhere, Professor Oswald Herr recognised several cereals—*Triticum vulgare*; *Triticum dicoccon*; also *Hordeum distichon*, and *Hordeum hexastichon*. The pfahlbauten of Wangen and Robenhausen have also furnished abundant examples of a coarse bread savouring rather of bruised corn than meal. It was probably baked on hot stones, and covered with hot embers, just as in the Rigsmal Saga 'Edda drew out from the embers a bread cake, heavy, sticky, and full of bran.' In the same pfahlbau, too, were stores of Apples and Pears cut into halves and quarters, and dried in the sun for winter food. The custom holds in Switzerland to this day, and these dried Apple cuttings are sold by measure in the markets under the name of *scnitze*. From the size of some of this carbonised fruit it would appear

that the Apples must have been of a cultivated kind, so these people were acquainted to a certain degree not only with corn, but with fruit culture.

Flax and hemp they certainly had, and the means of spinning it, which was of the last necessity for their nets. Nothing exists to show any knowledge of the art of weaving, but they contrived to manufacture a coarse flaxen plaited material. In addition to their other means of subsistence they had always the lake at command, and the great variety of fish-hooks discovered shows that they knew how to take full advantage of it with the line as well as the net.

Great, indeed, was the interest with which I inspected the numerous relics of Pfahlbauten preserved in the Zurich museum. The sharpened ends of the piles, I think, show that they were of a Coniferous tree, probably *Abies excelsa*. The Apples, halved, are black masses; they were evidently carbonised by exposure to intense heat whilst the air was excluded. They were probably stored in close vessels. The pulp is black, a mere mass of charcoal; the core is somewhat paler, and the pips are quite distinct, as shown in this portrait of one.

What thoughts crowd upon one! What reflections that we are looking upon forms that other human eyes looked upon, since which so very many thousands of years have passed! Then, probably, as now, a winter store of dried fruits was essential for the preservation of health. I pondered over the uninterrupted succession of Pear, Cherry, Walnut, and Apple trees that margin all the roads in the Swiss valleys, and wondered what could be done with their produce. I at last was told. In winter the dried fruit is almost the only vegetable produce, except bread, that is available to mingle with their animal food. In some alpine districts that animal food is only such as has been salted, and the consequences have been told by the Rev. Mr. Macmillan in his most interesting little volume, "Holidays on High Lands." Speaking of the monks of St. Bernard he says: "During winter they have no fresh meat, being obliged to subsist upon salted beef and mutton, usually killed and preserved in September, and, which is worse still, they have no vegetables, all attempts at gardening in the place having proved abortive, so that not unfrequently scurvy is added to their sufferings."

The fruit of the Cherry, including the stone, is crushed, fermented, and a spirit distilled from the mass, so potent and pleasant, that it is degraded by being named, as it is named—"Cherry-water"—Kirschwasser.

In the Zurich museum are preserved many other relics besides those of the lake-dwellers; but I must not linger here over "The Twelfth-day Queen," Jane Gray's neatly-written letters to Bullinger, nor to the "infirm-of-purpose" looking scrawl of Cranmer; but I note more fittingly for your pages that there are original and very satisfactory portraits of Conrad Gesner, Scheuchzer, and Lavater.—W. J.

(To be continued.)

## Summer Bedding: Plants and Arrangements.

When our country became more prosperous and wars abroad had for the period ceased, a new style of flower-gardening became adopted in the third decade of last century. It became the desire of the gentry and the object of their gardeners, to ensure a brilliant, massed display of certain summer-flowering plants, arranged closely and all of one sort in formal beds on parterres. In these days, when the octogenarians William Paul and Robert Fenn were little more than infants, the gardeners of Britain had an extremely limited selection of plants wherewith to work, for hybridism had only then been started, and type plants (species) were confined to the South African Pelargoniums and Succulentæ, with Mignonette, *Hydrangea hortensis*, Lee's Fuchsia, and *Calceolarias*; probably also Lobel's little blue flower (*Lobelia*) which poisons (?) the sheep in its Australian home. But with some of these a beginning was made, and was so effective, that eventually the gardeners became enamoured at the brightness and trigginess of their yearly efforts, vying the more to place a design of greater intricacy, and in colours more gaudy, before the eyes of their patrons, till at length the carpet-bedding style was evolved, and developed to unreasonable extremes. Efforts now veered to the production of subdued effects, and what the horticultural historian records as the neutral style, came into being, this giving place in later times

ALLAMANDA WILLIAMSII.

to sub-tropical bedding, so liberally practised in London parks and elsewhere to-day.

Summer bedding is now a speciality. It has been so for long, but as many more parks are yearly added to our cities, and as the public clamour ever the more for "sights," our park superintendents and gardeners after them, seem to be giving no less, but greater attention to the summer floral and foliage arrangements as features of their grounds.

While we do not desire a return to that monolatry, current for so long, we should still feel pleasure in knowing that the directors of private gardens entered more fully and with spirit into the art of summer bedding, that its perfection might be the nearer. So many gardens are under-manned, and the best in this phase of gardening cannot be attained without persistent and ample attention, that at once a large percentage of places must be subtracted from investigation, on this account alone. The gardener feels that it is simpler and better for him to fill his beds with Pelargoniums (or Geraniums as he calls them), Calceolarias, Petunias, Begonias, or Verbenas, and have little more trouble with them, than to evolve a "sub-tropical" creation of the most perfect gracefulness and colour harmony, but which demands much labour in pinching, staking, and watering.

From the notes which I have gathered just recently, in a visit to some of the leading London parks where bedding is pronounced to be the pattern to be modelled from, it will be seen that there are many extremely simple arrangements, demanding quite as little labour as the "Geraniums" do, and are equally effective (perhaps more so), and have this great merit that they will be fresh and novel in a great many gardens.

So many inquiries have been sent to this office for advice on sub-tropical gardening, that a list of the chief plants employed in the larger arrangements may be found serviceable. After that I will record, in brevity, the subjects which contrasted or harmonised to good effect in beds which have been viewed. The following is a list of plants suitable for sub-tropical beds, and employed generally for the sake of their graceful character and brightness:

#### FOLIAGE PLANTS FOR SUB-TROPICAL BEDDING.

|                                      |                                       |
|--------------------------------------|---------------------------------------|
| Abutilon Savitzi                     | Fatsia japonica                       |
| " Thompsoni                          | Ferula communis                       |
| Acacia lophantha                     | Ficus elastica                        |
| Acalypha Macfeeana                   | Glyceria aquatica, fol. var.          |
| " musaica                            | Grevillea robusta                     |
| Amaranthus superbus                  | Humea elegans                         |
| Areca lutescens                      | Iresine Herberti                      |
| Aralia (see Fatsia)                  | " Lindenii                            |
| Araucaria excelsa                    | Kentia Belmoreana                     |
| Artemisia arborescens                | " Fosteriana                          |
| Arundo Lindleyana                    | Latania borbonica                     |
| Asplenium bulbiferum                 | Ligustrum ovalifolium variegatum      |
| Beta chilensis                       | (Golden Privet)                       |
| Bocconia cordata                     | Melanthus major                       |
| Calocasia antiquorum                 | Musa Ensete and others                |
| Cannabis gigantea (Hemp)             | Oreocome Candollei                    |
| Cannas, various, red and green       | Palms, various, as named              |
| Coleus, various                      | Phalaris arundinacea (Gardeners'      |
| Cordyline australis                  | Garters)                              |
| " indivisa                           | Phlebodium aureum                     |
| Cornus alba Spathi                   | Phormium tenax                        |
| Cyperus alternifolius                | " " variegata                         |
| Dactylis glomerata elegantissima     | Phyllostachys mitis and others        |
| " variegata                          | Polygonum lanigerum                   |
| Dasylium Hookeriana                  | Prunus Pissardi                       |
| Eucalyptus citriodora                | Rhus typhina, small                   |
| " globosa                            | Ricinus communis                      |
| Eulalia japonica gracillima          | Ricinus Gibboni, &c.                  |
| " variegata                          | Sansevieria japonica (syn. Dracena    |
| Euonymus japonicus latifolius aureus | elliptica)                            |
| " " albus                            | Solanum Balbisi                       |
| " " radicans variegata               | Solanum pyracantha, &c.               |
| Eurya latifolia variegata            | Zea Mays variegata (variegated Maize) |

Some of the more tender of the foregoing are plunged out for only a little while in the height of summer and early autumn. Those, such as the Privet, the purple Prunus and others, are employed generally as two-year-old plants over very dwarf subjects to relieve the flatness, or they may be massed with other specimen plants. Some other suitable plants could be included, but the foregoing are the more popular at present.

In the succeeding list, as follows, are named those species and varieties which are appreciated for their style of growth, even irrespective of their flowering qualities.

#### PLANTS WITH FOLIAGE AND FLOWERS FOR DITTO.

|   |                                |
|---|--------------------------------|
| Abelia rupestris                          | Lantanas, mixed vars.          |
| Abutilon Golden Fleece                    | Lilium speciosum               |
| Agapanthus umbellatus                     | " Hurrisi                      |
| Alonsoa incisifolia                       | Lobelia fulgens grandifolia    |
| Bougainvillea glabra                      | Manettia bicolor               |
| Bouvardia Humboldtii corymbosa            | Nicotiana macrophylla gigantea |
| Cassia corymbosa                          | " sylvestris                   |
| Celosia plumosa, red and golden vars.     | Nierembergia gracilis          |
| Coreopsis tinctoria, for its gracefulness | Pelargonium citriodorum        |
| Erythrina crista-galli                    | " filicifolia odorata          |
| Francoa ramosa                            | " quercifolium                 |
| Fuchsias, numerous                        | " quinquelobum                 |
| Gaura Lindheimeri                         | " radiatum                     |
| Heliotropiums, various                    | " tomentosum                   |
| Hydrangea hortensis                       | Plumbago capensis              |
| " paniculata grandiflora                  | " alba                         |
| Lantana delicatissima                     | Streptosolen Jamesoni          |
|   | Swainsonia galegifolia vars.   |

These lists comprise most of the larger growing subjects, and though many other plants of similar character could be included with them, yet sub-tropical bedding (an arbitrary title to be sure) as I understand it, demands the use of plants which are not of common quality. In the case of the scented Pelargoniums, the names of some of which are given, the plants are generally specimens measuring 3ft to 4ft in height. The Fuchsias are frequently grown as standards, with umbrella-shaped heads; or they may simply be single-stemmed, with the lateral shoots kept well pinched in. In any case when any such plants are used, it is necessary to have them nearly of one size, and space should be allowed that light and air and rain may have free action on the dwarfier plants which are employed to carpet the bed. It may be further useful to arrange the mixed dwarf plants in the form of a list for ready reference, as follows:—

#### MIXED PLANTS USED IN GENERAL BEDDING.

|                                   |                                    |
|-----------------------------------|------------------------------------|
| Abutilon Savitzi*                 | Leucophyton Browni*                |
| " Thompsoni*                      | Lobelia fulgens                    |
| Alyssum maritima variegata*       | " " grandiflora                    |
| Amaranthus tricolor*              | Lobelias, various, dwarf           |
| Antirrhinum†                      | Marguerites                        |
| Begonia ascotensis                | Mesembryanthemum cordifolium va-   |
| " Corbeille de Feu                | riegatum*                          |
| " fuchsoides                      | Mimulus Harrisoni                  |
| " Laing's Rosy Red                | Panicum variegatum*                |
| " La Fayette                      | Pelargoniums, dwarf Zonal bedders  |
| " semperflorens gigantea          | " " dwarf scented                  |
| " " rosea                         | " " Ivy-leaved                     |
| " tuberosus†                      | " " variegated foliage             |
| " weltoniensis                    | Pentstemon barbatus                |
| Calceolaria amplexicaulis         | Pyrethrum " Parthenium Golden Fea- |
| " mexicana                        | ther*                              |
| " shrubby vars.                   | Salvia patens                      |
| Cannas                            | " " Selarea*                       |
| Celosias                          | " splendens                        |
| Centaurea candidissima*           | Stellaria graminea aureum*         |
| Chenostoma hispidum               | Stöcks, Brompton†                  |
| Cineraria maritima*               | Tradescantia tricolor              |
| Chlorophyton variegatum*          | Vertena Globe d'Or, golden         |
| Coleus, various*                  | " Miss Wilmott, rose pink          |
| Cuphea ignea                      | " " venosa, purple                 |
| " platycentra                     | " mixed                            |
| Dactylis glomerata elegantissima* | Veronica Andersoni variegata       |
| " " variegata                     | Viola Blue Diamond                 |
| Fuchsias                          | " Blue Bell                        |
| Galtonia candicans                | " Bullion                          |
| Gaura Lindheimeri                 | " Canary                           |

(To be continued.)

#### South Africa.

Writing from Johannesburg, a correspondent says: "I am greatly astonished with this country. Vegetables and flowers are grand, and fruit trees do splendidly; only this is winter, the drought may change the effect in summer."

## An Evening with the Microscope.\*

(Continued from page 172.)

We will now say a little about insects, which furnish a vast field of study, whether examined in a living state, the live box, compressor, forceps, disk revolver, or mounted on slides whole or in parts. Many of them are interesting for their extreme beauty, such as the Diamond beetles, of which there are a vast number of varieties. They belong to the family Coleoptera, of which Messrs. Cassell tell us in their "Natural History," 80,000 species of Coleoptera have already been described. A vast number of them are most interesting to the microscopist, either as a whole insect, their wing cases, or parts of their wings. Equally beautiful are the wings and parts of wings of butterflies and moths. Many of their wings appear as though they were scales of a fish displaying most brilliant colours.

As regards the dissecting of insects, such as the tongue of a butterfly, the tongue of a hive bee, the tongue of a drone fly, the stomach of a wasp, the tongue of a spider, the gizzard of a cricket, the cornea of the eye of a moth, and other parts too numerous to mention; it makes one wonder how such minute portions can be extracted from an insect and mounted in a perfect state. We may also add the eggs of insects, particularly from those insects which are quite, or almost, indiscernible to the naked eye, and scores of similar things equally puzzling to the uninitiated microscopist.

We, as gardeners, are too well acquainted with our enemies, the green fly, the red spider, thrip, mealy bug, scale, weevils, woodlice, ants, cockroaches, American blight, and a host of others to require their identification with anything more than the pocket lens or the naked eye; but I have found a microscope of high powers very useful on many occasions. The first in particular, was when I was at Trentham with the late Mr. Stevens. We had a house of young Vines that began to look very sickly, and we were a little puzzled to account for it, as there were no insects on the foliage. The border was also in proper condition for moisture, but on examining the roots under the microscope we found them infested with the dreaded Phylloxera. They were as thick as they could possibly be on the roots, as fat and plump as a lot of aphides. The whole border was carted out and burned; the walls of the house, border and floor thoroughly washed down with hot lime and left open for a few days, when a second application of hot lime was applied, after which the house was brought into use again, and the enemy was found to be thoroughly stamped out. It was supposed to be imported by the purchase of a Vine of a new variety of Grape then being sent out; but the Vine in question was not sacrificed altogether. The wood was not ripe enough for ordinary grafting, so I suggested to Mr. Stevens to bud-graft the half-ripened wood on other Vines, which was done, and every one united satisfactorily. The shoot from each bud produced a bunch of Grapes the following year, but we were no longer troubled with Phylloxera. [This, I believe, was the first time that Vines had been bud-grafted in an unripened state.]

Many cases have since occurred when the use of the microscope has been of special advantage, but I will only mention the most recent one, a case of vermin infesting a Mr. Nash's Ferns. They were so minute that they looked like bits of dust on the fronds. My first impression was that it was fungus; Mr. Nash thought they were insects, and on closer inspection I found the edges and stems of the young fronds had the appearance of being eaten, and were disfigured and crippled; but when putting them under the microscope I found them to be badly infested with *Macrobatus Hufelandi*, a genus of Arachnidæ, described and figured in the "Micrographic Dictionary," also in "Cassell's Natural History." In the latter it is called the bear, or sloth animalcule. This insect enemy was entirely new to me as a garden pest, and it was followed by another one that had infested a lot of *Asplenium viviparum*, the crowns of which had a hardened appearance, and no perfect fronds developed, as they were all crippled and deformed. I cut a portion of the crown of a plant and found it infested with a totally different insect, which was, as far as I could trace it, the *Oribata demersa*, and was there in quantities. It is generally found on *Hyphium inundatum*. Both insects belong to the extensive class of Arachnidæ, which includes scorpions, spiders, mites, and ticks.

(To be concluded.)

\* Paper read by Mr. J. Ollerhead at a meeting of the Wimbledon and District Gardeners' Mutual Improvement Society, February 17th, 1902, the subject being again brought forward on March 17th, after a discussion on Roses in pots.

### Apple, Hawthorn Greening.

I have trees of this variety, a cooking Apple of medium size. I cannot find it named either in Hogg's Manual nor in the list of the Royal Horticultural Society; can you or any of your readers tell me if it is a well established variety or if it should be called by some other name?—A. C.

### Preservation of Hedges.

Gardeners and foresters often experience considerable difficulty in maintaining good hedges under the shade of tall trees. When Thorn hedges are employed for bounding woods and shrubberies, they generally get very gappy after the overhanging branches become so thick as to prevent much rain from falling on the soil beneath. A good deal of mending with stakes and rails then becomes necessary, till at last the patch-work becomes so unsightly that the old hedge is removed and a young one planted. If Whitethorn is used for the purpose, it is almost impossible to get good growth under such unfavourable conditions, and during my recent travels I have noted the generally unsatisfactory state of hedges bordering woods. A few days ago, however, I came across a perfect hedge growing under exactly the same conditions as others near which were of the usual gappy type. For a mile and a half, if not more, I rode beside a dense wood bounded by a hedge of Beech 4ft in height. It was so good that I could find no gap or thinness at any point, it was like a solid impenetrable wall of green. The plants had been set 6in apart. This hint may perhaps be useful to some readers during the planting season. In gardens where an evergreen hedge is required, Box would form a good substitute, as I know of no other evergreen which will succeed so well under trees. Although growth is slow, large bushes transplant so well that it is impossible to grow a good thick hedge at once.—H. D.

### Garden Cities through Co-operation.

Who has not heard of Cadbury's Chocolate? and the Garden City also bids fair to become equally famous as the artisans' model abode, thanks to the inspiration of its founder, Mr. George Cadbury. Large gardens, and a co-operative method of stocking them, are distinctive features of the model village of Bournville, and that the tenants of the Cadbury Trust make good use of the advantages which they have over other dwellers in the suburbs of Birmingham was shown at the recent annual exhibition of plants, flowers, fruit, vegetables, honey, and domestic handicraft, &c., produced on the estate. The remarks made by Mr. Cadbury, who opened the show, seem to me well worthy of being reported in your journal. Mr. Cadbury paid a compliment to the Tenants' Committee, which, he said, was well deserved, not only for the organising of the show, but for many other things for the good of the village. Something like £1,000 a year was contributed to from the village towards the District Council rates, and he suggested that the Village Committee could make an even better use of that money, if they could have it, than the District Council did, inasmuch as they knew exactly the wants of the village. Mr. Cadbury mentioned that at present the committee were testing the system of co-operative buying, by which they could secure plants cheaper, and added that possibly they might shortly be desiring the use of the railway siding to bring their coals on the same principle. Last year five of the inhabitants of the village kept careful account of the vegetable produce of their gardens, and the result was that the five produced on an average—one or two kept poultry—1s. 11½d. each per week. That works out at something like £60 per acre. When the land upon which they were gathered was simply pasturage, it was only producing an average of £4 per acre. Now if the gardens produced fifteen times as much food as the land produced when it was pasture, they were national benefactors, because they were helping to produce a supply of food in England itself, instead of having to go abroad to buy it. Another factor which Mr. Cadbury dwelt upon was the intense pleasure which many of the poorest children of Birmingham derived from coming to the village, and seeing the flower gardens, and some of whom had never before seen that miracle of Nature—the growth of the plant from the seed. He emphasised this side, because there was so little brightness and beauty in the home life of these children, that when they got an opportunity they simply revelled in the beauties of the flowers. A chief feature in the industrial

portion of the show was the large number of loaves of bread, jam tarts, jams, dressed and undressed salads, boiled Potatoes, and table decorations. Prizes were also offered for those who had the best kept forest gardens, generally in each road or lane, the gardens to be judged from January 1 to show day. Such a scheme as this surely deserves success?—W. G.

### A New Variegated Poplar.

I herewith enclose leaves of the new Poplar (*Populus Ontariensis variegata*). This grand variety was raised by Mr. John Carter, Willow Bank Nurseries, Keighley, Yorks, and he holds the entire stock. I had the privilege of inspecting the plants a few days ago, and may say that this new Poplar, with its large, blotched and variegated leaves, stood out with grand effect. The variety has been awarded a Silver Medal at Ghent, and an Award of Merit by the Royal Horticultural Society.—F. R. HAYES.—[The leaves are variegated with yellow. The larger ones measured 7 in in length by 5 in in breadth.—Ed.]

### The Golden Poppy.

As one who grows more of the Golden Poppy than he cares for, let me advise those who covet it to beware of letting it seed too freely. The Welsh Poppy, *Meconopsis cambrica*, as Mr. Woodward says, "does well in gardens, sowing its own seed around it," but, alas! one may have too much of a good thing, and one finds that it may become ubiquitous, and difficult to eradicate. Its roots go deeply into the ground, and even if the top is cut off or pulled away as deeply as possible, the plant has a Dandelion-like capacity for springing again. It is a splendid plant for the wild garden, but beware of introducing it among choice little flowers of the rockwork. The double form is good, and a proportion of the seeds come true to name. Very few people seem to know the orange coloured variety, a garden introduction of recent years. Some day, perhaps, we shall have white and scarlet varieties of what would then be a true perennial rival to the Iceland Poppies. By the way, some do not know that an easy way of distinguishing the *Meconopsis* from the Poppy lies in the long-shaped seed pods of the former as distinguished from the globular ones of the latter.—SCOTICUS.

### Cricket v. Gardening.

Tastes differ and opinions vary, but for my part, Oh! "Never Despair." I would rather have your subtle pen than the best bat that ever Grace—d all England. That demon delivery of alternate patting and punching, on page 175, quite bowled me out, and I stand confessed a sinner—the sin of omitting cricket from my curriculum for young gardeners. What do I think of cricket for young gardeners? Alas! not much, since, as a very young gardener at a home match (too near home), my left-handed batting put the ball through the home window, carrying away several small diamond panes (a pane—ful affair for me), part of the old-fashioned lead casement, and all the savings of a lifetime to pay damages. Then, too, a good hiding that I shouldn't forget. Forget? Forsooth, with the violated money-box staring me in the face. No, I don't think much of cricket, but the fact remains that it has proved to be a tower of strength to "N. D.'s" friend "H.," who is having a good innings through its influence. Truly, a gardener should be a man of many parts. It is unfortunate that it is, too, for gardening in itself is more than able to absorb an ordinary lifetime. Take consolation, "N. D.," that, if you are not an expert cricketer, it may be for years, and it may be for ever ere another is required to fill (?) the post of gardener. Possibly the next gardening plum will be snapped up by a sort of organist-choirmaster-gardener, or other such triple anomaly; and, of course, it is always just possible that a first-class gardener will be wanted, one who is simply that (and enough) and nothing more. That's where my boys come in, God bless 'em. I read my indictment with mingled feelings of pleasure and pain, for thou hast, my dear "N. D.," such a nice way of saying nasty things—nasty because they are true; but, as you will "probably have another turn at those triangles," I conclude that gardening is your first love, as it was mine, and that it will be our last love, too; hence, congratulations, with sincere hopes that you will get a good innings on your merits as a gardener alone. Truly, the head and front of mine offence is not having written to (or for) "the fellow who is out." That may be so—that is not as an Old Boy; but I have thought a lot, and said something to older heads on that head under other noms de plume. If I was a millionaire instead of a much-worried working gardener, it should be my first care to put precept into practice by a strenuous endeavour to mitigate the unmitigated evil. Oh for a golden magnet to draw the iron out of many a poor soul which has entered as deeply into mine as into those of most men; but it is a sore we like to keep "inwards," for all the sympathetic poulticing that draws it out will not remove it, hence, Cui bono?—AN OLD BOY.

### Gathering Tomatoes.

The advice which "W. R. Raillem" criticises on "Gathering Tomatoes," given by me on page 164 is not so wide of the mark as he implies. My advice referred to the outdoor plants which most people naturally wish to make the most of by not allowing the fruits to hang too long. The reasons might have been given, which are, that ripe fruits are subject to cracking if kept hanging when the plants are still being freely watered and fed for the benefit of later fruits. It is quite true that the perfect flavour of Tomatoes is best secured by gathering them direct from the plants when fully ripe. I have often recommended this method of acquiring a taste for Tomatoes to non-lovers of the fruit.—EAST KENT.

### Baths for Bothies.

I am pleased to read of your proposed prizes kindly offered for the best plan of a bothy; it will give our young men a chance who have studied drawing, and so made good use of spare moments. I would like to remind all who contemplate competing that one seldom sees a bath-room provided. I, therefore, earnestly trust all will put such in their plans. Unfortunately, this has been sadly neglected by those responsible at the time when many of our bothies were built, and, as a bath-room takes up so little space, I hope that all who can see their way to do so will add such a desirable compartment. I am sure all young men in a garden ought to be very clean and smart in personal appearance, and they may work better for the addition of a bath-room.—A. J. L., Tyfold Court Gardens, Reading.

### Gardening in the Transvaal.

It appears from a letter published in a Glasgow newspaper, from a gardener recently gone from there to fill an appointment in Johannesburg, that the look out for gardening is not so bad as one would expect, after a period of nearly three years of war in the country. The writer expresses surprise to find gardening establishments very little the worse of the ravages of war, and says that they are in much the same state as in this country. This state of things must be exceedingly gratifying to every one, and more especially to those who have already made up their minds on the question of sooner or later going thence in pursuit of their fortunes. That the home profession can well afford to spare a few is very apparent from the melancholy state of matters elicited by the letter of "Never Despair" in this week's Journal. There is an old saying, and we think it is full of wisdom, "If you have discovered that your existence in the Mother Country is one too many, emigrate; if not, stay at home where you will more likely prove the better citizen." Notwithstanding, we would seriously advise those who find the horticultural bands daily tightening, to make strenuous efforts to reach the paradisaical shores of South Africa. The letter referred to gives graphic accounts of the genial nature of the climate, and inferring from the rapid growth of things, little of the mental troubles, incidental to the home grower, need ever ruffle his happiness or tend to hasten his dissolution. Trees and shrubs planted only ten years, we learn from the writer, now stand from 30ft to 40ft in height. At the time of writing, being midwinter, Acacias of the same height were blooming profusely, as were also Roses, Pelargoniums, Peach trees, and countless other no less interesting plants. The frosts, if any, do not in the least injure them. Fruits of all kinds seem to be abundant; Oranges and Lemons cover the trees, ripen and waste. Vegetables grow well, much better than in Scotland. They comprise the usual class grown in every home garden. They are, however, very dear, for a Cabbage or a Cauliflower realizes from 1s. to 1s. 6d. in the market. This truly must be the heaven of the much-to-be-pitied market gardener. Gardeners there do not use the water pot, all watering being done by a species of irrigation. A water reservoir is placed in a convenient part of the garden, and from which, at pleasure, the water is conveyed in open drains all over the garden. These conduits are stopped where necessary, and the water rises and covers the ground. Food is, however, double what is paid for at home, and most other things are proportionately dear. The coolie makes a very good worker, and the Indian a very excellent cook. In consideration of such an outlet for the damped enthusiasm of the faithful genera who have been sedulously imbibing the mysteries of Euclid's self-evident truths and pons asinorum to boot, truly this is a fertile field for the full employment of all they have acquired to meet the exigencies of the triangular of a circular parterre or the squaring of a Cyclus. A marginless country like the fertile regions of South Africa—ought, we divine, conduce to every active or latent talent being fully and capably exercised. However, we may be tolerated to say this much, in the form of a rider. "Learn, learn ye devils, but dinna' get conceited, for sometimes it interferes with the bread and butter, and that is a bad look out for the wife and weens." The dingling sound of triangles and à sic unchristian,

not to say uncabbage-like learning, often though good enough in a small way, leads to a peculiar form of mental aberration, immensely inimical to the right about attention so necessary in the duly equipped practitioner in the art of gardening. Therefore, as poor simple minded Euclid would say, this requires no demonstration, it is a self evident truth.—KEPOUROS.

### Rose, Dorothy Perkins.

I recently noticed, amid a fine large stand of cut Roses on the stall of Messrs. Perkins and Son, of Coventry, in the Birmingham Market Hall, a bunch of this new American raised variety. It is a seedling from Wichuraiana (not Wichuriana as it is often mis-spelt) crossed with Gabriel Luizet. It has colour of Bridesmaid (a light pink), comes in large clusters, and the growth is that of Crimson Rambler, and sweetly scented. Mr. Perkins remarked that his plants of this new and desirable variety have made remarkably fine growth planted out in his nurseries this year. The flowers, which appear to be very persistent or durable, are produced until late in the autumn. Dorothy Perkins is said to be one of the best of the hybrid Wichuraiana Roses; such for instance as Alberic Barbier, Evergreen Gem, Gardenia, Jersey Beauty, Rene Andre.—G. [We thank our correspondent for directing attention to the name of Wichuraiana (pronounced Wish-ur-i-ana). In England the name is almost invariably spelt Wichuriana, but the Americans render it as Wichuraiana.—ED.]

### Hints for Show Committees.

One of the most important aids to the reporting of exhibits is the ready accessibility of the names of the prizewinners and the schedule classification, and has been variously adopted by the compilers thereof. At the recent Shrewsbury Show, through carelessness or ignorance, many of the class numbers on the entry cards were pasted over by the prize slips. The stamping, also, of the prize numbers disfigures the cards, and often renders the words beneath indistinguishable. Such faults could easily be remedied by allowing a sufficient blank space at the bottom of the entry card to affix the prize slip or stamp, and the necessarily extra depth of the card would hardly be worth consideration. The name of the gardener, also, should be included, with the name of the employer and residence. The non-observance of this frequently applies to the minor shows, the secretaries forgetting that the dual inclusion is of equal interest to the employer, gardener, and the visitor, including assistance to the Press man. Another little matter worthy of attention is the usual practice of the judges, when marking the awards on the back of the cards, using an ordinary blacklead pencil, and I have frequently—so also have the officials whose duty it is to append the numbers of the prizes—experienced an unnecessary difficulty in finding the prize card, owing to the almost undiscernible pencil marking. To obviate this fault, when acting as a judge, I invariably use a large blue garden-label pencil, and was agreeably surprised, when judging at a recent local show, to find the astute secretary fortified with half-a-dozen of such pencils for the use of the judges. This is all the more worthy of mention, considering that he is the secretary of an entirely recently-established show.

In the preface to the report of the Shrewsbury Show in the *Journal of Horticulture* last week it was pertinently remarked that a point worthy of notice was the facility for competitors to find the exact spot whereon to stage their various entries, the printed entry cards being tacked down on the edges of the tables or other staging, thus rendering a commendable service to all concerned. But Shrewsbury generally leads. Another matter, though perhaps a small one comparatively, which is worthy of attention at shows, is the turning of the blank side of the whole of the entry cards downwards upon each exhibit after the adjudication is finished, and not, as too often is the case, leaving them during the exhibition in the position mentioned; and were an official "told off" by the secretary for the purpose indicated, it could be quickly effected. Yet another apparently small item in the arrangement of the various exhibits in their respective classes, is a distinctly defined divisional line, by a broad chalk mark or other suitable material, this being the more necessary where overcrowding of space occurs. For want of attention to this, judges have been known to commit excusable mistakes in judging the entries of another class or section. Lastly, though, doubtless, not exhaustively, the naming of the exhibits, as far as it may be possible, by the exhibitors should be insisted upon, both from an educational point of view and an aid to successful reporting. As an instance of the non-observance of this important matter, I noticed at a recent show about two dozen dishes of Peas, and a host of Potatoes, unnamed. As a remedy for this sort of neglect, probably a few "disqualifications" by the judges would have a potent effect. The non-naming omission is not confined to cottagers and amateurs, who may be comparatively new to exhibiting, but the professional

exhibitor is too often a sinner in this respect, and I have seen—for example—large collections of fruit totally unnamed. The foregoing notices and suggestions may be considered as trifles. Trifles, however, contribute to perfection, and perfection is no trifle. Possibly others may be induced to add to the above items.—BIRMINGHAM.

### Shakespeare and Horticulture.

It is a regrettable fact that the works of Shakespeare and kindred subjects are not more generally studied in the lodge of the young gardener than my experience of both life forces me to conclude. If, after a day's work, a youth can take up a volume of Shakespeare and read and enjoy its classical beauties, I feel sure his time cannot be more profitably employed. The occupants of our bothies should endeavour to gain a taste for high-class literature, and when this is once acquired, its gratification will be found much pleasanter, and certainly more advantageous, than bemoaning any defects which may be found in their temporary homes. It is surprising how a person of studious habits will adapt himself to his surroundings and resign himself to minor discomforts, providing he has access to his books. By this I do not infer that such a one is indifferent to domestic neatness and method; quite the contrary; for, having a naturally refined instinct, he will appreciate refinement in every aspect, yet will

*Cordyline australis* in flower.

(See page 196.)

solace himself by study should he be placed in objectionable environments, while some others will be discontented and irritable.

Year by year the price of good books diminishes, and the days of ignorance are vanishing. Time was when the young man of the working class had perforce to stand in silent awe before the public schoolboy, with his little Latin and less Greek; but now it is frequently possible to meet in comparatively humble walks of life a studious youth who can talk of the Greek heroes, and discuss the alleged difficulties of *pons asinorum* with the best of grammar-school scholars. Even if a youth has no taste for classic lore or Euclid, still it should, at any rate, be his aim to obtain a knowledge of the powers and possibilities of his native tongue, and to attain this end nothing is more helpful than the careful perusal of Shakespeare. That mighty intellect has exalted the English language to a height and majesty far above that of any other nation; he has tempered it in the fiercely hot passions of Othello and Shylock, in the white-hot demon-craft of the bloody Richard of Gloucester, and has moulded it to receive in Desdemona, Juliet, and Miranda some of the most beautiful conceptions of love and virtue that have ever been portrayed.

In this article I propose to notice briefly a few of the allusions of the Bard of Avon to flowers and horticultural matters. It must be pleasing to gardeners and botanists to know that our great national poet—nay, more, the master mind of humanity—has bowed before the charm and beautiful simplicity of the little wayside flower, and has spoken many times of horticultural techni-

calities in a manner which proves his wide knowledge and love of the art.

Different species of Roses are mentioned by the poet more frequently than any other flower. Two are referred to in that well-known speech of Oberon, in the "Midsummer Night's Dream," act ii. scene ii.:

I know a bank whereon the wild Thyme blows,  
Where Oxlips, and the nodding Violet grows,  
Quite over-canopied with luscious Woodbine,  
With sweet Musk Roses, and with Eglantine.  
There sleeps Titania, some time of the night,  
Lull'd in these flowers with dances of delight.

What a picture of sylvan beauty have we here! It is a portrait drawn to perfection; a bower meet indeed for a fairy queen. As we read, we almost fancy we smell the commingled perfumes of the dewy Woodbine and Roses, wafted on the gentle zephyrs of the midsummer night. On two most important historical occasions Shakespeare introduces the Rose finely. In "Richard III.," act iv., scene iii., speaking of the murdered princes in the Tower, Tyrrel says they were:

Girdling one another  
Within their alabaster innocent arms.  
Their lips were four red Roses on a stalk,  
Which in their summer beauty kissed each other.

The other place I refer to is the first part of "Henry VI.," act ii., scene iv. It is the quarrel scene in the Temple Gardens, from which sprang the terrible Wars of the Roses. Richard Plantagenet, Warwick, and Vernon have each plucked a white Rose, while Somerset and Suffolk have taken red ones. Then follows a dialogue of witty sarcasm, raillery, and defiance, the Rose serving the purpose both of sword and shield in the war of words. I quote the following as an example:

Somerset:  
Prick not your fingers as you pluck it off,  
Lest, bleeding, you do paint the white Rose red,  
And fall on my side so, against your will.  
Vernon:  
If I, my Lord, for my opinion bleed,  
Opinion shall be surgeon to my hurt,  
And keep me on the side where still I am.  
\* \* \* \* \*  
Plantagenet:  
Meanwhile, your cheeks do counterfeit our Roses,  
For pale they look with fear, as witnessing  
The truth on our side.

The Violet is mentioned many times, space forbidding more than one example. "Twelfth Night," act i., scene i.:

That strain again; it had a dying fall.  
Oh, it came o'er my ear like the sweet south  
That breathes upon a bank of Violets,  
Stealing and giving odour.

The Lily is often used as an example of whiteness and purity. "Midsummer Night's Dream," act iii., scene i.: "Most radiant Pyramus, most lily-white of hue." "Love's Labour Lost," act v., scene ii.: "Pure as the unsullied Lily." In the "Winter's Tale," Autolycus sings of Daffodils, and in "Cymbeline," Arviragus speaks of the "pale Primrose" and the "azured Harebell."

We will now notice a few of the fruits and vegetables introduced. In "Midsummer Night's Dream," act iii., scene i., the fairy queen says: "Feed him . . . with purple Grapes, green Figs, and Mulberries." The "Merry Wives of Windsor" has: "I will dance and eat Plums at your wedding." Shallow, in second part of "Henry IV.," inviting Sir John Falstaff into his orchard, says: "We will eat a last year's Pippin of my own grafting."

Shakespeare introduces the enemies of the garden with good effect. How admirable is the simile in "Romeo and Juliet," act iv., scene v.:

Death lies on her like an untimely frost  
Upon the sweetest flower of all the field.

Also that in "Henry VIII.," where Wolsey soliloquises on his fall:

This is the state of man; to-day he puts forth  
The tender leaves of hope; to-morrow blossoms,  
And bears his blushing honours thick upon him;  
The third day comes a frost, a killing frost,  
And

And then he falls, as I do, nips his root,

Hamlet, grown weary of life exclaims:

Fie on't! O, fie! 'tis an unweeded garden  
That grows to seed; things rank and gross in nature  
Possess it merely.

In "Richard III.," act iii., scene i., we read: "Idle weeds are fast in growth." Thus examples might be quoted indefinitely. In "Henry V.," act ii., scene iv., Shakespeare speaks directly of "gardeners," and in "Richard II.," act iii., scene iv., a small but characteristic part is written for a gardener.

The young gardener should therefore regard Shakespeare, not as a great genius whose works he dare not attempt to grapple with, but as a man whose thoughts and ideas of beauty, together with an inborn love of the garden, run parallel with his own. Then if a sympathy can be established with Shakespeare's inimitable manner of writing, the student will become more and more engrossed, and thus gain a familiarity with Shakespearean sublimities in their many forms; and familiarity with these cannot but tend to improvement, both morally and intellectually.—JOSEPH E. SIMMS, Astle Gardens, Chelford.

## Societies.

### Shropshire Horticultural, August 20th and 21st.

#### Non-Competitive Exhibits.

Mr. J. H. White, Nurseries, Worcester, arranged an extensive display of hardy flowers and foliage, the exhibit being well displayed.

Mr. A. Meyers, Shrewsbury, had Zonal Pelargoniums, arranged in crescents and in tubes, resembling great bouquets, with Eulalia, Gypsophila, &c., more beautiful in effect than we have ever seen this flower put together before.

From Messrs. W. and J. Brown, of Stamford, Peterborough, Grantham, and Oundle, came grouplets of choice greenhouse and hardy flowers. Heliotrope Lord Roberts is dwarf, and has massive flowerheads; Pelargonium Fire Dragon is now well known, and Alanchoe flammea as well. They had also Carnations, Phloxes, and Roses.

Mr. J. Russell, Richmond, also arranged a group of choice foliage plants, which were rather too crowded, no doubt owing to lack of room. Dracenas, Crotons, Alocasias, Aralias, and similar plants were chiefly employed, making a very bright mass of colouring.

Messrs. Pritchard and Sons, Shrewsbury, presented a novel exhibit of Davallias trained in all sorts of fantastic shapes; also a number of Larches trained as cranes, tortoises, &c. They presented a striking appearance in the groundwork of small Ferns.

Messrs. Smith and Co., Worcester, presented a very large group of plants and cut flowers. The Palms and Bamboos forming the background were attractive, while the masses of cut flowers were effective in their bed of greenery. A good collection of Phloxes and Gladioli were also noticed.

### R.H.S. of Perthshire.

The annual exhibition of fruit, flowers and vegetables, under the auspices of the Royal Horticultural Society of Perthshire, was held in large marquees erected on the North Inch (one of Perth's public parks), on August 21, 22 and 23. This society is one of the oldest, if not the oldest Horticultural Society in Scotland, having been established so long ago as 1805 [and Stirling?], and has during the long period of its existence done a vast amount of good work, and at the same time it has passed through many vicissitudes, sometimes enjoying prosperity, and sometimes not. At the present time it seems to be like the proverbial eagle, renewing its youth and soaring high. With a hard-working, courteous secretary, and an enthusiastic board of directors managing its affairs, a marked improvement has been observable in the annual shows during the past few years.

Despite the unfavourable character of the season experienced in this district, the show this year was of a highly satisfactory nature, the display from an artistic standpoint being perhaps much finer than on any occasion for a number of years back. At the entrance to the first marquee were displayed the bouquets, sprays and wreaths from florists, &c., and these made a magnificent and attractive exhibit. Miss B. C. Kidd, florist, New Seott Street, Perth, carried everything before her, showing a very handsome shower bouquet composed chiefly of Eucharis and White Lilies with long sprays of Asparagus. Her ladies' sprays were greatly admired, special notice being taken of one composed of beautiful Lily of the Valley, of snowy purity. The other prizetakers in this section were Miss Harris, Messrs. Wm. Farquharson, and Wm. Brown all showing beautifully. Taken all over, this was perhaps the strongest exhibit in this class that has been seen for years.

For the best display of cut flowers and foliage, four competitors entered. The judges awarded the premier ticket to Mr. Wm. Lowe, gardener to James Ramsay, Esq., Balhousie Castle; second, Mr. John Leslie, gardener to Mrs. Coates, Pitcullin; Mrs. McKendrick, Burnbank Terrace, securing third. Only one group of plants was set up; this came from Pitcullin, and was bright with highly coloured Crotons and Dracenas, interspersed with Palms, Schizanthus, &c. Table plants, 10ft by 5ft, brought out three competitors; here again Mr. Leslie scored an easy victory. Mr. J. Margaeh, gardener to P. W. Campbell, Esq., Murtonbank, was second, and Mr. Lowe, Balhousie Castle, third. Specimen plants were only very moderately shown, Messrs. Leslie and Margaeh being the principal winners.

In the cut flower department there was a wonderfully bright display, considering the unpropitious season, and in some sections competition was very keen. Sweet Peas were magnificent, those staged by Mr. Kennedy, Moness Gardens, Aberfeldy, which won him the medal, were exceptionally fine. Roses were much finer than they are usually seen at this date. Mr. Harper's stand was first-class, not a faulty bloom being among them. Pelargoniums, wrongly named Geraniums, were a strong class, there being no fewer than eight entries. The first prize was

*Erica mediterranea* at Glasnevin.

(See page 196.)

awarded to Mr. Wm. Little, gardener to Walter Low, Esq., of Ballendrick, Bridge of Earn, with large brightly coloured blooms. Begonias, Pansies, Stocks, Marigolds, &c., were all well shown.

For twelve bunches of annuals, distinct, Mr. J. McFarlane won in a strong class with a capital exhibit. Fruit was also well staged, especially Grapes. Here Mr. Leslie carried all before him, other winners being Messrs. Bain, Little, Margach and Lowe. Apples were poor, owing to the cold season, Mr. McFarlane winning for both dessert and kitchen varieties. Peaches and Nectarines were well shown by Mr. Leslie. Cherries, Gooseberries and Currants were plentifully shown, and of excellent quality.

For a collection of hardy fruit, eight varieties, three competitors staged, Mr. Harper, Tulliebelton, securing first place. Vegetables, as a whole, were not so fine as usual, although there were exceptions, notably the collection of ten varieties set up by Mr. Harper, which would have been hard to beat anywhere, everything being in the pink of perfection and beautifully staged. Unfortunately a railway accident happened the night previous to the show, whereby a special train conveying a quantity of side shows was wrecked. This will very materially affect the drawings at the gate, which is much to be regretted. —ALBYN.

### Aberdeen Horticultural, August 21st, 22nd, 23rd.

The annual three days' show of the Royal Horticultural Society of Aberdeen was opened in Central Park on Thursday last. Experts consider the quality of the exhibits remarkably good when the inclemency of the season is considered. The number of individual entrants was less than last year, but there are more exhibits. In the section for plants in pots open to professionals the honours were carried by Mr. Proctor, gardener to Sir William Henderson; Mr. Gregor, Fairfield Road House, Drumtochty; Mr. Douglas, Kepplestone House; and Mr. Sim, Glenburnie. In cut flowers the leading prizewinners were Mr. Johnstone, Port Elphinstone; Mr. Sim, Glenburnie; and Mr. Douglas, Kepplestone. In fruit A. Hutton, Montrose, and A. Howie, Drumtochty, were the most successful exhibitors; while for vegetables James Grant, gardener to Miss Chalmers, Rothiemoriman, and F. Kinnaird, Broomhill, Aberdeen, were first and second. Messrs. Croll, Dundee, were first for Tea and hybrid Roses, Messrs. Adam and Craigmyle, Aberdeen, being second. Mr. Kilgour, gardener to Mr. Webster, Edgell, was first for the best specimen plant in flower with a magnificent *Disa grandiflora*. Fruit, particularly Strawberries, shown in the working class section, is all over better than that in the amateur section. W. D. Kirton, Ellon, and John Grieve, Woodside, were successful in this department. Amongst the amateurs Messrs. Minty, Aberdeen, and John Miller, Aberdeen, took honours for cut flowers. There were some beautiful hand bouquets, and the medal for table decorations in the amateur section was gained by William Taggart, Waterloo Station, Aberdeen. The Earl of Aberdeen opened the show at noon, there being also on the platform Lady Aberdeen, Sir Allan Mackenzie, Lord and Lady Kilmarnock, and Principal Lang.

### R.H.S., Scientific Committee, August 19th.

Present: Dr. M. T. Masters (in the chair), Messrs. Gordon, Odell, Druery, Hooper, Saunders, Bowles, Worsley, Dr. M. C. Cooke, Revs. W. Wilks and G. Henslow, Hon. Sec.

*Lavender, improved*.—Mr. Wilks showed a spray of a new selected Lavender, having dark purple corollas and calyx. The scent was also stronger than that of the old form. He remarked that the white Lavender was devoid of scent. Mr. Bowles observed that this new kind was somewhat like the dwarf form of Lavender.

*Galls*.—Mr. Odell showed specimens of various galls on the following plants: *Poterium sanguisorba*, galled by *Eriophyes sanguisorbæ*; *Polygonum amphibium*, galled by *Cecidomyia persicariæ*; Oak, *Q. sessiliflora* and *Q. pedunculata*, galled by gallwasp, *Aphilothrix gemmæ*; *Salix fragilis*, galled by *Nematus gallicola*; bud galls on *Campanula glomerata*.

*Abelia rupestris* (?) *phyllotaxis*.—He also showed three stems of this plant having opposite leaves, whorls of threes and whorls of fours on separate shoots.

*Pyrethrum aureum* var. "Staghorn".—Mr. Druery exhibited a plant of this variety raised by Messrs. Storie, Dundee. It is characterised by a distinct tasselling or cresting of the main and lateral apices, precisely as obtained so frequently in Ferns. This form of variation is extremely rare in phanerogams; the only instance known to the exhibitor being the crested form of *Asparagus plumosus*, in which case it is correlated with extremely Fern-like foliage. In the *Pyrethrum* shown the leaves are distinctly pinnate, with stipitate pinnae precisely on Fern-lines, as are the terminal. It is stated to be so far fixed that 80 per cent. of the seedlings are true after five years' cultivation.

*Malformations*.—Mr. Corderoy sent examples of Wheat-ear, *Antirrhinum*, in which no flowers were present, but short branches covered with minute green bracts occupied their position. A Briar which bore a yellow variegated stem, but the leaves upon it were entirely green, an unusual combination for which no reason could be assigned. *Lathyrus latifolius* with green flowers. These apparently had received some check, so that although nearly fully formed, the flowers dropped. The stamens had full-sized anthers, which did not dehisce, the styles were arrested much below the anthers, and the stigmas were immature. As the flowers of Honeysuckle sometimes exhibit a similar appearance late in the season, it may be attributable to the late cold month of July.

*Silver-leaf disease*.—Mr. Worsley exhibited the grafted portion of the stem of a Peach or Plum showing the decayed condition of the centre. He observed that below the graft the dead part decreased by degrees downwards, till in the roots there was none. His impression was that the disease (sterium, according to Prof. Perceval) proceeds upwards and downwards. The specimen was sent to Prof. Perceval for further examination.

*Onions and caterpillars*.—Mr. J. Walker, Thame, sent some foliage, upon which Mr. McLachlan reports as follows:—"The larva is that of some Noctuid moth, and probably of *Mamestra brassicae*, which will feed on nearly everything, from Oak to grass. At the present time hand-picking, where the plants are attacked, would perhaps be best, or a good spraying with some of the paraffin preparations. Earlier in the year—say two months earlier—repeated spraying with arsenical or paraffin preparations might save the young plants. At this season the attacks will probably not do very much harm, as the Onions will be well on towards maturity. One can hardly prevent the depositing of eggs, because the moths fly from a distance; the thing is to preserve the young plants by rendering the foliage distasteful by means of spraying as before mentioned. Even this is uncertain, because the larvæ may move on to the Onions from some other contiguous crop that may have been gathered, such as Cabbage, &c." Some doubts were expressed as to the desirability of using arsenical preparations, in case it might be absorbed by the Onions, when eaten in the early stage.

*Physianthus and moths*.—Mr. Henslow exhibited flowering sprays of this plant from Cape Town, in which nearly every flower had retained a grey moth, by the proboscis having caught between the anthers, which are fixed to the stigmatic head in *Asclepiads*. They either died from starvation, or were picked off by bats, which are aware of their constant presence in these flowers.

*Pelargoniums with secondary tubers*.—In allusion to the illustration lately received of *Leucoium*, with secondary tubers below the first, Mr. Henslow showed specimens of small tuberous-rooted species from barren slopes of Table Mountain, in which similar secondary tubers were found below those from which the foliage and flowers proceeded. He suggested that they might be water-reservoirs in this particular case, as the plants were in full flower in the dry season. Such tubers occur in plants (as species of *Erodium*) in the N. African deserts.

*Phototropism*.—Mr. Henslow described an experiment to illustrate the effect of light in connection with gravity, &c. Mustard seed was grown on a thin layer of cotton wool, kept moist, on a perforated tin tray, suspended under an inverted flower-pot, raised upon a support so that the Mustard was illuminated only from below by means of a sheet of white paper. Gravity had no effect upon the germinating

radicles. If any protruded through the holes they at once turned back, and with all the rest were entwined in the wet wool. Hydro-tropism thus entirely superseded gravity. When the tin was suspended horizontally, the hypocotyls with the green cotyledons curved downwards; those on the circumference, being more strongly illuminated, curving more rapidly than the cluster in the middle. When the tin was suspended vertically, after two or three days all the seedlings curved downwards in the direction of both light and gravity, phototropism overcoming negative geotropism, or apogeotropism. These terms, of course, only describe the movements of the hypocotyls as "towards the light," or in "opposition to gravity," or "away from the earth." They are not "forces." The experiment suggested the possibility of different degrees of illumination being the primary influences in causing the upward growth of the stem and the downward growth of the root. It may be remembered that aerial roots of Ivy protrude on the less illuminated side, irrespective of gravity. So, too, the radicle of Mistletoe grows towards the bough on which the seed is fixed; so that as the direct light from the sky is greater than the reflected light from the soil, the shoot-end of a plant grows upwards and the root-end downwards. Gravity, however, is believed to act upon the root-tip, as Darwin and Dr. Francis Darwin explain, unless it be overcome by the presence of water, manure, &c. The stem, by growing upwards in opposition to gravity, puts out mechanical tissues to support itself under the influence of gravity, which always tends to pull it down, and has acquired a permanent tendency to rise, as shoots laid horizontally will rear their tips perpendicularly if kept in total darkness. Similarly, it is presumably possible that the root-tip has become sensitive to gravity as a secondary effect. As far as the germination of spores can throw light upon primitive conditions, it has been found that the first cell-plate laid down in the unicellular spore of Ferns and Equisetum is approximately in a plane at right angles to incident light, and that the most illumined half lays the foundation of the stem. Again, the dorsiventrality of the prothallium of a Fern, and the development of the rhizoids upon the under side, are determined by different degrees of illumination, and not by gravity.

### Goole, Yorks, August 14th.

A successful show was held by the Goole Agricultural and Horticultural Society on Thursday, August 14. Mr. W. Curtis, gardener to J. Blacker, Esq., Selby, led in class 2 for a group of plants, the second and third awards going respectively to Col. Harrison Broadley, and Messrs. Simpson and Son. The colonel was foremost for a dozen distinct stove or greenhouse specimen plants. Amongst other exhibitors who contested successfully were Messrs. G. H. Shaw, of Howden; R. Creyke, Rawcliffe Hall; and F. B. Grotian, of Hessle. Fruit and vegetables were fair. Mr. Creyke (gardener, Mr. D. T. Millar), contributed the finest sets of vegetables, and also did well in the fruit section. Mr. Shaw, of Howden, won first place for a collection of outdoor fruit, Mr. Creyke being second. Lady Beaumont (gardener, Mr. Nicholls), as usual, figured well in the prize list. The judges were.—Plants and flowers: Mr. G. Wilson, Swanland Manor; Mr. G. Taylor, Byram Hall. Fruits and vegetables: Mr. H. Butcher, Arksey Hall; Mr. A. Brooks, Womersley Park. Some trade exhibits were also on view.

### Trowbridge, August 20th.

The fifty-third consecutive and successful exhibition of this Society was held on the above date, and though the morning was stormy and threatening, fine weather afterwards drew the usual crowd of visitors. Being centrally situated, the high standard of the show is maintained because of easy access, more than because of the liberality or progressive spirit of the executive.

Fuchsias, for which the show is famed, were, if anything, in finer form than last year, and the specimen flowering plants surpassed in some degree previous records; while foliage plants, Ferns, Caladiums, Coleus, Gloxinias, table plants, and Zonal Pelargoniums contributed in their wealth and variety to what was unanimously considered a fine show.

Mr. Matthews, gardener to W. J. Mann, Esq., won in each class of flowering specimens respectively, nine, six and three. *Ixora Pilgrimi*, *Erica Eweriana elegans*, *Clerodendron Balfouri* (very fine), *Allamanda nobilis* and *A. Williamsi* were particularly striking plants. Mr. George Tucker won second prizes with the two first-named, and Mr. Helps, gardener to E. H. Atchley, Esq., with three plants. Mr. George Tucker's Fuchsias were models of good culture, though in the class for six he was followed closely by E. T. Foxcroft, Esq., Hintin Charterhouse. The plants stood from 8ft to 9ft high, beautiful and even in growth, also very fresh. Western Beauty, Brilliant, Final, Charming and Doel's Favourite were some of the best kinds.

Twelve Ferns made a capital display, three competitors demanding a large space. Mr. Tucker maintained the lead which he has held for so many years. Messrs. Stokes, Hilper-ton, were second, and A. P. Stancomb, Esq., third. Foliage plants from the late Sir Roger Brown's garden were on this occasion surpassed by those from Rood Ashton, Colonel Vivian's,

brightly coloured Crotons aiding him in his victory. Messrs. Cole and Son, Bath, being third.

Roses were finely represented by Messrs. Perkins and Son, Coventry, who won with thirty-six varieties, twelve triplets, twenty-four distinct, and twelve blooms. Messrs. Townsend and Son, Worcester, and Messrs. Cooling and Son, Bath, being other successful exhibitors. The latter won with Garden Roses, though run closely by Messrs. Townsend.

Dahlias were, for the season, well represented. Messrs. G. Humphries, Chippenham; J. Cray and Sons, Frome; and T. Carr, Esq., Twerton, were to the front in the several classes. Space does not permit of fuller details, though the many representative classes deserve mention.

As with other shows now past, Fruit was thinner than usual, due to the adverse season. Quality, however, was not wanting in several of the principal classes. For ten dishes, Mr. Strugnell, gardener to Colonel Vivian, was first, and also in that for six varieties, staging fine samples of Sea Eagle Peaches, Humboldt Neectarines, Melons, Figs, Apricots, and Grapes, with Madresfield Court and Muscat of Alexandria. He also won with black Grapes in two classes. Mr. H. Jones, Bath, and Mr. Helps, Rodwell Hall, Trowbridge, following, also with good fruit in collections and Grape classes. Peaches, Neectarines, Apricots, Plums, Melons, and Apples were numerous staged, and all good. Some uncommonly good Jefferson Plums were shown by Mr. Cutter, Frome; and outdoor Green Gages, from E. F. Bousanquet, Esq., Steeple Ashton, were ripe and well coloured.

Vegetables, both open, amateur and cottage grown, were, as is always the case at Trowbridge, extensively displayed, and the quality throughout excellent. Prizes are offered by Messrs. Sutton, Reading; Toogood, Southampton; and Webb, Stourbridge, in addition to that of the society for collections varying in number, each and all bringing out keen rivalry; but the competition for special prizes offered for cottagers afforded the judges the greatest difficulty by their extent and quality.

There were three competitors in decorated dinner tables, a new and very pleasing departure in the society's schedule. In this Messrs. Cole and Son, Bath; and Mrs. Woodland, Frome, won with effective taste the prizes offered. Messrs. Perkins,

Pear, Marguerite Marillat.

Coventry, took first prize for shower presentation bouquets. The Frome Flower and Fruit Co. won with bouquet of Sweet Peas and two buttonhole bouquets. An epergne of fruit and flowers found an easy winner in Messrs. Cole, of Bath, as also did that for a bowl of Roses.

Mr. G. E. Snaihum, with characteristic tact, conducts the secretarial duties of this old-established society, assisted by a strong committee, composed entirely of tradesmen of the town. The addition of a little more garden element in the constitution of the society would add materially to the management on show day, as well as in the schedule.

### Birmingham Gardeners'.

The Birmingham and District Amateur Gardeners' Association held its second annual summer show at Bristol Street Board Schools on Saturday evening, the 16th inst. The exhibits reflected much credit on the members, and justified them in their opinion that, given a fair field, the amateur can more than hold his own. The society was formed ten years ago with a view of encouraging gardening amongst amateurs; to-day there is a membership of over 200. This total bids fair to show a very large increase within the next few months, as the aims of the association appear to be more than ever appreciated. It should be remembered that the exhibition is purely for the amateur, the association's motto being "An Amateur Show for Amateurs." There were ninety exhibits, the Sweet Peas and Carnations being exceptionally fine. The table centres and Table Decorations were also well shown.

An innovation was made this year by inviting local nurserymen to send honorary exhibits. Mr. J. H. White, Worcester, brought down a splendid collection of herbaceous and other cut blooms, for which he was rightly awarded a Silver Gilt Medal. The display contained upwards of 100 bunches, besides a tray of twenty-four Cactus Dahlias. A number of the members also put up exhibits not for competition. Especial mention should be made of some faultless Carnation blooms shown by Mr. W. H. Twist, Yardley; a collection of fruit and Violas, shown by Mr. G. F. Kent, Wylde Green, and a collection of cut blooms, containing some very fine early Chrysanthemums and Stocks, shown by Mr. S. Coney, Monument Road, to each of which a Silver Medal was awarded. Mr. F. Wright, King's Norton, also gained a Certificate for a tray of six Roses.

The show was opened by the president, Mr. Councillor Wm. Davis, J.P., at 5.30 p.m., who congratulated the association upon the magnificent display of blooms. In the course of his remarks he said it was a pity such a beautiful show was held in such un congenial quarters, and was of the opinion there were a number of gentlemen in Birmingham who would be only too pleased to allow the association the use of their grounds for such an occasion. This, he thought, would be infinitely preferable to having a show indoors in the middle of the summer.

The following were amongst the principal prizewinners:—Groups of plants: First, Mr. W. A. Sarsons; Carnations (white grounds and selfs): First, Mr. Herbert Smith; second, Mr. W. H. Twist; third, equal, Messrs. C. W. Clarke and A. L. Wadley. Yellow grounds: First, Mr. W. H. Twist; second, Mr. Herbert Smith; third, Mr. C. W. Clarke. Sweet Peas (four bunches): First, Mr. C. W. Clarke; second, Mr. G. F. Kent; third, Mr. G. Fox-Allin; and for nine bunches do., First, Mr. W. A. Sarsons; second, Mr. A. L. Wadley; third, Mr. J. E. Muston. Annuals: First, equal, Messrs. J. E. Muston and A. L. Wadley.

For an arrangement of cut blooms: First, Mr. G. F. Kent; second, Mr. W. H. Edwards; third, Mr. W. A. Sarsons. Table centre (ladies): First, Mrs. Muston; second, Mrs. T. Powis; third, Mrs. T. L. Griffith. Perennials: First, Mr. Kent; second, Mr. Wadley. Begonias in pots, Mr. Sarsons; Cucumbers, Mr. Fox-Allin; Tomatoes, Mr. G. Sleath; Window Plant, Mr. Kent; Phlox, Mr. Wadley, and Perennials, Mr. Wadley.

### Pear Marguerite Marillat.

This Pear, which is of French origin, was introduced into this country some years ago, and is now sufficiently well known to be regarded as one of the most valuable varieties for September and October use. In appearance this Pear is decidedly handsome. The colour is clear lemon yellow with very numerous pale brown spots of russet and occasional patches of similar colour. The deeply set, medium sized eye has stout incurving segments, and is surrounded by a large patch of light brown russet. The very stout stalk, about  $\frac{3}{4}$  in. long, is set on the side of the fruit, and its fleshy base is encircled with thin russet. The cream coloured flesh is firm, with a faint suspicion of grittiness, and a slightly musky aroma. It is very juicy and rich in flavour. Marguerite Marillat has grown rapidly in public esteem, and its popularity will increase immensely as its undoubted merits become fully recognised. A number of fine specimens were included in the fruit collections last week at Shrewsbury.

### Fruit Forcing.

**PEACHES.—SUCCESSION HOUSES.**—Trees that ripened their crops in July will have the buds plumped and the wood sufficiently ripened for removal of the roof lights by the early part of September. This is sometimes desirable when the buds become too prominent, and tends to counteract the tendency to over-maturity of the buds or their premature development, alias falling, by affording the trees the benefit of rains and of night dews, the border becoming thoroughly soaked right through to the drainage by the autumn rains, which invariably has an invigorating effect on the trees, and in the preservation of the buds from dropping. It does not answer, however, to remove the roof lights until the wood is well ripened, but over-maturity of the buds is a greater evil than a moderate degree of prominence.

**TREES THAT RIPENED THEIR FRUIT** this month should, as soon as the fruit is cleared, have the wood that has carried fruit, not being extensions, cut away, and any wood not required for next year's bearing or for the extension of the trees also removed. Weakly and exhausted parts ought, as far as possible, to be cut out and the younger growths given advantage of their place. This will keep up a succession of bearing wood capable of producing large fruits, admit of the freer access of light and air, and of the cleansing of the foliage by water, or an insecticide if necessary, it being important that the foliage be continued in a healthy state to as late a period as possible, for the perfecting of the buds and the maturity of the wood. Air should be admitted to the fullest possible extent. If, however, the trees are not ripening their growths well, keep the house rather close by day, and throw it open at night, which will check the tendency to late growths, and ensure maturity of both wood and buds. There must not be any lack of moisture at the roots, giving a good watering if necessary, or trees that are weakly will be assisted in plumping the buds and storing nutrient matter with liquid manure, not, however, in too powerful doses.

**TREES RIPENING THEIR FRUIT** will need water at the roots, and moisture must not be withheld from the atmosphere; an occasional damping of the floor or border, especially on fine days, being necessary for the maintenance of the foliage in health. If the weather be cold and wet a genial warmth in the hot-water pipes, especially by day, so as to admit of a circulation of air, will be necessary for the satisfactory ripening of the fruit. A temperature of 60deg to 65deg at night, and 70deg to 75deg by day will be sufficient in order to keep the fruit in a steady progress of ripening, air being afforded more or less constantly. If the fruit ripens too rapidly, as may be the case if the weather proves very bright, a shading over the roof lights of a single thickness of pilchard net, or a double one of herring net, will break the fierce rays of the sun, and not only retard the ripening, but ensure the fruit finishing more satisfactorily than when exposed to the direct rays of the sun.

—ST. ALBANS.

### The Kitchen Garden.

**SPINACH.**—Autumn sown Spinach, when it stands well through the winter, provides an early crop of fine and succulent leaves earlier in spring than it can be obtained from a spring sowing. Also in the autumn some pickings are possible, but this is a matter of minor importance, as it is only desirable to reduce the plants so that they do not touch or unduly crowd one another. Select an open piece of ground, fairly rich and moderately firm. Draw drills 1 in deep and 12 in apart. This distance between the rows affords ample room for hoeing and cultivating, so as to promote vigorous growth in spring. The winter, or prickly variety of Spinach is very hardy and usually considered the best to sow at this season, though some prefer the round, or summer variety. It is a fact that Victoria Improved Round is suitable for either spring or autumn sowing, being quite as hardy as the prickly, and will come into use in advance of the latter. It produces dark green, broad thick leaves, therefore this texture renders them less liable to injury during the many and frequent changes in temperature. It is well to include both varieties, because if one is better than the other, a convenient succession is secured. The present sowing may be considered a main sowing, but several others should follow, as it is not certain which will prove the most serviceable for a forward spring crop.

**CABBAGE AND COLEWORTS.**—If seedling plants recently pricked out have strengthened sufficiently to lift with tufts

of fibrous roots with or without soil attached, the final planting may be carried out. The rows should be 2ft apart, and the plants can, if plentiful, be placed 1ft apart, with the intention of taking out every other in spring for planting elsewhere or cutting early. Rosette Coleworts come in useful also for planting as a supplementary crop, that is, instead of utilising the whole of the space with Cabbage, employ Coleworts, one of the latter between two of the former, all being 1ft apart.

**SOWING LETTUCE.**—A last sowing of Lettuce should be made, selecting a dry, sheltered border having well drained soil. Draw drills 1ft apart,  $\frac{3}{4}$ in deep, and sow thinly so as to encourage sturdy plants from the first. Of the Cabbage varieties Hammersmith, Hardy Green, and All the Year Round are good; while of the Cos Lettuces, Hicks' Hardy White Cos, and Bath or Brown Cos, are excellent.

**PLANTING LETTUCE.**—A good breadth of strong seedlings from an earlier sowing ought now to be planted out. On damp and heavy ground they are certain to succumb, therefore select a light and well drained position, inserting them in rows about 15in apart, the plants 4in to 6in asunder.

**ONIONS.**—Should the summer crop of Onions not yet be harvested, it is advisable that the first opportunity be seized to pull them up. In dry, settled weather they might remain on the ground, or preferably be placed on mats until the outer skins are thoroughly dry. Failing weather of the proper character, convey them under cover and allow them to finish with the assistance of plenty of air. Arranged thinly in boxes or on mats it will be possible to give them the benefit of sunshine by placing them outside on fine days.

**POTATOES.**—Embrace every available opportunity of lifting Potatoes, sorting, drying, and storing them. A bulky crop of tubers may be stored in clamps in a sheltered, well drained corner. As far as possible discard all diseased tubers, as sooner or later they will contaminate the rest. Some good new varieties were shown by Messrs. Dobbie at Shrewsbury.

**CELERY.**—The early crops will now be in demand for use. If the soil is carefully removed down to the roots on one side, lifting is rendered easier. Continue the earthing up finally of successional rows. Dry weather, when the soil works crumbly, is the best period. Successional or late plants still in growth may be helped with liquid manure. Chop down a little soil on each side the rows as a preliminary earthing.—EAST KENT.

### Meteorological Observations at Chiswick.

Dull cloudy weather has prevailed during the past week. Rain fell on six days, the greatest quantity falling on the 18th.

### Hardy Plants at Kew.

In the rockery, the Royal Garden, Kew, we notice a new Forget-me-not, *Myosotis azorica*. It grows half a foot high, is close, erect, and rather sturdy. The leaves are hispid and like those of the Mouse-eared *Stellaria*. The flowers, which are large, are deep violet-purple in colour. It was received from Messrs. Barr in February of this year. *Anemone japonica* Lady Gilmour, with its large and heavily crested foliage, furnishes another handsome subject in the rockery. *Dianthus laburnicus* Knappi, with very bright primrose flowers the size of a sixpence, is interesting. The segments are finely serrated. It grows 1ft in height, and is half erect.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy—Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**BOOK WANTED** (A. W. B., Northumberland).—The handbook, "Garden and Grounds, How to Lay-out and Arrange," has been sent to you.

**TRICYRTIS HIRTA WITH BROWN SPOTS ON LEAF** (S. N.).—The spots are caused by the *Sclerotinia* that infests *Lilium*, especially *L. candidum*. The ascigerous condition of the fungus is not yet known. It is certain, however, that the sclerotia are formed in the diseased tissues, hence the removal and burning of these is a good means of prevention. Probably spraying with a solution of sulphide of potassium, 1oz to 3gals of water, first dissolving the sulphide in a quart of hot water, and then making up to 3gals with cold water, would arrest the disease, and if resorted to sufficiently early prevent it.

**PREPARING GROUND FOR GARDEN** (Bucks).—The land being at present overgrown by Bracken and small Brambles, it would be advisable to stub up these now or as soon as convenient by means of a mattock or drag hoe, grubbing up the Brambles and pulling the rootstocks and roots clean out of the ground, as every portion of large root left would probably push growth, and the rhizomes of the Brackens should also be cleanly removed from the soil, taking advantage of the opportunity to extract all tap-rooted weeds, such as Docks, Dandelions and Plantains, with any creeping or stoloniferous grasses, throwing the whole on the surface to dry, and when sufficiently dried and freed as much as possible from soil by knocking about, collect into small heaps and burn the whole thoroughly, not leaving any matter unconsumed. Afterwards scatter the ashes evenly over the ground, and then bastard trench it, breaking up the spit of soil below with a fork, or if necessary a pick, but do not bring it to the surface. A trench should be taken out 2ft wide and 1ft deep, first paring off the surface an inch or two in depth, and placing these separately at the other end of the ground. Break up the bottom of the excavation, and if the soil be of a poor or stubborn nature, add some half-rotten manure, say a dressing 2in or 3in thick, and mix with the soil in breaking up. Next pare off the next breadth marked off by line 2ft wide, and place it on the broken up soil in the trench, and on it the soil a spit deep, breaking up the bottom of this trench, and so proceed to the other end, filling the last trench with the material taken from the first. The sooner this is done the better, and when completed the ground may be top-dressed with a mixture of 32 parts basic cinder phosphate and 12 parts kainit, mixing well and applying 14lb of the mixture per rod. As the surface will be rather rough, leave the dressing until February, or as soon after as the ground is in good working order, then fork over, taking small spits so as to mix or break up the soil, a coating of well rotted manure having been placed on the ground during frosty weather, at the rate of 2½cwt. per rod. In the course of a short time the ground will be fit for planting or sowing. By placing the surface a spit deep it will not interfere with cultural operations, and by breaking up the bottom the staple will be considerably bettered. A dressing of nitrate of soda, 1½lb per rod, at time of sowing or setting crops would be an advantage, but it must not come into direct contact with seed or roots.

**GARDENING APPOINTMENT IN THE UNITED STATES** (Artus).—Really good gardeners, and especially those who are able to do two days' work in the space of one, will doubtless succeed in the United States. Reports as to the chances and opportunities there, vary. One says "Come, there are situations and high wages for all." Another will tell you that there are plenty of gardeners only getting the equal to £1 per week. Certainly the demand for private gardeners, and especially landscape gardeners and all connected with their work, is growing in America, according to report; and this must necessarily be so, as the country becomes older and country estates come into being. The country is in its infancy in that respect. You could write to Meehan and Sons, of Germanstown, Philadelphia, who would possibly supply the proper advice. Why not consider British colonies first?

**CUTTING BACK STEPHANOTIS (J. L.).**—The plant trained over the roof of the stove with long naked wood several yards and lengths should be cut back by degrees, shortening the longest to the next successional growth below and so on towards the lower part of the plant, which will have the tendency to cause some of the latent buds to start even in the bare wood, and by continuing this procedure from year to year the plant may be kept furnished with young flowering growths from the base upward. This is simply a matter of judicious shortening and thinning so as to keep up a succession of flowering wood without a break in the supply. If cut in close there is a certainty of loss of bloom, and probably not starting exactly where desired, though we have cut hard back and secured growth from old wood, there usually being some eyes remaining dormant.

**SMALL AUTUMN AND SPRING ONIONS (G. N.).**—The Onions are quite sound in both cases, and there is no trace of disease, though the roots appear as you say, to be eaten away, yet no evidence of this having been done by wireworm or other root pest. It is likely there is something amiss with the soil. A dressing of well rotted farmyard manure, however, ought to give better results. If you can command wood ashes apply  $\frac{1}{2}$  bushel per rod, and dig in lightly in the autumn. Give a light dressing of very short thoroughly rotted manure in early spring, say  $1\frac{1}{4}$  cwt. per rod, and  $3\frac{1}{2}$  lb of a mixture in equal parts of basic cinder phosphate and superphosphate of lime, and point in lightly, it being important that the Onions have firm ground, sowing in due course. When the young plants begin to grow, give them a top-dressing of nitrate of soda, finely crushed, at the rate of  $\frac{3}{4}$  lb per rod, and continue these applications of the nitrate about every three weeks until the crop is about half grown. In the case of autumn sown Onions the nitrate should not be applied until spring. Failing the wood ashes, apply  $3\frac{1}{2}$  lb basic cinder phosphate and  $1\frac{1}{2}$  lb kainit per rod in the autumn and dig in, and before sowing the seed in spring, broadcast  $1\frac{1}{2}$  lb per rod of superphosphate, and  $\frac{3}{4}$  lb per rod nitrate of soda.

**MUSCAT GRAPES DISCOLOURED IN SKIN (W. H.).**—The berries are what is known as rusted. This affection of the cuticle or skin is usually caused whilst the skin is young and tender, about thinning time, and disfigures them even when ripe. Handling the berries or brushing them with the hair will cause rust, but the chief cause of rust is cold currents of air, especially when it occurs in the early stages of swelling. The discolouration of the skin of your berries, however, appears to have occurred at a later period, and may have been caused by fumes of sulphur, sometimes had recourse to for destroying red spider, the sulphur being applied to hot-water pipes. We have also known fumigation with tobacco paper to cause rust in Muscat Grapes, and this probably from the article containing a small quantity of sulphur or other substance in fumes acting prejudicially on the skin of the berries. Vapourisation with nicotine compound also injures the cuticle of Muscat Grapes, as well as damages the foliage. We have known Muscats practically ruined by the use of solutions for the destruction of red spider. We mention these as there has been some injury to the skin: at least, we do not find any trace of disease, and we may further say we have known such injury to arise from the use of stable manure, not properly sweetened, as mulching, and even from ammonia vapour given off by guano and other fertilisers, and from strong liquid manure, the house being kept close.

**NAMES OF FRUIT.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. H. C.).—1, Nectarine Oldenburg; 2, Lord Napier.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (C. G. T., Kent).—White flower, Galtonia candicans; yellow one, Melilotus suaveolens; the other is an Iris, but please send when in flower. (T. J. R.).—Conifers received, will be named next week. (N. T.).—1, Veronica Traversi; 2, Cimicifuga racemosa; 3, Limnathes Douglasi; 4, Clerodendron splendens; 5, Begonia incarnata. (F. K.).—1, the Reed-Mace, Typha latifolia; the true Bull-rush is Scirpus lacustris. (M. T., Hamilton).—1, Polygonum Bistorta; 2, Gentiana sp.; 3, Polemonium caeruleum.

## The Wheat Market.

The benefit to the farmer from the recent rise in Wheat is likely to be shortlived, for reports from Continental countries show that during the next twelve months they will be nearly, if not quite, self-supporting, and the United Kingdom being the only available market for the surplus from America and Australia, there is little prospect of present prices being supported. It is not at all unlikely that we shall have Wheat at 25s. here as soon as harvest is over, and it will be interesting to see how far the millers and bakers may succeed in keeping up the price of the loaf. This has been kept up well after being artificially raised at the introduction of the registration duty, and we may be allowed to hope that the consumer may get his own back when the rebound comes. Agriculture is in pressing need of all the money the consumer can afford to pay, but too much toll is exacted by those who do the transfer.

Of the countries of Europe, Italy and Spain are the only two with comparatively poor crops of Wheat. The fine crops of the Continent, unlike our own, are in many cases already harvested, so there is little chance of much demand from these, except at very low prices. England will therefore once more become the dumping ground for the world, and farmers will act wisely in threshing and realising their Wheat at the earliest opportunity. Prices are sure to fall, but there is one consolation to the British farmer: "the foreigner will have to pay 13½d. per quarter for the privilege of competing with him."

That harvest will be much later than has been generally expected is now certain. Agricultural reports were published as late as August 11 forecasting a commencement as early as the 20th or 25th in certain districts, where we can guarantee there will be no reaping before September 4 at the earliest. That this may help to steady prices during the next month is probable, but it will afterwards tend to concentrate autumn thrashings into a small space of time, and intensify the inevitable glut. It may appear wearisome reiteration, but the fact that the earliest thrasher always meets with the best market is especially worth repeating this year.

## Potato Disease and the Crop.

There are dire rumours abroad as to the condition of the Potato crop, and if we had not grown accustomed to the annual cry of "wolf" so persistently raised by growers we might have been seriously alarmed for the safety of the national supply. The sight of the strawsoniser working in mid-August amongst a very fine looking crop shows that there is alarm in the mind of at least one farmer. An examination of the haulm revealed no signs of disease, and though the farmers' practice to prevent in order to save curing may be sound financially, we fancy that there is a good deal more fright than injury. There has been much difference of opinion amongst this man's neighbours as to whether the sprayer had been used to prevent disease or to knock down the haulm, and so let light and air act on the soil. The appearance of the crop immediately after the operation was somewhat appalling, but now, a week later, there is no sign of damage, and, on the contrary, both leaf and stem look as healthy as possible. A portion of the field is left unsprayed, and we shall watch with great interest for any difference that may develop.

We have so far seen no sign of the ordinary Potato disease, but have had our attention drawn to dying or dead patches in certain fields, and in others to the numerous backward and feebly looking roots which are evenly distributed throughout the crop. The patches we should attribute to wireworm, which is generally very local in its attacks. The haulm is in many cases almost detached from the root, and it shrivels up and dies away. At these roots there may be one fair-sized tuber and the rest small rubbish. The weak growth and delicate appearance of many individual roots spread throughout a crop is probably due to one of two causes, both affecting the seed before planting; firstly immature ripening, secondly a severe chill in the storage pit.

There was certainly frost severe enough last spring to injure, or, rather, weaken, tubers which were afterwards used for seed; but last year's crop was so full of second growth which had not properly matured at lifting time, and was quite unfit for seed purposes, that we think herein lies the solution of the problem. When all the tubers of a certain size are retained for seed, without any regard for their ripeness, a very large proportion of them may be quite unfit for the purpose, and we are certain this was so in many instances last spring.

We do not suggest for a moment that there is no disease prevalent anywhere, for the weather just now is most favourable for its spread; but we wish to point out that failures from poor seed or grubs may have but a very small influence for evil on the general crop, and one almost immaterial when compared to the terrible ravages of fungoid diseases. Ill news spreads as rapidly as Potato disease, and we fancy that the dire reports now in circulation have made much greater progress than the attacks they announce. If there is real disease there will soon be ample evidence of it. A bad attack has never been isolated yet.

The new kinds are all looking satisfactory as regards outside appearance. Empress Queen and Royal Kidney are reported to promise well at the root, but Charles Fidler, though a heavy crop, perhaps the heaviest, shows signs of coarseness already. Up to Dates from newly imported seed (Scotch) will hold their own well, we think. They held the markets so well last season that there must be a great demand for them as soon as they are ripe.

## Work on the Home Farm.

The long delay in the ripening of the corn is becoming more and more inconvenient to the methodical farmer. A succession of fairly rapid August harvests has made it difficult for him to accommodate himself to a September one. The efforts will now be chiefly directed towards clearing off every possible arrear of work, not only leaving nothing over until autumn, but doing a few things which are usually not done until then.

We are busy manuring land which will be ploughed for Potatoes in November. There would be no time to manure them after harvest. They are now stocked with breeding ewes, and will be, for it would be unwise to put lambs on them after the manuring.

The coals have been led here, but a farmer's waggon laden with black diamonds is no uncommon sight on the roads. Coals have kept their price well. We are still 2s. higher than before the war, and yet trade is supposed to be very bad. Another good reason for farmers to combine.

There has been plenty of hedge trimming to occupy the skilled hands. It is work which may be very suitably done now. The hedges have got their full growth, and look more ragged than usual after such a growing season. If we get all the low hedges neatly trimmed now we shall be able to present a good appearance when the shooting parties assemble after the stubbles are cleared. We fear partridges have suffered from the cold season, and sport will not be so good as usual. There are many barren birds about.

A practical farmer in the next parish declares that he will mow all his grain with the scythe if he can get the men to do it. This endorses our views, which were expressed last week. Binders may be used of sheer necessity, but may prove very costly unless we are to have a September summer.

Lambs are still doing well, and there is a plethora of keeping, but stock markets are full, and sheep lower in price, 4s. per head the butchers say. Farmers must have money for current expenses, so they are selling sheep which they will have to repurchase later on. We see by the papers that a Lincolnshire farmer has lost fifty sheep after twice dipping at a short interval. The nature of the dip is not stated. Can there have been mercury in it?

# Barr's GOLD MEDAL Bulbs

**FINEST SELECTED QUALITY**

## BARRS' GOLD MEDAL DAFFODILS

Have received Twelve Highest Awards, 1902, including **TWO GOLD MEDALS**

### Rural Pursuits.

**A**ND the Lord God planted a garden eastward in Eden, and there He put the man whom He had formed. The above passage from Holy Writ carries our minds backward for almost 6000 years to the first record of a garden—a garden in which the inmates had no need to toil in order to reap an abundant harvest. Then came the Fall; and henceforth it was decreed that "thorns and thistles should spring up," and that man should "eat bread by the sweat of his brow." In those far-away days, which may be termed the "babyhood" of the earth, rural pursuits formed for a time the only occupation of the sons of men; and it would be difficult to conceive more congenial employment when individual wants were few, and competition scarcely in existence.

After a time cities sprang up, and division of labour must to some extent have been practised; and from that time till now there seems to have been a gradually increasing tendency for the population to build and live in towns, rather than to distribute themselves more evenly over the surface of the earth. Science and art, as applied to manufactures, claimed more and more attention as time passed on, until at length, among highly civilised communities, the ancient arts of gardening and farming, if not neglected entirely, seem to have progressed much more slowly than occupations of infinitely more recent origin. That there is room for vast improvements in our methods of conducting many rural pursuits cannot, I think, be denied; and now that the "emptiness" of city life seems to become so apparent to town dwellers in the second and third generation, "the awakening," which has already begun, may become so strong a

**READERS** are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

force as to break down all barriers which for a time prevent the needed reform.

#### The Awakening.

At the present this fact stands out clearly, viz., that with all the excitement begotten of the race for wealth, city life has a great void, for it does not satisfy the gardening instinct implanted to some extent in every human breast. That this instinct exists is clearly shown on all sides, and under most adverse conditions. Sometimes in the slums of a great city it takes the form of growing a few p'ants on the window-sill or roof of a house; at others by the keen delight taken in the parks and open spaces attached to so many large towns, and although the latter attempt to bring the country into the towns is deserving of all praise, yet it only partially satisfies the craving for country life, and leads millions to yearn for the health-giving power of an outdoor life.

In the past our rulers have neglected to give due encouragement or support to those engaged in rural pursuits; but the need has at last become so apparent that it cannot longer go unheeded. Those engaged in rural pursuits lead the most natural—I might almost say the *only* natural life—and unless there is a constant exchange of population between country and town, town and country, the stamina of the nation becomes undermined, and the decay of the race assured. Under existing conditions, thickly populated country districts are urgently needed from which to draw supplies of vigorous manhood to replace the weaklings of the great towns; and the latter, if suitable employment could be found for them, would have a quickening influence on village life, and their descendants perhaps show alertness as well as increased vitality. The Garden City movement, if it can be brought into anything like general use by large employers of labour, must also prove a wonderful power for good on both the physical health and moral condition of the workers, for though the days may be spent in the factory, the healthy condition of home life, and the evening hours spent in the gardens, will be a vast improvement upon the conditions which prevail generally to-day.

The awakening! How has it been brought about? It has been dawning upon the nation for a long time, but the climax was reached through the perils of war, when the stamina and hardness of country and colonial troops proved the great tower of strength in the time of need, and when mere book-learning and theoretical knowledge and tacticity were of little avail against a foe trained by daily observation to be full of ready resource. The recent movement in connection with the teaching of Nature Study is evidently a step in the right direction, because its fundamental principle is that it fosters in the young a keen spirit of observation; step by step they are led on to see cause and effect from actual work and experiment. This must be infinitely better than cramming the young brain with theories or facts supposed to have been proved by others, and by interesting the young in the real living things of Nature a far greater keenness must be engendered in country pursuits than can be imparted by the reading of books alone. To my mind, however, something more is needed in the later stages of instruction, viz., a greater amount of real practical work, in which not only knowledge but *dexterity* is fully put to the test.

In regard to horticultural pursuits, it is not the amount of knowledge which any individual possesses which regulates that individual's usefulness or probable success, but the way in which the knowledge gained will be turned to the best account, and it is undoubtedly true that the man brimming over with knowledge often accomplishes practically nothing compared with the results achieved by the active individual, who runs what he *does* know for all it is worth. We want a few men brimming over with knowledge, but we want hosts of active workers who will achieve much by strenuous endeavour.

I maintain that a strong feature in the training of gardeners in the past has been the encouragement given to close observation and the practice of judging the rising young hand by the results accomplished rather than by knowledge which was comparatively barren of results. This explains why the best private gardens in the country have in the past been the best training schools for real gardeners, and although modern institutions offer some advantages, a long

course in a good private garden is yet necessary to the making of the highest type of gardener. Rural pursuits have undoubtedly started on the upward plane, and when greater facilities are given for acquiring land, the wasted soil of Britain will again yield bountiful crops, and the grinding life which tens of thousands lead to-day be brought into greater harmony with the ideals which prevailed in that garden "eastward in Eden."—H. D.

### Mutations of Seasons.

The untoward nature of the weather this season, particularly in the northern part of the British Isles, may well occasion the resuscitation of the not uninteresting question, the deterioration of the climate of our island. From time to time the subject has aroused the attention of horticulturists, and though perhaps much light has not been shed upon it, yet much useful information is evolved in the inquiry. To many of your readers the research of the late worthy Curator of Edinburgh Botanic Gardens, Mr. MacNab, will still be fresh in their memories. There is reason to think that the subject would occupy the attention of man at a very early stage of his life history. Many things lead up to such a supposition.

One very pertinent fact is the outstanding characteristic attaching to the human mind with respect to the comparative values it assigns to the present and the past. It may well be said in this connection that we live in the past and only breathe in the present. At all events, few are unaware of the fact that the "good old days" are considered to have been always superior to the present, or the period succeeding them, and, what is still stranger, we somehow fall into the mistake of also assenting. It is needless to expatiate on this interesting quality of the mind, for all know "distance lends enchantment to the view." There is no doubt whatever, however beautifully it pictures the blue mountain peaks of the past, that as far as climatology is concerned, the memory is untrustworthy. From what we personally know of the past history of our planet, though there have been interruptions, we see nothing but that which has the impress of the stamp of progress upwards and onwards. And we have no doubt that instead of a gradual deterioration of climate a gradual amelioration is taking place since at least the period when man made his appearance on the earth.

A Celtic saying exists whose origin probably rests in the mists of antiquity, which predicts annihilation to the greater half of the British Isles by incessant rain. Though we place but little faith in traditionary lore, yet in this we cannot avoid thinking that the fact which gave birth to the expression is very significant as denoting then much worse conditions than now exist. Without traversing beyond the Seventeenth Century ample is there recorded to show that nothing approaching the serious nature of the weather conditions the whole century, more or less, contained has been since experienced. Perhaps the climax of this peculiarly unfortunate century was reached in the period elapsing between 1694 and 1701. For seven years, in Scotland at least, matters were so very serious that the earth absolutely refused to mature food for man or beast. Nothing but blank dismay met the hopes of the disconsolate people year after year, while famine and pestilence were the presiding monarchs of the land.

Again, in the fifties, a not less phenomenal state of matters held sway, and although it did not contribute so fatally to dearth and pestilence, yet it was serious enough to interfere with the order and regulation of food supplies. One year was a year of plenty, in some instances second crops of certain vegetables being exposed for sale in Edinburgh well into the months of winter. Such was the abnormal length of the summer that fruit trees blossomed a second time. Then the following year was, as would be expected, one full of disappointments. This was, however, one of those interruptions which we find everywhere in Nature, evidently a necessity in the grand scheme of progress, and though we poor mortals cannot assign a cause for them, we can easily see that she is relieved after her travail and smiles upon us with a still more benign countenance than before.—D. C.

**Dendrobium × Leechianum.**

A distinct and very beautiful hybrid from the same parents as *D. × Ainsworthii*, namely, *nobile* and *aureum*, and is generally considered a better grower than *Ainsworthii*. In a short time healthy little bits make fine plants if well treated. They are best raised from flowering stems, and if these are taken off directly the blossoms are past and laid in pans of moss, they will be nice stock, ready for potting separately by the end of the season. The flowers of a good form of *Leechianum* (see illustration) are 4 in across, the sepals white, tipped with purple, and feathered; a crimson blotch appearing on the lip. Messrs. Veitch and Low and Co. possess this hybrid.

**The Week's Cultural Notes.**

Bright days and cold nights are what may be expected during September, and a watch must be kept on the temperatures. The plants are growing very freely now, and a check in any department owing to a low night temperature must be avoided. When the fires have been discontinued during the summer months they must be again lit up, taking the opportunity first of thoroughly cleaning the firebars, flues, and every part of the apparatus, attending to any leaks that may be in the pipes, and putting everything in order for the winter. This will ensure a satisfactory working when most needed.

It is unsafe to leave tender plants out of doors without the protection of a frame after this, and if any such as *Dendrobium*, Mexican *Laelias* and others are still in the open the precaution of covering with mats nightly must be taken at least by the middle of the month, as frosts are by then to be expected. If these plants, and *Thunias*, *Bletias*, and others can have the convenience of a sunny and fairly dry greenhouse or vinery now, they are safer here than anywhere. The *Thunias* will by now have lost most of their roots and leaves, but if any activity is shown a little water must still be given or the stem will be weakened for next season.

Not many growers are really successful with *Disa grandiflora*, but the hybrid between it and *D. racemosa*, viz., *D. Veitchii*, is more amenable to culture. Just now the flowering stems are dying off, and a frequent mistake is made by drying them at the roots. Less water is needed, of course, than when the growth was in full swing, but *Disa Veitchii* should never be really dry. In a few weeks time new growths of many of the *Disas* will show, and this is the best time to give fresh compost. Good peat and moss with a little loam and finely broken crocks will grow them well, and a cool airy house or frame is best for them.

Deciduous *Calanthes* are taking full supplies of water now, and require abundant room, so that both foliage and pseudo-bulb have room to develop properly. As soon as the latter have attained to their full size, it will be found necessary to slightly diminish the water supply, and as the foliage turns colour, preparatory to falling, a still further reduction must be made. I have always found that the colours of the blossoms are improved by withholding the water from the time the colour shows. The roots by this time have lost most of their power, and no good can accrue from pouring water on the compost.—H. R. R.

**The Homes of Orchids.**

"One feature of tropical vegetation which differs greatly from that of temperate climes," says Mr. L. Castle in his interesting little book on Orchids, "is the large numbers of species found in a comparatively small area. In Europe, for example, we have large forests of one or two species of trees, and thousands of acres of open moorland similarly clothed with a few species of dwarf plants, like the common Ling; but in the tropics every few square yards is a small botanic garden. This is shown by the fact that a dozen different species of Orchids have been found growing upon one tree, and it is estimated that over 300 species have been introduced from Java alone. In the dry season, from April till October, the average temperature is about 86deg, while in the wet season, from November till March, it ranges from 83deg to 90deg. Upon the Indian continent, in Burmah, and contiguous countries, where Orchids are also found in considerable numbers, the seasons are similar, namely, in wet and dry periods, the former the season of growth, and the latter that of rest; but the further inland the situation, the greater are the extremes of temperatures, and in some places the rainfall is excessive, amounting to hundreds of inches a year."

**Rambles in Switzerland.**

(Continued from page 200.)

Now for a few words on the vegetable products of the Swiss valleys, and first of these must be the fruit trees, for no object strikes a stranger more forcibly than the continuous orchards and vineyards which line both sides of all the roads in all these valleys.

The vineyards almost exclusively are confined to the mountain sides, where they blend with the valleys, and they do not, by their produce, deserve much further notice. With scarcely an exception, the wines manufactured from their Grapes are thin and acid, and not one is equal to good cider. The only exception was that to which was applied the not-over-refined name of *Liebfraumilch*—"Pretty Maid's Milk." I was laughingly told that we English expect every country like our own to have districts noted for something pleasant to the palate, such as our Yorkshire hams, Norfolk dumplings, and Cheshire cheeses, and to celebrate anniversaries by special eatables, as plum puddings at Christmas, buns on Good Friday, and pancakes on Shrove Tuesday. But I had an avalanche of instances to retort upon my assailant, for every Swiss town has some gourmandic speciality. Bale,

**Dendrobium × Leechianum.**

the first town within the Cantons, has its *leckerli*, a thick kind of parliament—I mean a cake, not an assembly of presumed wise men; and in every town I passed through there was some notable eatable, until I escaped through the last municipality, Geneva, without being made dyspeptic by its gingerbread.

The Pear trees are next predominant in numbers, for their fruit, as I have already mentioned, is cut into halves, dried, and consumed largely in winter. It was too early in the summer for me to ascertain the chief varieties cultivated, but ripe Little Muscats were then (the first half of July) plentiful in the markets. The Cherries—*Bigarraus*, *Black Hearts*, and a red Flemish, were also very abundant, selling retail at the rate of 2½lb for 4d. Walnut trees are numerous everywhere, but Apple trees are scant, and Plum trees still more rare. Bilberries and Alpine Strawberries were plentiful in the markets, and by the roadsides where shaded by trees. Of kitchen vegetables there were abundance of all kinds common in our markets, and the only peculiarity I noticed was that more white Carrots were offered for sale than those that are red-rooted.

Of ornamental trees, the prevalence of the *Catalpa* is remarkable, and especially for the freedom of its blooming.

*Tilia microphylla* is also quite as much cultivated as is the common Lime, or Linden tree, with us. Its foliage is not so bold as that of the latter, but its flowers are far more abundant, open earlier, and are more fragrant.

Of the wild flowers I can say but little, for I had to pass rapidly through the districts where the Alpine Flora is richest. Two plants, however, must attract even the notice of eyes looking from the windows of a railway carriage—the red-berried Elder (*Sambucus racemosa*), and the yellow Fox-glove (*Digitalis lutea*). Why are they not more cultivated in England? They are very ornamental. Then the Campanulas are strikingly numerous. There are thirteen species in the vicinity of Lucerne, ranging from the *C. pusilla*, barely an inch high, to the *C. pyramidalis*, which is 4ft. All I saw impressed me with the opinion that they were deeper in colour and larger in flower than the same species which I had seen in other European countries.

The Alpine Forget-me-not, only found in this country on the summits of the Breadalbane mountains, cheered me with its bright blue eyes everywhere; while the 'Alpine Lady's Mantle' spread its grey satiny leaves, along with the Arctic Willow, the favourite food of the chamois, over the stony knolls, as if in pity for their nakedness. I found a few specimens of the beautiful lilac *Soldanella alpina*, and also several tufts of the glacier *Ranunculus*, on a kind of morain at the foot of a hardened snow-wreath. The *Ranunculus* was higher up, and grew on the loose debris, without a particle of verdure around it. It seemed like the last effort of expiring nature to fringe the limit of eternal snow with life.

On this hill (Mont Chenaletta), composed of very friable schistose rock, I gathered a considerable number of very interesting plants peculiar to the Alps. The *Arnica montana* displayed its large yellow composite flowers in the shady recesses of the rocks; and, as if to illustrate the proverb that the antidote is ever beside the evil, I found its juicy stems very serviceable in healing a bruise on the leg which I got from a falling stone when gathering specimens. Another composite plant, the *Chrysanthemum alpinum*, whitened in thousands the slopes of debris. It has been observed, with *Phyteuma pauciflora*, beside the Lys glacier on Monte Rosa, at 11,352ft. Nothing could exceed the beauty and luxuriance of the patches of *Linaria alpina*, covered with a profusion of orange and purple labiate blossoms, which spread everywhere over the loose soil. No less striking were the sheets of Forget-me-not-like flowers, blue as the sky itself, produced by the *Eritrichium nanum*, growing in the moist sunny fissures. At the base of the hill on the Italian side, where there was a slight tinge of grassy verdure, the yellow Star of Bethlehem (*Ornithogalum fistulosum*) and the *Nigritella angustifolia* struggled into existence. The former rises an inch or two above the soil, and produces two or three brilliantly yellow flowers on each stem; while the compact showy heads of deep blackish crimson flowers of the latter, springing from very short and very narrow leaves, diffuse a fine vanilla-like fragrance. At lower elevations they grow in great profusion, and form the finest ornaments of the Alpine pastures.

Among the Saxifrages which I observed growing more or less plentifully were the *S. androsacea* (of which I could get no specimen perfect, for the marmot is so fond of it that it nibbles its stems, leaves, and flowers all round), the *S. bryoides*, *Aizoon*, *biflora*, *cæsia*, and *muscoïdes*. A short distance below the summit there were several large snow-wreaths. Their perpetual drip nourished a glowing little colony of the unrivalled *Gentiana bavarica*, and the compact sheets of the *Androsace glacialis*, sprinkled over with bright pink solitary flowers. In one place there was a curious natural conservatory. The under surface of the snow having been melted by the warmth of the soil—which in Alpine regions is always markedly higher than that of the air—was not in contact with it. A snowy vault was thus formed, glazed on the top with thin plates of transparent ice; and here grew a most lovely cushion of the *Aretia helvetica*, covered with hundreds of its delicate rosy flowers, like a miniature *Hydrangea* blossom. The dark colour of the soil favoured the absorption of heat; and, prisoned in its crystal cave, this little fairy grew and blossomed securely from the very heart of winter, the unfavourable circumstances around all seeming so many ministers of good, increasing its strength and enhancing its loveliness.—W. J.

(To be concluded.)

## South African Market Gardening.

The market gardener is to a considerable extent a yet unknown quantity in South Africa. In the Transvaal this is especially the case. There has always been a good market for all kinds of garden produce in Johannesburg, but the demand has invariably been greater than the supply. The same remark applies to most of the towns and villages in South Africa, with the exception of Cape Town, and here vegetables such as Cabbages, Peas, Beans, and Tomatoes can be obtained at reasonable prices. In Natal the "market gardens" are almost entirely in the hands of the coolies. These people were originally brought over from India under indentures to work on the railways for a certain number of years.

After their period of service expired they took up plots on the land between Durban and Pietermaritzburg. They have turned their attention principally to fruit and keep the market well supplied with Bananas and Pine Apples, which can generally be bought at the rate of 2s. per 100 for the former, and six for a shilling of the latter. They are not market gardeners in reality, though they are called so. Chinamen are popularly supposed to be excellent market gardeners, at least this is the opinion held in Australia and the Pacific coast. Some of these people have at times settled down in the Colonies and started gardens, but Europeans in Africa will have no dealings with them, and they have had to turn their attention to trading with the natives.

The Boers, as a rule, live on Pumpkins. This is their one vegetable food. Pumpkins are no trouble to grow, they are also no trouble to prepare for the table, and it is hard to enter a Boer homestead at the dinner hour without finding this vegetable on the table. Pumpkin is very well in its way, but Englishmen soon tire of it and look for others, which as a rule they cannot get. On the mines along the Witwatersrand reef the great difficulty the men had to contend with was the absence of all green food. Many of these mines employed as many as five or six hundred Europeans, and it is not going beyond the mark to say that the white men on the reef would have disposed of enough garden produce to have kept dozens of gardeners busy, but no attempt was ever made to supply them. The writer lived on one occasion for about a year on a mine situate about ten miles from Johannesburg, and during that period the only vegetable he partook of, leaving the inevitable Pumpkin on one side, were of the potted variety.

After the present difficulties are satisfactorily settled, there will be great openings for qualified market gardeners in Africa. The climate is all that could be desired. Labour is cheap, natives can be engaged to work for 15s. a month, and their food; the latter consisting of maize with an occasional supply of meat, costs very little. With a growing population, ever increasing markets will be opened up in all the large towns and villages of the colonies and the Transvaal. A few years ago an expert travelled through the country districts of the Cape and Natal giving lectures on dairy farming. This gentleman was despatched on this errand by the Government, and the farmers came in in numbers to listen to him and to ask his advice, since which a great improvement in the supply of dairy produce has been noticeable. The market gardener, however, has been altogether neglected.—D. G. R.

[It is certain the opinion expressed above will be justified by the development of a market gardening industry in the neighbourhood intervening between Johannesburg and Pretoria, which lie some fifty miles apart. There the marvels witnessed at Melbourne and San Francisco during the second decade of their existence—1860-1870—are sure of being reproduced, so that ten years hence a population of some two hundred thousand or more will be crying for fresh vegetable food during the summer months. The demand for Peas, Cauliflowers, Cabbages, Tomatoes, Melons, Potatoes and Brussels Sprouts will be enormous. But intending emigrants should recollect that, compared with England, it is an arid land, and the soil can only be kept moist and friable during the winter and spring months by continual watering or even irrigation, if good results in market garden produce are to be obtained. Then with the summer come swamping thunderstorms and often astounding hailstorms, which destroy unprotected vegetables and fruits.]

Hence the newcomer must have a little capital if he wishes to secure the first fruits of the new condition of things. So wonderful, however, are the productive properties of the soil when plentifully irrigated, that a skilful cultivator will rapidly reap the reward of his labours in the matter of produce, while for the first half a dozen years prices will undoubtedly rule high. It may be said that in mining communities market gardening is the one industry which is not overdone. Moreover, the Rand is not in the nature of a precarious alluvial mining camp, but a centre of solid wealth, which will attract the class of luxurious persons who consume fresh food in large quantities. Pastoral farmers like the Boers and isolated miners gradually learn to dispense with fresh butter, cream, milk, and vegetables. In countries such as

Australia and South Africa there is no verdant landscape or dairy farming scenery, and "a farm" is the last place at which to procure the aforesaid necessities of European life. These things are only developed within easy distance of the most populous districts—one of which the Rand is certain to become.]

## An Evening with the Microscope.\*

(Concluded from page 203.)

The most interesting members of the class Arachnidae, and well-known to all of us, are the common red spider which infests our plants, and also the cheese mite, both of which, when viewed under the microscope, have the appearance of great beetles marching about. As regards the parasites of birds, animals and human beings, it is a most remarkable fact that those of nearly every genera differ in size, although they are practically the same in formation. For instance there are the large and small fleas; the large and small lice, &c. Let us take the acari of the linnet, humming bird, swallow, starling, ferret, goose or hare; the parasite of the rat, red deer, hornbill, horse, pig; the flea of the cat, dog, pig, fowl, human being, all much resemble each other in their respective genera, and existing as males and females. As regards the parasites of human beings, probably the most common and the least known is the *Demodex folliculorum* that infests the follicles of the skin, more particularly the nose, and few people are without them. You have seen dark and mattery spots on the nose, and people squeeze them up with their fingers and out comes a little matter which contains the *demodex*, a very minute insect, but under high powers of the microscope it has the appearance of a long very thin kidney potato, or very thick worm, with four legs on each side of the upper portion of the body. It is figured in Messrs. Beck's book on the Microscope, magnified 900 linear, also in the Micrographic Dictionary, and we are told by a highly experienced man that one of the varieties of mange in dogs is caused by the *Demodex folliculorum*, and that no permanent cure is known, while the parasite that causes mange in the horse is of a totally different character, and very much resembles the cheese mite.

*Waldsteinia trifolia.* (See page 218.)

One of the most dreaded parasites to cattle is the gad-fly (*Tabanus*). They deposit their eggs by means of their ovipositors, under the skin of animals, where they remain to hatch out, and are for some time very troublesome. Animals so infested are easily detected by swollen humps, generally on their backs and sides. The eggs, larvæ, and portions of this insect are very interesting microscopic subjects.

Hydra or fresh water polypes are also most interesting microscopic subjects. They are to fresh water insects what the octopus and *Physalia pelagica*, or Portuguese man-of-war, is to living beings in the sea. They are of most remarkable construction, and common in almost every pond of fresh water. There are four or five British species. When contracted they appear like balls of jelly, about six-tenths of an inch in diameter, and are found adhering to sticks that may be in the water, stones, leaf stems, &c.; in fact, they attach themselves to any substance by means of their tails. They have a body, a number of tentacles or feelers, a mouth, but no eyes. They throw out their feelers or tentacles into the water, and the moment a water mite, insect, or worm touches them, they are instantly seized, drawn up into the stomach, and all nutriment sucked out of them. The victim is then disgorged, and if there is any portion left that the stomach could not hold, the remainder is treated in the same way.

Doubtless our best authority on this subject was the late Henry Baker, Esq., F.R.S., who made long experiments with them, and published the results in book form in 1743, being a series of letters of his experience to Martin Foulkes, Esq., then President of the Royal Society. There are many illustrations of them in his work, some showing the captured worm. Again, in Quekett's Lectures, and in Mantell's "Invisible World," published in 1850, there is a coloured illustration showing the worm captured, and also in the stomach of the animal. As regards the numerous water fleas and fresh water mites, these are remarkably interesting when viewed alive in water in the zoophyte trough.

Spicules of sponges and gorgonias, sections of the spines of *Echinus* (Sea-urchin), *spatangus* (Heart-urchin or Sea-bun), *holothuria* (sea cucumber), *ophiocoma rosula* (British star fish), young oysters, foraminifera and *Polycistma* are all remarkably beautiful subjects for the microscope.

Micro-photographs also claim a share of attention, whether they are copies of Scripture extracts, pictures, or views of various parts of the country. For instance, just picture to yourself Sir Walter Scott's monument in Edinburgh, or the Pagoda and fountain at Alton Towers being mounted on slides, the subjects themselves not being larger than the head of a pin, and quite indiscernible to the naked eye.

Of minerals I have a good collection, and it would puzzle me to say which are the most beautiful and interesting—those mounted as opaque objects, or those for transparent and polarised light. As regards polarised light there are a great many subjects mounted for this purpose—animal, vegetable, mineral, chemical, and crystals. Probably none are more beautiful than a section of the horn of a rhinoceros, the tendon of an ostrich, crystals of sulphate of copper and magnesia, or crystallised salicine; but there are abundance of them equally beautiful.

As regards anatomy (human and animal), pathology, histology, morbid and other diseases, I have a collection of over 1,000 slides on these subjects, and 6,000 slides in all, I think sufficient has now been said, although, if time would allow, some of these are most beautiful and full of interest. As in all other branches of study, it is very necessary to have some good books on the subject to refer to. I have found the following very useful from which to gather information which I possess, viz.:—

Lindley's School Botany  
Lindley's Vegetable Kingdom  
The Treasury of Botany, 2 vols., by  
Lindley and Moore  
Withering's British Plants, condensed  
by Macgillivray  
Hooker's British Flora  
The Microscope, by Lardner  
The Achromatic Microscope, by Beck  
Microscopic Science, 2 vols., by Cole  
The Microscope, by Dr. Carpenter  
The Microscope, by Dr. Carpenter,  
edited by Dallinger, last edition  
Microscopic Anatomy of the Human  
Body, 2 vols., by Hassell  
The Invisible World, by Mantell  
Micrographic Dictionary, by Griffith  
and Henfrey  
Outlines of Practical History, by Stir-  
ling  
Elements of Histology, by Klein  
History of Polypes, by Baker  
Textbook of the Microscope, by Griffith

Spectrum Analysis, by Roscoe  
Spectrum Analysis, by Schellens  
British Zoophytes or Corallines, by  
Landsborough  
Manual of Zoology, by Nicholson  
Infusoria (Diatomaceæ and Desmi-  
daceæ), by Pritchard  
Microscopic Fungus (Rust, Insect,  
Mildew, and Mould), by Cooke

Cassell's Natural History, 6 vols.  
Voyage of the Challenger, by Sir  
Wyville Thomson, 2 vols.  
&c., &c.

\* Paper read by Mr. J. Ollerhead at a meeting of the Wimbledon and District Gardeners' Mutual Improvement Society, February 17th, 1902, the subject being again brought forward on March 17th, after a discussion on Roses in pots.

#### **Maranta insignis.**

This is a very distinct and striking Maranta introduced from Brazil. It has long, semi-erect, lanceolate leaves of a light green colour, darkly shaded on the margins, and ornamented on the central portion with very dark green oval blotches, arranged alternately, a small round blotch being oppositely placed on each side of the midrib. The under sides of the leaves are of a bright maroon red colour. Messrs. Wm. Bull and Sons, of the Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W., exhibited a specimen of this Maranta before the Royal Horticultural Society's Floral Committee, on July 22, when they received an Award of Merit. (See illustration.)

#### **Sternbergia lutea.**

Included amongst the most beautiful of flowering bulbous plants is *Sternbergia lutea*, the Yellow Star Flower, or Winter Daffodil. The yellow perianth, or flower tube, is from 1½ in to 2½ in long, and funnel shaped. The flowers shoot up from the dark green linear foliage, and give a handsome effect. It is a popular and beautiful flower. For pot culture, or for sandy loams in sheltered borders out of doors, it is to be recommended. Mr. Robinson says: "One source of failure with *Sternbergias* and other bulbs is moving them at the wrong time, or before growth has fully developed. What they want is thorough ripening in summer and a slight protection during the winter." The bulbs of *S. lutea* must be large before they will flower freely, and imported bulbs are generally small, and will take a year or two to attain flowering size.

#### **Application of the Word Bergamot.**

A useful lesson is afforded (says "Meehans' Monthly") by the Bergamot as to the employment of common names. Botanists complain of the trouble they have to identify plants under these names, yet take little pains to ascertain priority, but adopt whatever the fancy of the moment may suggest. Thus Dr. Gray, in his "Synoptical Flora," employs the name "Horse Mint" for the whole genus, while but one species, *Monarda punctata*, is so designated by common people. Britton and Brown, in the "Illustrated Flora," class most of them as "Bergamot," which is really the most generally accepted of by the people, yet excluding *Monarda didyma*, which of all in gardens is known as the Bergamot plant. However, the term Bergamot is applied in some form or another to most of the species, though, as in the one now illustrated, the peculiar scent implied by the name is confined to but a few. Bergamot, in pharmacy, is obtained from the rind of a species of the Lemon family, and is known as the oil of Bergamot. This odour is especially characteristic of *Monarda didyma*.

#### **Japanese Irises.**

Every year sees the demand increase for Japanese Irises, as they have so many valuable qualities. They do not interfere with the possessing of other sorts, as they flower in July, after other kinds have done blooming. While single clumps are lovely, it is only when seen in great masses that one realises their availability for the producing of grand effects. Put together a hundred of them, or half this number, let the group be all one colour or a combination of colours, and for a spectacle of grandeur I do not know of any other flower that could produce it. There are early and late sorts, tall and medium growers, so that by attention to these points a year in advance, a superb, symmetrical bed could be formed. Still another thing in their favour is their water-loving habits. Many a low, moist piece of ground, in which hardly another plant will grow, would be found an ideal place for this species. In this respect it is in accord with our wild species, *Iris versicolor*, which is always looked for in such wet situations. Those wishing to propagate these Irises can do so at this time to advantage. Split them apart, reset them firmly, reducing the foliage a little, and by autumn each will be a nice clump. Other Irises can be treated in a similar way, but unless in damp ground they do not "take hold" as quickly as the others do.

#### **Waldsteinia trifolia.**

A pretty yellow flowered little hardy plant, with leaves not unlike those of a Geum, the flowers being carried, and of the form and size of those shown in the illustration on another page. We have not found any difficulty in its culture, it thriving in any ordinary garden soil on dry banks, or in the rock garden.

#### **Conference Pear.**

This most useful variety was named in commemoration of the National Pear Conference of 1885, and has gradually won a way for itself, till to-day it is probably grown in every collection. Messrs. Rivers and Son were the raisers of it. As a show Pear it has great merits, being elegant in form, and in colour a dark green, the skin being dotted with russet. The flesh is melting, juicy, and rich, yellow in tint, the fruits being in use from November 1 to third week. The raisers' description is as follows: "Fruit large, pyriform; skin dark green and russet; flesh salmon coloured, melting, juicy, and rich. Tree robust and hardy. Very prolific, a good garden and orchard fruit, and a valuable market sort. November 1 to third week. F. C."

#### **Blood-leaved Weeping Beech.**

The European Beech, *Fagus sylvatica*, has given us many nice varieties. Besides many green-leaved forms other than the cut-leaved and the Fern-leaved, there are the green-leaved weeping, the blood-leaved, and, later, the blood-leaved weeping, the one to which these notes are principally intended to refer. This subject has been before the public for some time, yet but very few collections have it. It is a beautiful tree, in my opinion (says Mr. Meehan). The appearance of its drooping branches please, drooping gracefully, which cannot be said of all weepers. Then add the blood-coloured foliage, and a very meritorious tree is obtained. It does not seem well known in nurseries as yet, so that would-be purchasers have no opportunity of securing it. Those who have it and wish to propagate it, could inarch it on any other Beech near enough to it for the purpose. If not now, a few suitable plants of green-leaved ones could be planted around it in the fall, ready for the work of inarching in the following summer. Inarching and grafting are the two principal methods of increasing Beeches.

#### **Are Plant Diseases Hereditary?**

A discussion of this question has lately occupied some of the readers of the "American Florists' Exchange," and Mr. F. C. Stewart, of the New York Experiment Station, contributes the letter which we print as follows: No plant disease with which I am familiar can properly be said to be hereditary. However, there are several fungous and bacterial diseases which attack directly the seeds, cuttings, bulbs, tubers, &c., used in propagation; and in such cases the resulting plants are exposed to infection almost from the beginning of their growth. The Bean pod-spot, or anthracnose, is a good example. A Bean plant affected by this disease may produce some perfectly healthy beans and some diseased ones showing brown spots. When planted, the healthy beans will produce healthy plants unless infection occurs from other sources than the seed. But the diseased beans are likely to produce diseased plants, for the reason that the fungus which is the cause of the disease is already present in the tissues of the seed in such close proximity to the stem of the seedling that the latter is almost certain to become infected. Thus, we have here not a case of heredity, but simply infection passing from seed to seedling in practically the same manner that it would pass from one plant to another. Carnation rust is caused by a parasitic fungus which thrives much better upon some varieties than upon others. Varieties especially susceptible to rust should be avoided by the originator of new kinds, because plants from the seed of such varieties are likely to inherit a tendency to rust. It seems to me very improbable that Carnation rust can be transmitted by means of the seed except in cases where the spores of rust are accidentally brought into contact with the seeds and adhere to them. This is not heredity. To the second sentence in the quotation from Professor Hartig I take exceptions. Diseased seed often causes loss in crops. In some cases the fungus causing the disease attacks the seed directly, like the Bean anthracnose, while in others the spores merely adhere to the seed, as, for example, the grain smuts. While it is true that with some diseases there is no danger of transmitting them by means of the seed, there are many others which are commonly disseminated in that way.

## Summer Bedding.

(Continued from page 202.)

The various wares of my business-pack were laid before the patrons of the Journal a week ago, and how to fit them together or describe a use for them will occupy a few moments erstwhile. Not to bandy words, and to adhere still to the concise form of treatment, the notes relating to the plants combined in the beds I have seen will be severely brief. These notes or descriptions are strictly a record of harmonious bedding effects, for use as a guide to those many readers of this newspaper who may never have had a personal opportunity to see the arrangements for themselves, and it may be well to remark again that ordinary bedding in private gardens is inferior to that in the larger metropolitan parks, and there are a number of reasons, good reasons too, why this may be. There are always some gardeners, however, to their credit it is said, who are anxious to improve their bedding effects, and to them such notes as these are doubtless useful. The park superintendents have not fruit crops to think of, nor have they to supply the cook with a continuous selection of vegetables, and a score of other things demanded of the professional private gardener, are not within their practice or province. One of their greatest qualifications and chiefest objects is to "bed-out" in the very best fashion, to create beautiful colour harmonies or effective contrasts, and to show the general public the possibilities of plants to present a pleasurable combination when chosen and grouped by one skilled in his art and tasteful in judgment.

To enumerate a few of the simple arrangements is our endeavour now. The old-fashioned and somewhat neglected *Calceolaria amplexicaulis* makes a fine bed by itself, edged with *Ajuga reptans purpurea*. The *Calceolaria* requires to be staked.

*Fuchsia Scarcity* (dark crimson flowers) goes handsomely with large, well grown plants of *Artemisia arborescens*, with Musk below, on the ground, and edged with blue *Lobelia*.

*Lantana delicatissima* I find is but little known. Grown to a single stem with the laterals developed, it and its mauve-purple flower heads are very effective. In Hyde Park, where these notes were taken, Mr. Browne has employed this with a *Ferula*-like plant, but which grows only 2½ ft high, named *Oreocome Candollet*; the edge was of *Alternanthera amœna*.

*Abelia rupestris*—nice graceful plants—with small samples of *Amaranthus tricolor* on the ground between the shrubs, and edged *Alternanthera amœna*, was handsomer and more graceful than I am sure these notes would lead one to suppose.

Crimson tuberous *Begonias* over *Koenigia maritima*, with *Grevillea robusta* enlightening the effect, and edged with *Lobelia pumila magnifica* (blue), was exceedingly pretty. At Hampton Court almost the same combination was seen, only that *Mesembryanthemum cordifolium variegatum* was used in place of the *Koenigia* (a dwarf, white flowering plant) and *Eulalia gracillima* instead of *Grevilleas*.

Foliage effect was secured in a round bed by the intermixture of dark-leaved *Cannas*, variegated Maize, and *Centaurea candidissima*. *Alonsoa incisifolia*, having blue *Violas* carpeting the ground, and an edge of *Alternanthera versicolor*, makes a very pretty bed. The *Alonsoa* may be grown 3 ft high and bushy, being supported by a stake.—D.

### "Business Illustrated."

We quote from the introductory note given in the first number of this new journal: "The especial function which 'Business Illustrated' has set itself to fulfil is the useful but unconventional one of supplying business people with a publication which stands midway between the trade and technical journals on the one hand, and the popular magazine on the other." This the new journal does admirably. It is a production which, given sufficient variety of contents, serious-minded persons will appreciate, from the fact that useful, even technical, information is imparted in interesting, readable form, along with abundance of illustrations. We observe that Messrs. Messenger and Co., the horticultural builders of Loughborough, are well noticed in the pioneer number of the paper, and the information in this article alone should commend "Business" (1s.) to workers in the greenhouse and garden. It will appear monthly.

*Maranta insignis.* (See page 213.)

## Mr. Henry Cannell, V.M.H.

Mr. H. Cannell hails from Swardestone, a small village near Norwich, and first saw the light in 1833. His parents were market gardeners, and there with his grandfather in his retiring life, the young grandson spent most of his time in the early '40's of the last century, in raising and growing Anemones, Tulips, Hepaticas, Primroses, &c., to send to market with fruit and vegetables. Thus he inherited the love of working amongst flowers.

In 1846, hearing that the streets of London were paved with gold, and having a strong desire to verify the truth of this, he migrated to the Big City, and to his astonishment found in Oxford Street that the said gold was only wood.

After a good many ups and downs to shake off his youth, we find him in 1855 in a gardener's situation at Berry House, Tulse Hill, and beating all other growers in London with Fuchsias, which were then highly popular. At the first show held in the arcade at South Kensington, he was again as victorious as before. Dr. Lindley, then Editor of the "Gardeners' Chronicle," spoke of one of his exhibits there as follows:

"'Gardeners' Chronicle,' 1862: Of Fuchsias an admirably grown collection was shown by Mr. Cannell. It consisted of medium-sized conical plants, every one of which nearly covered their pots with gracefully drooping branches laden with flowers. Than this group nothing in its way could possibly be more perfect, and it received, as it well deserved, universal admiration. Very much larger plants were contributed by Messrs. Webb, Gardiner, Harper, and Higgs; but as regards fine growth they were considerably inferior to those just mentioned.—Royal Horticultural Society's Show."

We find him exhibiting at the Great International Show held on what is now the site of the Natural History Museum. In 1866 he carried away the first prize there for six specimens, and on another occasion, after Mr. Bray, then gardener at Baron Goldsmid's, Regent's Park, had for ten years straight off carried off the first prize of £10 at the Botanic Gardens, young Cannell stepped in with six of his fine plants, 8 ft to 10 ft high, and changed the whole future of Fuchsia growing and exhibiting.

Further particulars of his eventful life will appear later, but would conclude meanwhile by referring to the fact that Mr. Cannell has just been awarded the "blue ribbon" of English horticulture, viz., the Victoria Medal of Honour, by the Council of the Royal Horticultural Society.

#### **Chrysanthemum C. W. Payne.**

This is a sport obtained from that very late white, Princess Victoria. It is blush pink, a pleasing tint. Late pink varieties are valuable for cutting purposes, and this is one of a very good type. The habit of the plant is capital, and the growth easy. It is the sort that will lift with a good ball of earth, and therefore one that is likely to be esteemed by market growers.

#### **Chrysanthemum Mrs. G. Carpenter.**

I am pleased with this almost discarded variety as a late pink. The colour is very dense and bright. The plant, too, has a bushy habit, and not over-tall. Its flowers, again, have quite a pleasing scent, much more noticeable than in the case of most Chrysanthemums. The blooms are of shaggy Japanese character, of medium size, and full. It should be tried as a cut-flower kind.

#### **Chrysanthemum Queen of the Exe.**

This variety has proved one of the best for market to bloom at Christmas. The flowers are like that popular white Nivus in build and size, but the great improvement in the newer variety is its freedom from attacks of the rust, whilst Nivus is one of the first to take it. The habit of the plant is good. It lifts well, and consequently one adapted for a method of culture now pretty much in vogue among market men. The flowers open slightly tinted, but when fully out they are of the purest white. It is a good one to last in a cut state, and the blooms are elegant in shape with fine substance.—H. S.

#### **English-raised Seedlings.**

"H. S.," writing in the spring time, did well to style the Hon. F. W. D. Smith as an uncertain variety. Has he ever seen a really meritorious bloom of this Japanese Chrysanthemum, I would ask? I have not only grown it and failed to produce a decent bloom, but I have never seen anyone else do so. There seems to be much wrong with its constitution. The colour is all that could be desired, but its lack of size and solidity is detrimental.—E. M.

#### **Regarding Sports.**

I know of but two instances where any contrary flower formation exists in a sport from that of its parent. These two instances are peculiar, and happened long ago. Mrs. Forsythe, reflexed, gave an incurved sport, John Bradner; and George Glenny, incurved, produced a reflexed variety, Mrs. Horril. In both instances the progeny retained colour identical with the parents. Is it right to call such as Ethel Amsden a flower at all? Is it not more a freak? It is a question unanswerable by the greatest scientist. It does seem a bit passing strange that there are so few sports now with so many varieties as compared with the number there were from ten to twenty years since. Take, for example, the quantity that sported in the incurved section only. The "Queens" and "Princesses," for example, were almost yearly giving instances of their adaptability to surprise the Chrysanthemum world. Edwin Molyneux was introduced from Japan by Mr. Cannell. Edith Tabor was raised from seed by Mr. Notcutt, the result of purchasing a half-crown packet of seed from Mr. H. J. Jones, a speculation that could not be regarded as anything but a profitable one; the variety is so charming and so lasting.—SADOC.

#### **The American Chrysanthemum Exhibition—Change of Date.**

The date of the above exhibition, to be held under the joint auspices of the Chrysanthemum Society of America and the Horticultural Society of Chicago, at the Art Institute, Chicago, was first set for November 4-8, but has now been changed to November 11-15 inclusive. This is the first exhibition attempted by the National Society, and the arrangements made for it by the local society are most satisfactory. The main exhibition hall is 60ft wide by 220ft long and 30ft high, with an annex 40ft by 80ft. The conference hall—a beautiful and commodious chamber—in the same building can be secured for meetings and discussions if necessary. More delightful and appropriate surroundings for the great Chrysanthemum renaissance of America could hardly be imagined, and the building is located in the very best section of the city for the accommodation of visitors of every class and from every direction. The preliminary list of premiums has been out some time, and copies of same may be had by addressing Edwin Lonsdale, Secretary, Chestnut Hill, Philadelphia, Pa., or E. A. Kanst, assistant secretary, 5700 Cottage Grove Avenue, Chicago.

## **The Culture of Richardias.**

Richardias kept in pots throughout the summer ought now, at the latest, to be repotted and started into fresh growth. Mix up some good, rich substantial compost of loam and manure with a free admixture of coarse silver sand. The plants are better for potting if the foliage has died down well, though if it has not completely withered up, it may be cut down to within a few inches of the surface of the soil, avoiding beheading any advancing young growth which may have started from the centre. Unless kept very dry the foliage turns yellow very slowly, and seldom loses its freshness altogether before new growth issues from the base. This, however, is immaterial. The main object must be to repot previous to much advance being made in the production of new growth, the plants suffering less from the necessary reduction of the roots.

On turning the plants out of the pots the balls will be found to be a mass of roots if the plants have been vigorous and healthy. The crocks originally placed in the pots as drainage will be completely surrounded with a network of roots. The ball may be sliced across above the crocks. If composed of several crowns each strong, divide into separate portions, reducing the soil and shortening the fibres of each portion to a convenient size for placing in pots which will hold them and admit of fresh soil working round. In the event of larger plants being required, those with several crowns may, after cutting away the crocks and loosening the sides of the ball of roots, be transferred to larger pots. Large pots can also be made up by introducing a number of equal sized single crowns, working soil between them and among the roots. The finest blooms or spathes are, however, produced from single crowns, providing they have been previously built up strong and healthy.

Lumpy material, either turf or flaky manure, should be spread over the drainage before introducing any soil, which may then be filled in and made slightly firm, but not raised too high for admitting the roots. Spread out loose roots, sprinkling soil among them, and make the rest firm by slightly ramming with a potting stick. When finished stand on a moist base of ashes in a partially shaded position at first. Give a copious watering to pass through the whole mass of roots and new compost.

For a short time afterwards it will be desirable to maintain the soil moist by frequent syringing rather than by heavy watering, but after the roots commence to push freely, and growth develops actively, supplies may be given when the surface soil dries. At this stage, too, stand the plants in a sunny position in order to develop them dwarf and sturdy. They are better in the open air until October, when it is necessary to accommodate them under glass in anticipation of the autumn frosts, which they are incapable of withstanding, even when only of a mild form, the foliage being extremely tender in this respect. This slight protection being afforded them, give all the air and light possible, and maintain the temperature cool, or they will grow more rapidly than is well for them.

If it is found that some plants are inclined to push flowering stems in November, encourage them to do so, as those plants which can thus early be induced to bloom remain with their flowers in a first-class condition for some time. They can also be induced to open their blooms better if provided with a little heat than they can with the same treatment later in the year. During the shortest days the blooms cannot be developed without a bottom heat of 60deg to 65deg, and the pots should be filled with roots.

Some growers of Richardias plant all their stock of plants out in the open garden in June in shallow trenches, so that water can be readily applied. The plants need but little attention until growth commences, when more water will be required in dry weather. The old withered foliage requires cutting away.

At the end of September or the first week in October lift and pot the plants. The size of pot will depend on the size of the ball of roots, but, of course, considerable reduction is necessary in order to conveniently admit them to reasonably sized pots. It is well to afford the plants a preliminary check about a week or ten days before lifting by running a spade round the clumps. Crock and have the pots in readiness, so that the lifting and potting may be expeditiously carried out.

Pots, not usually less than 8in diameter, should be employed, unless small offsets were planted, which will require smaller sizes.

When lifted give a preliminary trimming with a sharp spade, and finish smoothing the roots with a knife. Cut the ball as near as possible the size of the pot, removing plenty of the base, or it will not be possible to place the ball low enough. Having introduced it into the pot it may be shaken into position by a series of jars on hard ground. Then place the pots in slight shade and water well. In a few days stand them in the sun, and should frosts be probable, place under glass or under a wall with temporary protection. The subsequent treatment is the same as for all-the-year-round-grown pot plants. Liquid manure may be given when plants are pot-bound.—S. DENNIS.

## Diseased Melon Plants.

Having seen a bad case of this troublesome pest, and from attacks of which, from my own observation, I have concluded few places comparatively are entirely immune, it may not be uninteresting to record my own experience with it. I do not remember ever having seen the disease treated on from a scientific point of view, and enlightenment in that direction would perhaps place preventive or remedial measures in our hands.

My first acquaintance with it was in a house, which up to a certain stage, I considered then and now, held the most promising crop I had ever grown. The varieties numbered seven, and the seed was obtained from three sources. The plants were grown in the old fashioned way—i.e., on a hotbed of manure, but with hot-water pipes underneath, and in good yellow loam of a somewhat retentive nature, but in no way greasy. I much regretted at the time I had no rubble to keep it open. The plants grew very strongly, but set a good crop, and the fruits were

Mr. Henry Cannell, V.M.H.

(See page 219.)

swelling finely, but excepting a little artificial in the top-dressing no manure had been given, and the white roots were much in evidence all over the border.

After a practically sunless week with heavy rains at the end of May, during which little water was given, I noticed the surface roots were fast disappearing, and on brighter weather making its appearance the plants commenced flagging, and ultimately collapsed entirely before the fruits were finished, which, as it was, were of good size, but naturally lacking flavour. I could not hear of any such collapse taking place before. It would seem as if the extra vigour of the plants, combined with sunless weather, which prevented consolidation of growth, made them an easy prey to disease. But how did it originate?

The following season I was in another part of the country, in a garden where I believe Melons had been well grown, but had not been satisfactory for a season or so past, excepting in heated pits where a good hotbed of some depth was employed, and these were, of course, summer crops. I may say, too, only one variety was grown, and seed had been home-saved for years. For a reason it is not necessary to state here, a fresh stock had not been obtained. A little seed, however, was procured from an outside source which was believed to be free from suspicion of disease.

The plants in earliest house were, with the exception of four or five, all raised from home saved seed. Perhaps I ought in fairness to say, these four or five occupied a somewhat better position when planted out than some of the others, although this in itself was not sufficient to account for the difference which afterwards ensued. Some time after planting I noticed a kind of rust on the edges of the lower leaves on all but those plants raised from what I may term foreign seed, and none of these so affected

had the same vigour as the others. The rusted leaves gradually assumed a burnt up appearance long before the fruit was ripe, the stems up to the first wire were quite denuded of foliage. Occasionally a leaf on the higher part of the plants would appear as if badly scorched by sun, although no general scorching took place.

Many of the young fruits directly on the commencement of swelling became pitted all over and turned yellow, and, of course, ceased swelling, making it a somewhat difficult matter to secure a crop at once, although there was an abundant set.

As time went on there was the same mysterious disappearance of surface roots previously noted, which could not be accounted for by strong liquid or artificial manures, and none, not even those plants apparently healthy would stand bright sunshine all day without flagging, which seemed to point that all were now affected. The fruits finished fairly well for an early crop, and were said to be generally of good flavour, but curiously enough while the ripening process was going on, from time to time I would find a fruit with the juice exuding from the netting, and on cutting there was an escape of gas, suggesting that germination had taken place. The flavour, too, was anything but pleasant, giving one the idea that cayenne pepper had been applied to the lips.

Was this the sequel to the disease? Does the actual presence of the germ of the endophyte in the plant set up germination in the fruit? I had previously heard of fermentation taking place in fruits on plants which had had to be shaded, and I believe old growers look on the shading of Melons as rank heresy.

Further, on five occasions we attempted to obtain a second crop from one house in the same season, and in each case it was more or less unsatisfactory. It did not seem to make a great difference whether the beds and soil were partially or wholly renewed. The latter gave the best results, but in neither case was it a success. It appeared inexplicable, except on the ground of infected house and soil, and, of course, the increased debility of the plants as the season progressed, as I think I may say the earlier batches were well up to the average in crop, size, and flavour, although obviously diseased. In no case either could we induce the plants to grow sufficiently strong to mature a good crop unless grown upon a bed of leaves and manure. The latter seemed to give them the necessary vigour to struggle against disease.

Eelworm was present in all the soil we used, but at no time did I see any Melon roots infected with it, although Cucumbers usually collapsed from the ravages of that pest.

I used sulphate of iron, both in soil and in the water, as a remedy, but the result was not very marked. My own experience would tend to show that the disease is primarily embryonic, but that, as well, infection can take place from without, probably through the medium of the roots, but to be certain on these points requires a far greater scientific knowledge than I possess.—D.

We reprint the following replies bearing on disease in Melon plants, which have been given on three several occasions:—

*Sclerotinia sclerotiorum*, Mass., is the stem canker of Cucumbers and Melon plants, "sudden collapse" disease of Potatoes and Tomatoes. On the latter it is frequently confounded with "black stripe," "drooping," and "sleepy" disease, and occasions the destruction of the plants in a similar manner. On the stem of the plant forwarded there were the white threads of the fungus, and in the destroyed portion of the stem oval-shaped black bodies, somewhat elongated—the sclerotia or resting stage of the parasite. The fungus subsists on organic matter, especially vegetable, in a dead or diseased state. Quicklime acts more promptly than chalk or limestone, and is the most effectual preventive of stem-choking fungus, also of root or root stem fungi. "Stone" is better than "chalk" lime, but the lime must not be "magnesian" unless for applying to land made sour by heavy manuring, or surcharged with vegetable matter, as bog or moorland. As a precautionary measure 1lb per square yard should be employed, slaking without delay, and whilst flourey spreading evenly and mixing with the soil to a depth of 4in to 6in. This should be done when the ground is in good working order, preferably dry rather than wet, and afterwards using another dressing of air-slaked lime at the rate of ½lb per square yard, say when the crop is above ground, or as soon as set plants become established, will prove thoroughly effectual against this fungus in the matter of Cucumbers and Melons; at least, such is our experience of them in manure-heated frames and in houses. In case of attack, seldom seen until the plants are too far gone to admit of remedy, but usually noticeable by their being checked in growth, the stem becomes rough at the collar, as if affected with dry canker, promptly use quicklime at that part and for 6in distance from the stem, when the soil being dry and the surface more or less open, some of the lime will pass into it and coming in contact with the mycelium destroy it. When the plants collapse, remove the roots carefully and burn the whole of the plant, then disinfect the places where they have been with quicklime, working it well into the soil with a fork. Infested soil should be dressed

with from 2lb to 3lb of freshly burned lime per square yard, and, after slaking, mixing with the soil to a depth of 4in to 6in with a fork. (September 3, 1896, page 241.)

The stem of the Melon plant above ground was perfectly healthy, but the root-stem had a swollen appearance, while the smaller roots were free from the nodosities indicative of root-knot eelworm (*Heterodera radicola*). We did not find this pest, but in the root-stem, embedded in the cellular tissue or between it and the woody layer, the root-stem eelworm (*Tylenchus obtusus*) was plentiful, and this we regard as the cause of "the plant failing at the root before the Melons were hardly ripe." The soil is of a very fibrous nature, and in that the eelworm has possibly been introduced. We advise the careful removal of the root-stocks and burning them, then either soak the soil with gas liquor diluted with five times the bulk of water, or soluble phenyle, one part in 240 of soft water, or scald with boiling water. We have also found great benefit from the use of quicklime, about 2½ per cent, mixed with the soil in stacking, leaving until the herbage was completely dead. (August 11, 1898, page 116.)

The tubercles on Melon plant roots are caused by root-knot eelworm (*Heterodera radicola*), a minute creature about one two-hundredth inch in length in the adult stage. We failed to find the "worms as enclosed a box and the few killed by lime water." Possibly they were species of white worm, which are often associated with decaying vegetable matter, and may sometimes accelerate, if not actually cause, the destruction of living tissues. All the eelworms we found—eggs, cysts, so-called larvæ, free males and gravid females—were alive, and in no way affected prejudicially by the lime water if it had been used to effect their destruction. We mention this as you say "worms killed by lime water." We still find Little's soluble phenyle the most effective against these pests when the plants are growing, applying as in an ordinary watering at the rate of a fluid ounce to 3gals of water, repeating occasionally. A grower badly troubled with eelworm uses the phenyle at the strength quoted before planting and afterwards at half strength, or one part in 960 parts, and secures good crops of both Cucumbers and Melons where they were formerly failures. For general disinfection there is nothing better than scalding the soil and bed walls with boiling water. Where this cannot be done use 2lb of best freshly burned chalk-lime per square yard, slake, using as little water as possible to cause the lumps to fall into powder. Let it lie overnight, then work in with a fork a foot deep, taking small spits, and in a day or two apply half a pound kainit per square yard, forking in similarly to the lime after forty-eight hours. This should be done some time in advance of planting, or as a disinfectant when the plants are cleared. (September 22, 1898, page 236.)

## Pansies and Violas.

The value of Pansies and Violas for the decoration of beds and borders should not be overlooked. They are especially bright and floriferous in spring and early summer. Frequently they will continue all the summer to produce flowers. In a season like the present it is noticeable that the Pansies and Violas have succeeded admirably in producing a welcome succession of blooms. The Pansies, however, are not so fine as early in the season, the tendency being for the blooms to become smaller after the first lot, Violas are better adapted for summer flowering, and for this reason are employed in bedding arrangements and as edgings to borders. There are no better flowering plants for spring bedding than Pansies and Violas. The latter are often termed tufted Pansies. The blooms differ in usually being of a self colour with a distinct eye in the centre, and are of medium size. Pansies have blotches of colour on the three lower petals, usually of a dark colour, with a margin of another colour, the two upper petals being the same colour as margin, though sometimes the colour is suffused, veined, marked, or splashed. The whole flower is larger and more imposing, and the habit of the plant more straggling.

The season for propagating or preparing for autumn planting is now at hand, and a few notes on the various methods of preparing plants may be acceptable. Where there is no stock to fall back upon raising plants from seed is an admirable method. The seed is best sown in July and August. Sown now it should be in pots or shallow boxes under glass. Seedlings are pricked out when the third leaf is formed, from which time they will proceed to strengthen rapidly. Prick them out either outdoors in the open, or in frames or boxes. Vigorous seedlings put out now will make fine, sturdy plants for autumn planting. Seedlings ready for treatment may be purchased, or young stuff ready for final planting obtained later on. Autumn planting is not indispensable, therefore seedlings considered too small may be wintered in a frame and planted out in March or April following.

Division of the old plants is another method of increase. The flowering growths ought to be cut away some short time previous, thus encouraging new or sucker growth from the centres. When this is fairly developed lift the plants and divide into portions with roots attached. These young growths appear rather weakly, but if furnished with a fair number of healthy roots young and strong plants are soon produced and established. At the time of division, if they cannot be placed in permanent positions for flowering they can be transferred later or in the spring. Break up the ground well, adding a little decomposed manure, leaf soil, and wood ashes. The last method of increase is by cuttings. This plan is adopted when a stock of a particular colour or variety is wanted in quantity. Cuttings may be inserted in October in frames. Make up a bed of soil, which should be rather sandy near the surface, or surfaced with a layer of sand. Procure the slim growths from the base of the old plants, and prick out each singly 2in apart in rows 2in or 3in asunder. But little preparation of the cuttings is needed. Some will have small rootlets, the shortest being the best. See that each cutting is placed at the bottom of the hole made for it, which should be done with a blunt stick. Press the soil closely round, and when all is finished water well with a rosed can. Slight shade from strong sunshine is necessary. Place the lights on the frame, and keep close until the process of callusing has taken place—that is, a swelling at the base of the cutting. The cuttings will then remain fresh until roots form and ramify in the soil, during which time plenty of air should be given on favourable occasions. The plants may be placed out from the middle of March to early May, but always before they are likely to be affected by hot weather.—E. D. S.

## Tilgate House, Crawley.

The Weald of Sussex to the south of them, the Kentish North Downs in front of them, and unending view over forest, and mead and moor on right and left of them, the owners of Tilgate House, near Crawley in Sussex, enjoy that freedom, the fullest and best, which one involuntarily associates with such happy homes in rural England. Mrs. Nix and her two sons have indeed a beautiful estate, the residence situated nobly on an eminence not too much exposed, yet splendidly free, with shrub-dotted lawns around it, and a long smooth lake within a stone's throw in the valley which rises to form a Larch-clad belt upon the south. Everywhere on the southern side The Forest spreads, and bridle tracks, like sheep runs on a hillside, weave connections through the thousands of its acres. The cross-leaved Heath and the handsome Bracken flourish rampantly on every side, even beneath the shade of the full grown Larch trees, while in the open inclines, they predominate exclusively.

Tilgate House was visited in a hurry, for it is the way of some folks to attempt more than ought to be accomplished within the span of hours twenty-four, and I am one of them. But even he who runs could enjoy the delights of the lengthened drive through part of The Forest from Three Bridges railway station on the east side, and as the "House" was gained, the associated features of the beautiful Sussex vales intensified the interest and pleasure.

It was one of those hot summer days when the cattle in the meadows do nothing but chew their chud, and swish their tails to scare the flies; when haymakers swelteringly tussle the grass, and commotion has ceased. It is then that "Jack Rabbit" comes forth from his burrow, to coquet with "Bunnie" from over the way; he doesn't then mind the gun of the knowing gamekeeper. In the shady stillness of the darkened forest, robin red-breast is there, and maybe the wood dove too, or the crack-voiced male pheasant; and out in the sun the butterflies flit, or in the shade the dipterous kinds.

Tilgate House is built of light sandstone. It is thus cheerfully bright. The Douglas Firs have flourished well on the lawns surrounding it; not less so the Scottish Pine. There, too, is *Pinus insignis*, a very handsome tree and quite a picture. Near to the house stands an aged Tulip Tree, full 80ft in height. Some years ago this handsome favourite appeared ill in health, but Mr. Nix and the skilled head gardener, Mr. Edwin Neal, prescribed a simple and effective remedy, that of supplying more nourishment in the form of a top-dressing to the roots. It now is full of life and odorous blossoms. Lime trees do well, and there are some rich toned Purple Beeches in the grounds. From the north front there is a view of Leith Hill, a prominent landmark near Dorking, and the village of Hockstead lies in the same direction.

Among flowering shrubs that luxuriate, none excel the massive clumps of Rhododendrons, whose roots find nurture in the peaty soil. By a mossy path among the Beech trees one saunters to The Wilderness, a place where Nature is unbridled, yet adorned by additions to her own productions. Heaths and Ferns, and lovely grasses are hers; man (the gardenman) has

PANSIES AND VIOLAS (See page 222.)

added just a little. Here a *Phyllostachys*, there a mass of Crimson Rambler Rose, some groups of Golden Elders, and anon a batch of named distinctive *Rhododendrons*, and each harmonises. By a pretty cascade in this Wilderness scene, there are more Bamboos and broad-leaved herbaceous *Gunneras*, and completing the perfection of the features, we find the beautiful Japanese *Iris*s. These have become fully established, as have also the Bamboos in variety, and other shrubs as well. The grace of the Dragon-flies among the Reeds and Water Lilies, rivals the pleasure one has in seeing the red-skinned gold fish in the limpid depths of water, or the snow-white swans gliding over its glassy surface. The Water Lilies are *Marliac's* hybrids, and are now thoroughly established here.

*Liliums* are another speciality at Tilgate, and one may see many little grouplets peeping up from the edges of the *Rhododendron* and shrubbery belts. Mice prey upon the bulbs even out here in the open, but a very fine wire netting around each lot tends to save them. I noticed *Lilium Browni* doing handsomely, and others were *excelsum*, *croceum*, *giganteum*, and *Henryi*, the latter seemingly as fine as any in the open. Named *Rhododendrons* I have referred to, and among them *Pink Pearl*, the loveliest and best of all the hardy hybrids, was seen in robust health. Groups of *Penzance* hybrid Sweet Briars, with beds of fine-foliaged Japanese *Acers* further added quality to the general collections.

*Azalea mollis*, in variety, have recently been liberally planted in the new American garden (a term that is almost in desuetude now) which is being formed. It is very satisfactory to know that both the Messrs. Nix are keen and experienced at gardening. Mr. John A. Nix is a member of the Floral Committee of the Royal Horticultural Society, and Mr. Charles G. A. Nix sits on the Fruit and Vegetable Committee. The collection of fruit shown in the Drill Hall last September from the fruit ranges at Tilgate elicited much comment, and a Silver Knightian Medal was awarded for it.

Hardy flowers are not greatly in evidence, but there is an interesting little rockery which contains just those rare tit-bits, showing it to be in the hands of a real lover of Alpines. Hardy fruit on the open walls are growing and bearing in a manner which shows that skill is brought to bear on their culture. The soil by the walls in which they are planted is all "forced"—that is, it is specially selected soil brought and put there. Whenever the estate carter is out and about, if his cart is to be empty on the homeward journey, he has orders to seize the opportunity and bring back road-soil or turf parings if the latter are found.

Cherries were heavily laden, all varieties alike. Governor Wood and Black Tartarian are favourites and much grown. Pears and espalier Apples form quite a feature. Strawberries are grown under permanent screens which are 6ft high, the supports and rails being of iron. Roses are excellent and plentiful in the borders, and vegetables, too, are well attended to.

Indoor fruit is placed in the forefront at Tilgate, and many handsome houses with their trees and crops are to be seen. Mixed houses of Vines, the latter carrying heavy bunches and so many as sixteen and seventeen on each rod, were excellent in June, and no doubt London folks will be able to see some of the samples before long. All of these are certificates of able cultural attention. Muscat of Alexandria, even in June, was richly coloured, and it is seldom one sees the amber tint even at a later date.

In a new lean-to house, admirably erected by James Gray, of Chelsea, a number of standard trees have been planted in the centre of the border, their branches being trained up the wires towards the top. What is the object? This, to make the most of space: for while the younger trees are being trained from the bottom upward, and gaining space, the top portion of the roof is yielding a crop. The standard trees will come out in a couple of years, or less. So many as 1,000 fruits are yearly sent to the owners during their stay in Scotland.

Roses under glass are another feature worthy of remark, *Mme. Lambard*, *Anna Olivier*, *Maréchal Niel* and *Niphetos* among many others, being robust and prolific of blossom. Palms and decorative plants, both in the ranges and in the conservatory attached to the house, are varied, clean, shapely. Carnations and *Gloxinias* among flowering plants seemed to be popular. And so the visit, though brief, was very pleasurable, the more so as Mr. and Mrs. Neal did everything to add to the enjoyment of it. Tilgate House is quite in the country—I had almost said the wilds of the country, but it is hardly that—but just far enough out from towns and villages to make it truly rural and agreeable to those, who, like the owners here, can appreciate the charms and interest of the country and what it contains, because they have studied and understood something of it. The journey by foot through the aforementioned Forest (an old historic forest) was boldly undertaken, and though I had Mr. Neal as guide over half way, thrice, like the babes in the wood, was I lost, though not for long. Thus, au revoir.—J. H. D.

### Pears Destroyed by Grubs.

I am much obliged for information supplied through the Journal re the Marie Louise Pears eaten with grub. With regard to the strips of tin cure, I am afraid that would be a very laborious cure in the case of a gridiron trained tree some 8 yards long on wall. However, I shall try the kainit and the removal of the top soil. Had it not been for this pest I should have had some 400 fruits of Marie Louise, whereas there are about two dozen left. As I mentioned previously, *Doyenné du Comice* and *Williams' Bon Chrétien*, on the same wall, are untouched by the fly in question, but pyramids of the same and *Louise Bonne* have suffered in the same way.—W. SCOTT.

### Theoretical Training: A Defence.

May I again be allowed to trespass on your space Mr. Editor? In extenuation, I may say it is directly due to "An Old Boy" and one of his protégés that I ever possessed the necessary temerity to figure in your columns. Did not the former petition you in those articles I referred to last week for space for our then 'prentice efforts? I am glad "An Old Boy" read my contribution in the spirit in which it was intended, and I thank him for his kind, fatherly acknowledgment and good wishes, and hope we may again hear from him at some future time. I thought, however (I hope I am not mistaken), the sentence in "Kepouros" article, which runs: "The dingling sound of triangles—a sic unchristian, not to say uncabbage-like learning—leads to a peculiar form of mental aberration immensely inimical to the right about attention so necessary in the duly equipped practitioner in the art of gardening," seemed remarkably like an insidious "by break." Though in no way wishing to score off it, I must, in self-defence, endeavour to play it, and keep my end up with a straight bat.

Directly I read it I began to suspect him of being—a pro-Boer? Oh dear no! his letter would tend to point the other way—but one of the "horticultural Joshuas," into whose aspirations (!) with regard to the "Sun of knowledge" a correspondent gave us an insight some time ago. If we pleaded guilty to the indirect impeachment of conceit in one thing above another, it would be, perhaps, that we were level-headed, and endeavoured to see both sides of things as they are, and not as we would have them, that is, of course, those things over which our individual or united efforts can have no control; and we are not aware that any knowledge we may have acquired has in any of us produced that species of mental aberration with its attendant baneful effects to which "K." refers, and on which, apparently, he is well qualified to express an opinion. We certainly do not wish it to be assumed that we have imbibed so deeply at the classic fountain as he appears to have done, nor had we in our mind the probability of the various exigencies arising which he named, and for which he evidently is prepared, and which we therefore resign to his greater learning.

It may be that he is best acquainted with those—pardon me if I introduce the dingle once more—triangles, whose angles are said to possess the quality of obtuseness, and that consequently the metaphor I used was just a little far-fetched for his mind. I will not tire your readers by rendering it as it should be literally. We did, however, in our poor, simple-minded way, think it just possible we might be asked to work out a geometrical design in the parterre, or mark out an elliptical bed in the pleasure, or may be, an exact square might be wanted for a tennis or cricket ground, with, perhaps, a calculation as to quantities, levels, &c., or we might require to know how much head room a certain length rafter would give us in a house of stated width, and it may be, a plan to scale might be required for some proposed structural alterations we might like to effect, and in our aforementioned poor, simple-minded way, we concluded that a knowledge of geometry and kindred subjects would assist us in those little difficulties, and this too, as our friend puts it, "needs no demonstration, but is a self-evident truth." Further, we both hold and assert that a gardener first and foremost must be essentially practical, and this we have demonstrated in ourselves to the satisfaction of those whom it most intimately concerns, but, unfortunately for us, the testimony of practical men of high standing does not rank as influence in securing situations, nor do we find it such in effect.

The knowledge, too, which we may have gained is to the cultured mental palate decidedly cabbage-like, so much so, that at times we would fain that peculiarity had been less pronounced,

and that circumstances had given us opportunities for it to have acquired, as it were, a rounder, and more delicate flavour. Does it not appear to "Kepouros" (we really wish he had adopted a more intelligible nom de plume) that the palliative—savouring of wormwood—which he suggests to the "faithful genera" (men who are on their beam ends, and who, when in regular employ, have been privileged to earn barely more than sufficient to buy the necessities of life, with the addition, perhaps, of a few valued books, leaving just a margin for sickness and misfortune) that palliative, I say, is a trifle "unchristianlike," I might almost say gratuitously insulting to them.
